Criteria, methodology, and computer programs developed by the National Weather Service, U.S. Corps of Engineers, and the U.S. Geological Survey, for simulating a hypothetical dam failure are, in general, acceptable. Simplified methods usually do not provide sufficient detail to be considered acceptable except in emergency situations where time does not allow a more detailed analysis. Documentation explaining theoretical aspects of the mathematical models, forecast ability, simulation accuracy, computer input parameter requirements, etc. are available directly from these federal agencies.

I. Hydrologic & Hydraulic Design References

The following list is provided to aid the design engineer and is not intended to be a complete listing of all available reference material.

General

"Handbook of Applied Hydrology" by Ven Te Chow, McGraw-Hill Book Company

V. STRUCTURAL AND GEOTECHNICAL INVESTIGATIONS AND DESIGN

A. Geotechnical Investigations

For all dams an investigation of the foundation and abutment soils or bedrock and the borrow materials that are to be used to construct the dam should be made. The foundation and abutments investigation should consist of borings, test pits and other subsurface exploration necessary to clearly define the existing conditions. The appropriate field and laboratory tests to be made should be based on the magnitude and type of the dam, as well as the characteristics of the foundation deposits, abutments, and materials available for use in the embankment. Some of the common tests made are Standard Penetration Tests (N-Values), unconfined compressive strength (q_u) tests, direct shear tests, triaxial tests, water content tests, Atterberg-limit tests, particle size analysis tests, Standard Proctor moisture-density relations, permeability tests, consolidation tests, and dispersion tests. Soils should be at least classified according to the Unified Soil Classification System.

In general, for embankment dams greater than 30 feet in height, the foundation and embankment soil shear strengths for the unconsolidated-undrained (Q), consolidated-undrained (R), and consolidated-drained (S or $\bar{R}$) conditions are to be based on actual test data from the dam site. One half the unconfined compressive strength ($q_u/2$) is usually adequate for the unconsolidated-undrained (Q) condition.

For embankments 30 feet or less in height, at least the unconfined compressive strengths (q_u) and the standard Penetration Test (N-Values) of the soils are to be determined from actual test data, unless unusual foundation

conditions exist which require a more thorough investigation. It is recommended that the R and S or $\bar{R}$ condition soil strengths also be determined from actual test data from the dam site.

B. Earth and Rockfill Embankments -- Structural Stability.

The embankment and foundation should be analyzed for stability against failure from sliding, sloughing, or rotation along potential failure surfaces using a phi value of "0". The following loading conditions should be investigated:

Case	Loading Condition	Minimum Factor of Safety w/o Seismic Forces	Minimum Factor of Safety w/ Seismic Forces
I	End of Construction	1.3*	N/A
II	Steady Seepage	1.5**	1.0
III	Sudden Drawdown	1.2***	N/A

* For embankments over 50 feet high on relatively weak foundations, use a minimum factor of safety of 1.4.

** The submitted design will be reviewed for an effective stress condition. A review using S or $\bar{R}$ with c=0 will also be performed. Where the analysis relies on the cohesion component to meet the minimum factor of safety, an analysis of the soil chemistry may be required.

*** The factor of safety should not be less than 1.5 when the drawdown rate and pore water pressures developed from flow nets are used in the stability analyses.

Computations of factors of safety for various loading conditions and shear strengths are readily made using computer programs. Several computer programs are available for the completion of the analysis including those developed by the federal agencies and many universities.

Seismic activity should be considered in the design of all dams in Illinois. The Peak Ground Acceleration values for 2% probability of exceedance in 50 years is shown in Appendix 1. Dams located in an area with a peak acceleration greater than 20%g must have a seismic stability

analysis using equivalent static load methods included in the application submittal package. The values found in Appendix 1 should be the minimum coefficient. Dynamic analysis methods should also be considered for dams in areas of high seismic activity.

So that earth embankment side slopes can be easily maintained and/or mowed, it is recommended that the downstream slope be no steeper than 3:1. Crown vetch or similar types of ground cover should not be planted on the slopes of earth embankments because it severely restricts the ability to inspect the slopes for sloughing, erosion, seepage, animal holes or excessive settlement.

C. Earth Embankments -- Seepage.

Adequate analyses should be made of anticipated seepage rates and pressures through the embankment, foundation and abutments. The analyses should show that the seepage flow through the embankment, foundation and abutments will be controlled so that no internal erosion takes place and no sloughing takes place in the area where the seepage emerges.

D. Earth Embankments -- Conduits.

Conduits through earth embankments are to be a pressure type conduit, such as reinforced concrete pressure pipe or cast-in-place reinforced concrete. However, non-pressure type conduits properly detailed may be allowed for Class III dams, 30 feet or less in height. Reinforced concrete pipe should meet one of the following specifications:

(A) ASTM C 361
(B) AWWA C 300
(C) AWWA C 301
(D) AWWA C 302

Reinforced concrete pipe should be supported on a concrete bedding or cradle, and reinforced where spreading might be a factor. The pipe joints should incorporate a rubber gasket set in a positive groove as described in the above specifications which will prevent its displacement from either internal or external pressure under the required joint extensibility.

Conduits other than the reinforced concrete pipes listed above may be used. For those designs the application should fully document that the proposed conduit will provide performance equal or superior to reinforced concrete pressure pipe.

It is recommended that all conduits which pass through an embankment have a filter constructed at the downstream end of the conduit to control any seepage along the conduit regardless of whether anti-seep collars are used.

E. Concrete Dams and Structures.

Concrete dams and structures appurtenant to embankment dams should be capable of resisting overturning, sliding and overstressing with adequate factors of safety for normal and maximum loading conditions. Loadings to be considered in the stability analyses include the water load on the upstream face of the dam; the weight of the structure; internal hydrostatic pressures (uplift) within the body of the dam, at the base of the dam and within the foundation; earth and silt loads; ice pressure, seismic and thermal loads, and other loads as applicable. A gravity structure should be capable of resisting all overturning forces.

The analysis of concrete stresses should be based on in situ properties of the concrete and foundation. Tensile stresses in unreinforced concrete are acceptable only in locations where cracks will not adversely affect the overall performance and stability of the structure. Foundation stresses should be such as to provide adequate safety against failure of the foundation material under all loading conditions.

Sliding of concrete gravity structures and of abutment and foundation rock masses for all types of concrete dams should be evaluated by the shear-friction resistance concept. The investigation should be made along all potential sliding paths. The shear-friction safety factor is obtained by dividing the resistance, including the applicable downstream passive wedge if appropriate, by the summation of horizontal service loads. Computed sliding safety factors approximating 3 or more for all loading conditions without earthquake, and 1.5 including earthquake, should indicate satisfactory stability, depending upon the reliability of the strength parameters used in the analyses. Designs based on Corps of Engineers, Bureau of Reclamation, or Natural Resources Conservation Service criteria are generally acceptable.

F. Concrete Design.

The loadings, allowable stresses, load factors, and safety factors for the design of concrete structures should be those appropriate for hydraulic structures. Concrete design should be in accordance with the applicable sections of the latest edition of the "Building Code Requirements for

Reinforced Concrete" (ACI 318); however, because hydraulic structures are subjected to a relatively severe environment and unknown loading conditions, due consideration should be given to the allowable stresses or "Z" values used so that adequate crack control is achieved. Working stress and strength designs should be based on 28-day concrete strengths not less than 3000 psi.

The following minimum clear cover of main reinforcement should be used:

Structures exposed to weather, or backfill, or submerged and can be made accessible
Bar Size Nos. 5 and less - - - - - - - - - - - - - 1 1/2"

Structures exposed to weather, or backfill, or submerged and can be made accessible
Bar Size Nos. 6 through 18 - - - - - - - - - - - - 2"

Structures submerged and cannot be made accessible
All Bar Sizes - - - - - - - - - - - - - - - - - - - 2 1/2"

Concrete cast against and permanently exposed to earth or rock
All Bar Sizes - - - - - - - - - - - - - - - - - - - 3"

All concrete construction, contraction, and expansion joints subject to hydrostatic pressure should be protected by the use of waterstops or other means.

G. Steel Design.

Structural steel design should be based on the applicable sections of the latest edition of the American Institute of Steel Construction (AISC) specifications. The applicable sections of the latest edition of the Standard Specifications for Highway Bridges adopted by the American Association of State Highway and Transportation Officials (AASHTO) are acceptable, as well as designs prepared using Corps of Engineers, Natural Resources Conservation Service or Bureau of Reclamation specifications.

H. Spillways and Energy Dissipators.

The range of spillways and energy dissipator types which can be used on a dam project is very large. If a standard design is used, reference to the standard used is acceptable for the structural design documentation. If a non-standard design is proposed, the structural design computations submitted should be based on the commonly accepted principles of structural analysis and design.

Underdrains and/or anchors should be considered in the design of chute spillways.

I. Filters and Drains.

When filters and/or drainage blankets are required because of a significant difference between the gradation of the material to be protected and the material of the drain, they should be designed to provide for the controlled flow of the water while precluding the movement of embankment and filter materials. Examples of situations where filters may be required are zoned embankments, rockfill dams, pipe underdrain systems, and chimney drains and drainage blanket systems. Typical filter design criteria are shown in the Bureau of Reclamation's "Design of Small Dams" and "Earth Manual".

J. Geosynthetics.

Geosynthetics may be used in dams as filters, drains and impermeable membranes. An important aspect of the use of geosynthetics is the choice of the appropriate material and opening size. The use of geosynthetics at many construction sites are not as sensitive to this correct choice as at dams. Generalized use of geosynthetics does not assure their performance or acceptability. Detailed analysis must be completed to assure adequate constructability and functionality exists.

Geosynthetic materials are commonly used in filter and drain applications. The geosynthetic often replaces several layers of a granular design. Caution should be used in the adoption of standards developed for other engineered solutions. The assumptions and performance standards may not be consistent with those required for dam safety.

K. Riprap.

Riprap should be designed for its expected use and anticipated water velocities. All riprap should be placed on a properly designed bedding to prevent the loss of the underlying base material, unless the gradation of the underlying base material is such that it will not infiltrate through the riprap. Properly designed geosynthetic materials can be used to provide the bedding. For most riprap gradations a sand layer is required between the riprap and a geosynthetic material to prevent damage to the material during construction.

VI. OPERATION PLAN

A documented plan of operation for normal conditions, flood events, and emergency conditions is required. This plan should include availability of the damtender, means of communication between the damtender and his supervising authority, method of gate operation (manual, automatic or remote control), a list of the names, addresses, and telephone numbers of people and agencies to contact during normal and emergency conditions, and a list of standing instructions for normal, flood, and emergency conditions. The actions to be taken at the dam during an emergency condition are a portion of the emergency action plan for the dam which is described in a following section.

A copy of the operation plan should be provided to the damtender and kept at the project site. An example operation and maintenance plan is included as Appendix A. This example is for the purpose of providing generalized guidance in the development of the specific plans for the dam being designed and is not a required format.

VII. MAINTENANCE PLAN

A maintenance plan must be submitted which includes a listing of the equipment and manpower necessary and a time schedule for performing routine inspections and the inspections required in the "Rules for Construction and Maintenance of Dams". This plan should, at a minimum, address the following items: prevention of the growth of trees and brush on the embankment, on the abutment, on the downstream area a minimum distance of one-half the height of the dam or 20 ft. from the toe of the embankment whichever is greater, and within the spillway system; maintenance of adequate vegetation to prevent erosion of the embankment and earth spillway and the method by which the vegetation will be maintained to allow adequate visual inspection of the embankments, spillways, and crest of the dam; removal of debris or other deleterious materials from the spillway systems; inspections as necessary to insure that all gates, orifices, dissipators and other appurtenances and all mechanical and electrical equipment that affect the operation of the dam and reservoir are kept in good repair and working order; and a time schedule for test operation of all spillway and outlet gates or other equipment that must operate to pass flood flows. The OWR document entitled “Guidelines and Forms for Inspection of Illinois Dams” also

provides a generalized listing of the items to be inspected and therefore the items that need to be considered in the development of the maintenance plan. The maintenance plan should be specific to the dam.

A copy of the maintenance plan should be provided to the damtender and kept at the project site. A detailed record of all maintenance is required, including dates and results of routine inspections, and complete information on all maintenance, rehabilitation, and improvements. This record should also include data on the structural behavior of the dam embankment and spillway system for all major flood and seismic events.

An example operation and maintenance plan is included as Appendix A. This example is for the purpose of providing generalized guidance in the development of the specific plans for the dam being designed and is not a required format.

VIII. EMERGENCY ACTION PLAN

An emergency action plan is a formal document which identifies potential emergency conditions at a dam and specifies the procedures to be taken by various entities in response to the noted emergency. The plan should address: accidents at the dam which could affect the operation of the dam or present a hazard to areas downstream of the dam; impending flood conditions even though the dam may not be in danger; and the potential failure of the dam. The inundation mapping prepared as a portion of the dam breach analyses should be included in this plan.

Emergency action plans are necessary to provide early warning and notification of an emergency. Emergency action plans must be site specific. The plan for a dam must address not only the specific characteristics of the dam but also the capabilities and resources of the dam owner and the emergency responders. Due to its need to be unique, an example plan is deliberately not included in these guidelines. An appropriate format for the development of an emergency action plan is available in the document entitled "Federal Guidelines for Dam Safety: Emergency Action Planning for Dam Owners," prepared by the Interagency Committee on Dam Safety and the Federal Emergency Management Agency (FEMA-64).

OWR and the Illinois Emergency Management Agency offer a course on the development of emergency action plans for dams. Contact OWR's Division of Resource Management for schedule information.

IX. DAM REMOVALS AND ABANDONMENTS

This section provides guidance regarding the removal of dams and the abandonment of slurry disposal or similar material impoundment dams. However, both removal and abandonment usually result in the dam ultimately being eliminated from the Office of Water Resources regulatory purview.

Abandonment may differ from removal of a dam in that abandonment may leave the embankment intact. Dams which are typically considered for abandonment include slurry disposal, dredge disposal and fly ash disposal impoundment dams. The principles noted for the abandonment of these dams should be applicable to the abandonment of other similar structures.

B. INVESTIGATIONS AND EVALUATIONS FOR REMOVAL OF DAMS

The removal of a dam requires careful planning and design. The size, height, reservoir impounding capacity, upstream and downstream channel conditions, existing reservoir sediment deposits, degree of hazard in case of failure, as well as any other considerations which might be peculiar to a particular dam, all have impacts on the removal process.

A method to remove or reduce the stored water prior to initiating the breach of the dam must be determined. When available, use of the dam's dewatering structures would generally be the appropriate method of drawdown. For dams without dewatering structures, the installation of siphons or pumps may be an appropriate method. Items to consider in determining the drawdown rate should normally include the capacity of the dewatering structure, the flow into the reservoir from the tributary areas, the downstream channel's bank full flow capacity, and the affects of the speed of a reservoir drawdown on the embankment and shoreline.

The method to be used for the breach of the dam can vary from typical excavation with earth moving equipment for embankment dams to controlled blasting for concrete dams. The time necessary to accomplish the breach and the flows which may enter the reservoir during that time should be considered in determining the method.

The size of the breach, width and depth, needs to be large enough that a potential failure of the remaining portion of the dam and resultant release of stored water does not cause a significant increase in downstream water surface elevations. To prevent downstream damage, an assessment of water surface elevations at the breach is used as a means to establish the necessary breach size for flows up to and including the 100-year frequency flood. For configurations where the breach opening will be to the invert elevation of the channel at the downstream toe, a backwater analysis from the downstream channel and floodplain cross section to a natural channel and floodplain cross section located upstream of the dam can be used for the assessment. If a comparison of the increase in water surface elevations for the "with the dam" condition including the breach to the "without the entire dam" condition shows the increase to be less than 1 ft. in a rural area or 0.5 ft. in an urban area, the opening is considered to have a negligible backwater effect. For configurations where the breach opening will not be to the downstream channel invert (which is typical of sites for which a drop structure at the elevation of the sediment level in the reservoir is proposed), the water surface elevation comparison should be for a cross section at the upstream toe of the dam for the "with the dam" condition including the breach to the "without the entire dam" condition.

Sediment control during and after the breach must be considered for the removal of a dam. For the configuration where the breach opening will be to the invert elevation of the channel at the downstream toe and a structure to control the headcutting of the channel through the sediment is not proposed, the re-establishment of a channel in the reservoir bed to match the channel downstream of the dam is typically proposed. For the configuration where a structure is proposed to control the headcutting or to make the bottom of the breach at the top of the sediment in the reservoir, the structure and the distance through the breach opening to the downstream channel should be designed and constructed to be stable for flow conditions up to and including the 100-year frequency flood. Erosion control and re-establishment of an appropriate vegetative cover in the reservoir bed are also items which are necessary and are usually based on the conditions at the site and the final configuration of the area. For some low head run-of-the-river concrete dams for which there is significant continual flow in the river and an accumulation of sediment upstream of the dam, the creation of sediment basins downstream of the breached dam where the sediment will be removed on a regular basis may be necessary to limit the movement of sediment further downstream.

B. INVESTIGATIONS AND EVALUATIONS FOR ABANDONMENT OF DAMS

Upon the end of the useful life of a disposal impoundment it is often necessary for the owner of such a structure to reclaim and abandon it. This reclamation and abandonment is most frequently associated with slurry disposal at mining operations, reservoir sediment disposal at lake or river dredging operations, and ash disposal at power plants. Often this process is assumed by the owner to remove the associated dam structure from the dam safety regulatory jurisdiction. This assumption is usually based on the belief that the hardened surface of the impounded refuse material is characteristic of the entire volume of impounded material. However, studies have indicated that while this material may solidify on the surface after a period of time, a portion of the material below the surface remains fluid for an extended period of time. Thus, if the dam were to fail, the remaining fluid material could escape, possibly causing loss of life and/or significant property damage. Therefore, dams used in conjunction with disposal operations cannot be removed from Illinois dam safety regulation until it has been verified that the existing impounded material is not flowable and appropriate measures have been taken to prevent it from becoming flowable by recharging or seismic activity.

The following guidelines have been written in an attempt to provide general information regarding the methods of testing, analyses and computations which must be completed and submitted with an application for permit to support an owner's request for abandonment of a disposal impoundment dam.

An evaluation regarding a request to permit abandonment of a disposal impoundment structure will be based on the documentation and data addressing four issues: 1) the classification of the existing condition of the impounded material with respect to its fluid nature; 2) the liquefaction potential of the impounded material and the related stability of the containing dam; 3) the final surface configuration for the impoundment including the potential for resaturation of the impounded material, especially from any surface water impounding characteristics and the erosion potential of the surface material; and 4) the establishment of a follow-up inspection schedule to ensure the proposed plans have been effective and the submittal of record drawings.

1. Existing Impounded Material

The existing material which has been impounded must be analyzed and classified with respect to its fluid nature. To establish the characteristics of the material, actual field samples must be obtained, tested and evaluated. Testing and analyses, as appropriate, should be completed to determine such parameters as liquid limit, water content, yield shear strength, permeability, viscosity, particle grain size distribution, confining pressure and void ratio of the material. Piezometers or other observational devices may also be used to assist in the evaluation and classification process.

If the existing impounded material is found to be of a non-fluid nature then the liquefaction potential must be evaluated as described in Section 2. If the liquefaction potential is found to be low, then a plan to prevent resaturation as discussed in Section 3 would need to be developed.

If the existing impounded material is found to be of a fluid nature and abandonment is desired then design of an appropriate method to dewater the material must be developed. Additionally, a plan to prevent future resaturation of the impounded material must also be completed. To ensure a continued non-fluid state is maintained it is suggested that observational devices such as piezometers be installed and monitored for a period of not less than one year after initial dewatering has been completed. Upon completion of dewatering procedures the existing impounded material must be evaluated with respect to liquefaction potential (as discussed in Section 2).

2. Liquefaction Potential

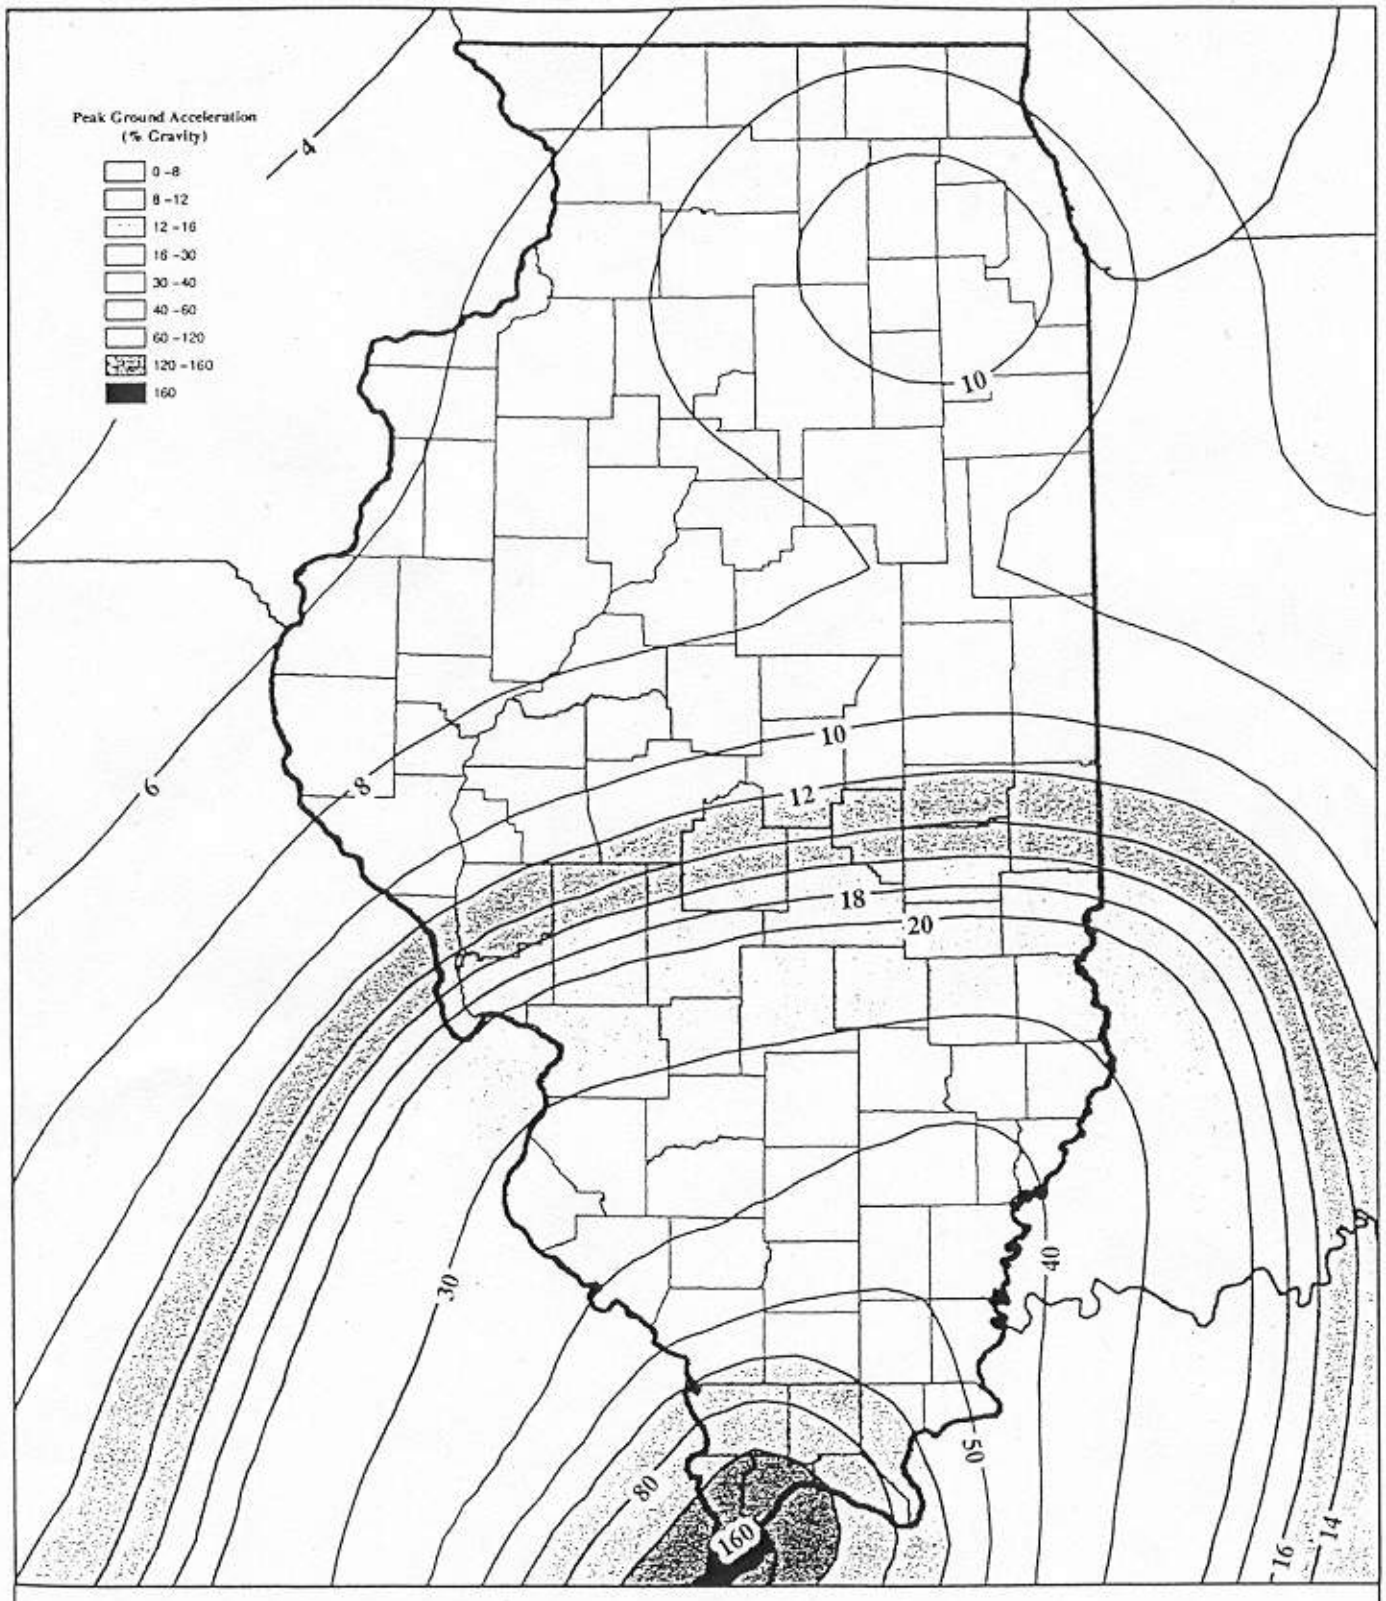
The impounded material within a disposal impoundment dam must be evaluated to determine if the material is susceptible to liquefaction. If necessary, a computer model capable of analyzing the dynamic effects should be used.

If the material is found to be susceptible to liquefaction then no abandonment would be permitted unless plans for modifications to eliminate the liquefaction potential were completed and approved.

If the material is not susceptible to liquefaction the abandonment procedures may be permitted providing that the issues of Sections 1, 3 and 4 have been appropriately addressed and the containing embankment

is shown (by submitting appropriate support documentation) to be stable under static conditions.

3. Resaturation Potential



To prevent resaturation, water should not be permitted to pond on the surface of the slurry material or any cover material. Elimination of any existing surface impoundment on the slurry material will be required. Plans to prevent any future surface water impounding capability and the prevention of erosion on the final surface material should be required.

4. Final Inspection and Record Drawings

A final inspection and report by a professional engineer must be completed and submitted to the Office of Water Resources one year after the completion of the abandonment modifications to the dam. This inspection will evaluate and report the effectiveness of the abandonment designs. Record drawings should be submitted along with the final inspection report.

SECTION 1

GENERAL

This operation and maintenance manual, (hereafter referred to as O&M manual), outlines objectives, proposed policies, responsibilities, and procedures for City of Wherever personnel who are responsible for the management of the Unknown Creek Dam.

REASONS FOR DEVELOPMENT AND DISSEMINATION OF THE O&M MANUAL

The Rivers, Lakes and Streams Act, (615 ILCS 5) Paragraph 23a includes the statement "The Department is authorized to carry out inspections of any dam within the State, and to establish standards and issue permits for the safe construction of new dams and the reconstruction, repair, operation and maintenance of all existing dams." (emphasis added).

Part 3702 of the 17 Illinois Administrative Code, Chapter I entitled the "Construction and Maintenance of Dams" details the requirements to obtain a permit for the construction, operation, and maintenance of a dam. Section 3702.40 b) includes the following statements:

> "4) An applicant for a Class I or II dam shall submit an operational plan specifying the method and schedule for the operation of the dam and the routine operating procedures to keep the dam in good working order, including an emergency warning plan.” and
>
> "5) As a condition of each permit, the dam owner shall submit a maintenance plan detailing the procedures and schedules to be followed to maintain the dam and its appurtenances in a reasonable state of repair."

Thus it is a requirement of all dam owners who have dams which fall under the jurisdiction of the Illinois Department of Natural Resources to operate and maintain them safely.

As a dam owner the City of Wherever is responsible for the safety of the public and for maintaining the structures within the City's jurisdiction for both safety and economy. The overall public interest is served by providing a document to serve as a basis for the safe and economical operation and maintenance of the dam during both emergency and day-to-day conditions.

GENERAL RESPONSIBILITIES CONCERNING DAMS

Specific information should be included either here or throughout the O&M plan. The following comments are noted for general guidance for development of the O&M plan.

City Council

The City Council should annually provide sufficient funding to safely maintain and operate the dam. The estimated annual funding requirements as of the date of this plan is $ _____. The City Council should also provide sufficient authority to personnel within city government to assure the performance of critical functions during emergencies.

Street Department

The Street Department may have specific responsibilities which should be outlined in the O&M plan. The responsibilities might include mowing of the dam; removal of debris from the spillways; placing needed rip rap; and providing trucks and other equipment, personnel, and material during emergency actions.

Water Department

The Water Department may have specific responsibilities which should be outlined in the O&M plan. The responsibilities might include the overall responsibility for the dam such as making emergency action decisions; inspecting the dam; operating and maintaining the dam's gates, valves, and electrical system; and providing equipment, personnel, and material during emergency actions.

Emergency Services and Disaster Agency

The city's Emergency Services and Disaster Agency should review, and revise if necessary, the Emergency Action Plan for the dam prior to the plan being submitted for permit approval. The Agency should be responsible to keep the information in the Emergency Action Plan for the dam current. It should coordinate with other agencies (local, county, state, federal) the responses to an emergency at the dam.

SECTION 2

DEFINITIONS

Abutment - That part of the valley side or concrete walls against which the dam is constructed. Right and left abutments are those on respective sides of an observer when viewed looking downstream. (Illustration 1 depicts the principal parts of a "typical" earthen dam and its appurtenant works.)

Appurtenant Works - The structures or machinery auxiliary to dams which are built to operate and maintain dams; such as outlet works, spillways, gates, valves, channels, etc.

Boil - A stream of water discharging from the ground surface downstream of the dam carrying with it a volume of soil which is distributed around the hole formed by the discharging water.

Berm - A horizontal step or bench in the sloping profile of an embankment dam.

Breach - A break, gap, or opening (failure) in a dam which releases impoundment water.

Concrete Block - An erosion protection method using interlocking concrete blocks, usually with openings that are filled with soil and grass.

Core - A zone of material of low permeability in an earthen dam.

Dam - A barrier built for impounding or diverting the flow of water.

Dike (Levee) - An embankment or structure built alongside a river to prevent high water from flooding bordering land.

Drain, Layer or Blanket - A layer of pervious material in a dam to facilitate the drainage of the embankment including such items as a toe drain, a weephole, and a chimney drain.

Drawdown - The resultant lowering of water surface level due to the controlled release of water from the impoundment.

Embankment - Fill material, usually earth or rock, placed with sloping sides.

Earthen Dam - Any dam constructed of excavated natural materials.

Emergency Action Plan - A predetermined plan of action to be taken to reduce the potential for property damage and loss of lives.

Failure - An incident resulting in the uncontrolled release of water from a dam.

Freeboard - The vertical distance between a stated water level and the top of a dam. (See Illustration 1.)

Gate or Valve - In general, a device in which a leaf or member is moved across the waterway to control or stop the flow.

Groin - The junction of the upstream or downstream face of the dam with the valley wall.

Maintenance - The upkeep, involving labor and materials, necessary for efficient operation of dams and their appurtenant works.

Operation - The administration, management, and performance needed to operate the dam and appurtenant works.

Operation and Maintenance Inspection - Inspections conducted by the dam operator. These inspections are frequent visual "walk-around" inspections of the dam surface and appurtenant works.

Outlet - An opening through which water can freely discharge for a particular purpose from an impoundment.

Phreatic Surface - The upper surface of saturation in an embankment.

Piping - The progressive development of internal erosion by seepage, appearing downstream as a hole or seam, discharging water that contains soil particles.

Riprap - A layer of large stones, broken rock or precast blocks placed in a random fashion usually on the upstream slope of an embankment dam, on a reservoir shore, or on the sides of a channel as a protection against current, wave and ice action.

Silt/Sediment - Soil particles and debris in an impoundment.

Slump/Slide Area - A portion of earth embankment which moves downslope, sometimes suddenly, often with cracks developing.

Spillway System - A structure or structures over or through which flows are discharged. If the flow is controlled by gates, it is considered a controlled spillway. If the elevation of the spillway crest is the only control of the flows, it is considered an uncontrolled spillway.

Emergency Spillway - A spillway designed to operate very infrequently, only during exceptionally large floods, usually constructed of materials expected to erode slowly.

Principal Spillway - The main spillway which controls both normal and flood flows and is constructed of non-erodible materials.

Auxiliary Spillway - A spillway which works in conjunction with the principal spillway to control flood flows and is constructed of non-erodible materials.

Stilling Basin - A basin constructed to dissipate the energy of fast flowing water, such as from a spillway, and to protect the stream bed from erosion.

Toe of Embankment - The junction of the face of the dam with the ground surface in the floodplain upstream or downstream of the dam.

Trash Rack - A structure of metal or concrete bars located in the waterway at an intake to prevent the entry of floating or submerged debris.

SECTION 3

INFORMATION ABOUT THE DAM

LOCATION

The Unknown Creek Dam is located in the southeast part of Wherever in the northwest part of Whichever County, Illinois. The dam is located on Unknown Creek in the southeast quarter of Section 4, Township 21 North, Range 9 East of the 4th Principal Meridian. Plate 1 shows the general vicinity of the dam within the State of Illinois, and Plate 2 is a location map.

DESCRIPTION OF DAM AND APPURTENANCES

The Unknown Creek Dam is an earth embankment structure approximately 31 feet high and 1480 feet long. The top of dam elevation is 740.8 and both faces of the dam slope at 3 horizontal to 1 vertical.

The appurtenant works consist of a 24 inch diameter concrete low flow pipe principal spillway, a reinforced concrete drop inlet auxiliary spillway with a dewatering gate, and an earth cut emergency spillway. The 24 inch diameter low flow pipe with a trash rack at its entrance and the drop inlet spillway both discharge through a 60 inch diameter concrete pipe into a reinforced concrete stilling basin at the downstream toe. The emergency spillway is located at the left abutment of the dam. (Left and right orientation is based on looking in the downstream direction.) The emergency spillway is a 150 foot wide earth cut with a concrete wall crest control section.

The principal and auxiliary spillway system is designed to pass the 100-year frequency storm with about 5.4 feet of freeboard, that is, without the emergency spillway functioning. The emergency spillway is designed to function for any storm event greater than the 100-year frequency storm. The combined spillway capacities are capable of passing 50 percent of the Probable Maximum Flood (PMF) with 2.9 feet of freeboard and 100 percent of the PMF with 1.3 feet of freeboard.

Plate 3 shows a plan view of the dam. Plate 4 shows a cross section of the dam embankment at the principal spillway. Plate 5 shows a profile of the dam.

SIZE CLASSIFICATION

With a maximum height of 31 feet and a maximum storage capacity of approximately 198 acre-feet, the dam is in the small size category.

HAZARD CLASSIFICATION

The Unknown Creek Dam is classified as a CLASS I, HIGH HAZARD POTENTIAL dam because of the high probability that, in the event of a dam failure, loss of life and/or property downstream of the dam would be substantial.

PURPOSE OF DAM

The dam serves to form a dry detention reservoir for the control of flooding on the Unknown Creek which flows through the southeastern part of Wherever.

PERTINENT DATA

Pertinent data about the dam, appurtenant works, and reservoir is presented in Table 1. Plates 3 through 5 show plans, sections and details of the dam and appurtenant works.

TABLE 1

SECTION 4

OPERATION ACTIVITIES

TYPES OF DAM INSPECTIONS

The inspection program includes two types of dam inspections. The first is regularly conducted by the Dam Operator and is referred to as an Operation and Maintenance Inspection. The second type of inspection, referred to as the Engineering Inspection, is conducted by a qualified engineering consulting firm approved by the City of Wherever, (all engineering inspection reports must be signed and sealed by an Illinois Registered Professional Engineer).

Operation and Maintenance Inspection:

Occasional "walk-around" inspections of the dam and appurtenant works are to be made by the Dam Operator. During these inspections, a checklist of items to be maintained and items to be observed should be recorded. Appendix A provides an example of the Operation and Maintenance Inspection Checklist to be utilized for these inspections. Illustration 2 identifies some potential problem indicators at a "typical" earthen dam.

Frequency: Monthly and during and after unusual events such as heavy rainfall or an earthquake.

Inspection Items: During each inspection the following items should be noted in particular:

(1) Water Level - A staff gage which can be easily seen when the reservoir is full should be installed or painted on the drop inlet. Maximum reservoir levels as a result of heavy rainfall should be recorded.

(2) Earth Embankment - Walk the crest, abutments, groins, side slopes, downstream toe and upstream toe or at the waterline of the dam concentrating on surface erosion, seepage, cracks, settlements, slumps, slides, and animal burrows. These are described as follows:

Surface Erosion - Removal of vegetative cover by water action or pedestrian or vehicle usage forming deep ruts or gullies.

Seepage - The passage of water through and/or underneath the earth embankment abutment and natural groundline or at the contact between the embankment and outlet works can be indicated by cattails or other wet environmental vegetation, erosion channelization, or slumping on the embankment face.

Cracks - Deep cracks usually indicate the movement of the dam and/or the foundation and can be in either the longitudinal (along the length of the dam) or transverse (across the dam) directions. Cracking can be an indicator of the beginning of slumps. Shallow cracks may develop during the summer when the surface soils of the embankment become severely dried and are usually of no concern in regard to the safety of the dam.

Settlement - Settlement is indicated by depressions or low spots and can be signs of consolidation of the dam or foundation or the loss of material beneath the settlement area.

Slumps/Slides - Slow or sudden movements of the earth embankment slope on either face toward the toe of the dam.

> If seepage indicates the presence of soil particles, or if deep cracks, settlement, slumps, or slides are noticed, a qualified engineer should be contacted immediately for consultation.

Animal Burrows - Animal burrows result in a loss of earth embankment material and can provide seepage paths for water through the embankment.

(3) Vegetation - Grass should be a thick vigorous growth to stabilize embankment soils and prevent erosion from occurring. Note the height of the grass; if greater than 1 foot, a mowing of the area should be scheduled before the next inspection. There should be NO trees on the earth embankment and NONE within a minimum of 20 feet of the embankment toes or concrete structures. There should be NO trees in the emergency spillway.

(4) Trash Racks - Check to make sure that the trash racks are unobstructed, operating well, and allowing for the free flow of water.

(5) Drop Inlet Spillway - Check for any debris or other obstructions around the inlet crest and at the bottom of the drop inlet which may block or restrict the free flow of water. Check for the development of any rusty areas on the concrete, and seepage, cracking, breaking, or spalling of the concrete. Check the vent pipes for overall condition and alignment and to ensure that the pipes are clear and unobstructed. (Do not place your hand or any tool near the inlet of the vent pipe if flows are passing over the crest of the auxiliary spillway as suction through the vent pipe may be occurring.)

(6) Outlet Works - Check for any debris or other obstructions within the impact basin which may block or restrict the free flow of water. Check for the development of any rusty areas on the concrete, and seepage, cracking, breaking, or spalling of the concrete. Check to make sure weepholes are clear and operating properly. Check for any erosion occurring at the embankment/structure junction.

(7) Concrete Block and Rip Rap - Check to make sure that the blocks and rip rap are remaining in a uniform position. Freeze/thaw action or flow over the blocks or rip rap may tend to lift or fracture them, thus requiring replacement or leveling to maintain the necessary level of protection. NO trees or woody vegetation should be growing through the blocks or rip rap.

(8) Mechanical Equipment - Check for any debris or other obstructions around the dewatering gate which may block or restrict the free flow of water. Operate the gate from the fully closed to the fully open position taking note of the physical and operating conditions of the system. Lubricate the stem, stem guides, wedges and hoisting mechanism a minimum of two (2) times a year. NOTE: Except in emergencies, the drawdown of water using the dewatering gate should be limited to 0.5 foot per day to

minimize upstream slope stability problems. (Refer to Appendix D for operation and maintenance of the sluice gate.)

(9) Fences - Check for damage, accumulated debris, operation of gates and locks, and adequacy of locations (this may change with time as people access the area or development occurs in the area).

(10) Drains - The change in location or amount of flows discharging from the toe drain should be recorded. If a significant change has occurred, a qualified engineer should be contacted for consultation.

(11) Emergency Spillway - Check for settlement or cracking of the crest control wall. Check for any logs, tree or brush growth, and other debris in the spillway, upstream and downstream areas which may restrict the flow of water.

(12) Downstream Floodplain - Check the floodplain downstream of the dam for a distance of at least 100 feet for signs of seepage or boils.

Records: A log book of activities occurring at the dam is to be kept current by the Dam Operator. The log book should be reviewed during the Engineering Inspection and may be helpful during budget preparations. This book should contain at least the following documentation:

(1) Completed operation and maintenance inspection checklists
(2) Additional visual observations
(3) A list of maintenance performed
(4) A list of any unusual occurrences at the dam
(5) A copy of the engineering inspection reports

Engineering Inspection:

The engineering inspection is to be conducted by a qualified engineering consulting firm approved by the City of Wherever. The inspection will provide a thorough evaluation of the condition of the dam and appurtenances. Appendix B is an example of the inspection report form which is to be utilized for these inspections.

Frequency: The Unknown Creek Dam is classified as a CLASS I, HIGH HAZARD POTENTIAL dam. Class I dams are to be inspected annually.

Inspection Items: The engineer will thoroughly inspect the items noted under Operation and Maintenance Inspection in addition to the following items:

(1) Principal and Auxiliary Spillways - Check for signs of seepage, structural cracking or spalling of concrete, misalignment of pipe, joint separation or differential settlement.

(2) Emergency Spillway - Check for signs of structural cracking or spalling of the concrete crest control wall. Check for signs of degradation of the embankment on the right of the emergency spillway to assure that emergency spillway flows do not attack the left downstream dam groin.

Records: The Dam Inspection Report form, Appendix B, will be completed by the inspecting engineer and will be signed and sealed by an Illinois Registered Professional Engineer. This report will document problem areas and deficiencies; recommend remedial actions for problem areas; and establish time requirements for dealing with the problems. The original report will be retained in the City of Wherever's Unknown Creek Dam file and a copy of the report will be submitted to the Illinois Department of Natural Resources, Office of Water Resources.

REVIEW OF EMERGENCY ACTION PLAN

The emergency action plan should be reviewed annually to assure that all contacts, addresses, telephone numbers, etc. are current. Changes to the plan should be made as appropriate but only with the concurrence of the Wherever office of the Emergency Services and Disaster Agency and of the Department of Natural Resources, Office of Water Resources. Copies of any revisions should also be forwarded to all personnel that have the plan.

SECTION 5

MAINTENANCE ACTIVITIES

Timely repairs are a must after problem areas have been identified. The dam operator is to perform the work required to correct items noted in the operation and maintenance and engineering inspections. Such items include mowing, seeding, tree and brush removal, painting, greasing, replacing riprap, repairing fences and locks, clearing debris, etc. Common maintenance items are pictured in Illustration 2. The maintenance activities specified in the following sections are minimum requirements. NOTE: NO alterations or repairs to structural elements should be made without the assistance of a qualified engineer and the concurrence of the Illinois Department of Natural Resources, Office of Water Resources.

Debris: Remove all trash, logs and other debris which may obstruct flow into the principal spillway pipe, drop inlet, and emergency spillway or block passage from their discharge channels.

Concrete Block and Rip Rap: Replace or level blocks and rip rap as needed to provide adequate protection against erosion.

Vegetation Control:

(1) A good grass cover on the embankment should be maintained by seeding, fertilizing and mulching areas which are refilled, barren, or thinly vegetated. Seeding mixtures used for maintenance reseeding shall result in a cover compatible with adjacent cover. The seeding mixture used at the time of the dam's construction was _____ .

(2) Grassed areas such as the embankment, the emergency spillway, and areas beyond the embankment toes for a distance of at least 20 feet should be mowed at least twice annually and at any time the height of the grass exceeds 1 foot.

(3) All eroded areas should be filled and compacted, reseeded, fertilized and mulched to establish a thick erosion resistant cover.

(4) All trees and brush on the dam embankment should be removed to prevent development of a root system which could provide seepage paths. Herbicides utilized for tree and brush control are discussed in Appendix C.

(5) The emergency spillway area should be kept clear of weeds, brush and trees.

(6) All trees and brush should be removed from the outlet channel to a distance of approximately 100 feet downstream from the stilling basin.

(7) All brush and trees should be removed to a distance of approximately 20 feet beyond both toes of the dam.

Animal Damage: Rodent holes should be filled with compacted clayey dirt and reseeded. If rodents become a nuisance, an effective rodent control program as approved by the Illinois Department of Natural Resources District Wildlife Biologist should be implemented.

Concrete: Spalled and cracked areas on concrete structures should be patched to guard against any further deterioration of the structure. Concrete construction joints should be filled with a suitable joint filler such as a bituminous sealant to protect against weathering.

Drains: All drains and weepholes should be kept open and functional by cleaning them of silt and debris.

Painting: All metal work, fencing, railing, etc. should be properly prepared and repainted as necessary to protect against rusting.

Signs: All warning signs and staff gages should be maintained (repaired, painted, or replaced) as needed.

Vent Pipes: All obstructions should be cleared from the vent pipes.

Sedimentation: Sedimentation of this reservoir is estimated to occur at the rate of approximately 1 ac-ft per year, which is about 1.1% of the initial reservoir storage at the crest of the drop inlet. As sediment accumulates in the reservoir less storage is available for the control of flood waters from the watershed. Efforts should be made to work with the U.S. Department of Agriculture, Natural Resources Conservation Service and the upstream land owners to minimize the sediment being transported to the reservoir. A location for the placement of the sediment removed from the reservoir (if upstream of the dam, above the top of the dam) should be determined.

Mechanical Equipment: The hoisting mechanism, stem and guides, wedges, nuts and bolts should be cleaned and lubricated at least two (2) times per year. (Refer to Appendix D for operation and maintenance of the sluice gate.)

APPENDIX B

ENGINEERING INSPECTION FORM

(See OWR document entitled “Guidelines and Forms for Inspection of Illinois Dams”)

APPENDIX C

HERBICIDES

HERBICIDES

Site personnel should check with the Illinois Department of Natural Resources, Regional Fisheries Biologist and the Regional Wildlife Biologist before using any herbicide. Read the product label prior to use and follow the use directions and precautions accordingly.

On March 1, 1979 the U.S. Environmental Protection Agency (U.S.E.P.A.) halted the use of the herbicide 2, 4, 5-T in parks and recreation areas. The use of silvex (2, 4, 5-TP) around water has also been banned.

The Agronomy Department at the University of Illinois and the Aquatic Biology Section of the Department of Natural Resources, Office of Scientific Research and Analysis indicate that the herbicides containing the 2, 4-D or 2, 4-DP are legal for use in parks and recreation areas and effective for controlling brush and woody growth. Some examples of approved herbicides are:

1) Tordon RTU by DOW Chemical. (Can be obtained with blue dye.)

2) WEEDONE 170 by Union Carbide

3) WEEDONE, 2, 4-DP by Union Carbide

4) A 1% to 2% solution of ROUNDUP

5) Garlon by DOW Chemical

6) Banvel by Sandoz

Your distributor may carry brand name herbicides other than those listed above. Be certain that the product <u>does not</u> contain the ingredients 2, 4, 5-T or 2, 4, 5-TP. An example of an <u>unacceptable</u> product is ESTERON 2, 4, 5 by DOW Chemical.

APPENDIX D

OPERATION AND MAINTENANCE OF SLUICE GATE

MAINTENANCE

The maintenance on a sluice gate is minimal but very important. The gate, itself, requires no periodic maintenance or lubrication. It is critical that the operating stems be periodically cleaned and greased. Manufacturers recommend that stems be cleaned and greased at least once every six months. Dirty grease or lack of grease will increase the operating force necessary to open or close the gate and will accelerate the wear in the stem nut. Manufacturers of sluice gates recommend the following lubricants for this use:

Lubriplate Lithium Base No. 630AA or AAA
Texaco Multi-Fax Heavy Duty No. 2
Conoco All Purpose Superlube
Shell Alvania No. 1 or No. 2 EP
Mobilox Grease No. 2 EP
Valvoline Val-Lith No. 2 EP

At least once a year, all grease fittings on manual floor stands should be lubricated with a small amount of heavy duty grease designed to remain pliable and not dry out over long periods and wide temperature ranges. For best results the floor stand should be greased when being operated. For the first three or four turns of the crank, grease should be applied to each fitting after each turn. This will insure adequate lubrication of all parts. Over lubrication is not possible. Manufacturers recommend the following lubricants for this application:

Mobilgrease Special
Mobilplex No. 45

The exposed non-operating surfaces of the gate, stem guides, and hoisting mechanism should be cleaned and painted as conditions require or permit. All machined corrosion-resistant metal faces must be thoroughly protected during the cleaning and painting.

OPERATION

There isn’t a sluice gate manufacturer who will guarantee a leak-proof gate. AWWA Specifications maintain that leakage for a seating head gate should not exceed 0.1 gpm per foot of perimeter. For unseating head gates with heads of up to 20 ft., the specifications indicate that leakage should not exceed 0.2 gpm per foot of perimeter.

As an example: a 24-inch diameter circular opening gate would have a circumference of 6.25 ft. If an unseating head gate operates under a head of 20 ft. the allowable leakage would be 1.26 gpm. That is, the gate could pass 1.26 gpm without requiring adjustment. When there is excessive leakage through the gate seating surfaces, the wedges should be re-adjusted per the manufacturer's instructions. These adjustments should not be attempted without adequate instruction, help, tools, replacement parts, and safety equipment.

Sluice gates are designed and constructed to operate satisfactorily under the design operating conditions. Care should be taken in the operation of the gate to assure that the design operating conditions are not exceeded. If, in the operation of the gate, an obstruction is met, either in the opening or closing direction, the obstruction must be removed, before continuing the operation of the gate. Excessive force must never be placed on the gate or gate stem by the operator in an effort to move the gate further. Manual operators are designed so that the maximum pull on the crank need not exceed 40 pounds when the gates are opened or closed against the specified operating head. If a problem arises in the operation of the gate, the operator should consult the Superintendent and a determination will be make as to the corrective action to be taken.

Prior to opening a sluice gate, the following checklist activities should be performed:

(1) Gate, wedges, stem, stem guides and hoist mechanism inspected.

(2) All sand, stones, and other debris cleaned from the top of the gate, wedges, and stem guides.

(3) Stem and stem guides cleaned and lubricated.

(4) Guides cleaned and lubricated.

(5) Hoisting mechanism lubricated.

When operating the gate, record the number of turns of the crank to open the gate. Repeat the number of turns to close the gate. After closure, check the gate for leakage. If leakage is "excessive" or greater than prior to opening, the wedges may need adjusting. <u>Do not force the crank to attempt to close the gate.</u> If any problems are encountered, the Superintendent should be notified immediately.

EMERGENCY ACTION PLAN
UNKNOWN CREEK DAM

(The information that follows identifies the procedures to be followed in the event of a heavy rainfall or a dam failure. An example of a complete plan is specifically not included. OWR and the Illinois Emergency Management Agency offer a course on the preparation of emergency action plans for dams. Guidance on the development of a plan can be obtained in the document entitled "Federal Guidelines for Dam Safety: Emergency Action Planning for Dam Owners," prepared by the Interagency Committee on Dam Safety and the Federal Emergency Management Agency (FEMA-64). The plan should be coordinated with emergency services personnel prior to submittal to OWR for permitting of the dam construction. Some of the items which relate to actions to be taken at the dam are included for consideration and guidance.)

EMERGENCY DETECTION, EVALUATION AND ACTIONS

The following section explains some of the problems which may occur at a dam, how to make a rapid evaluation of the problem, and what action should be taken in response to the problem. This section presents only generalized information for the dam operator to aid in a first response to a problem. Any suspected problem should be reported and assistance from a qualified engineer should be obtained as soon as possible.

This section will be placed in the following format:

PROBLEM
- INDICATOR
  - HOW TO EVALUATE PROBLEM
    - ACTION TO BE TAKEN

SEEPAGE

Wet area, on downstream embankment slope or any other area downstream of the embankment, with very little or no surface water or very minor seeps.

- This condition may be caused by infiltration of rain water which is not serious, or may be the start of a serious seepage problem which would be indicated by a quick change to one of the conditions below.
  - No immediate action required; note location for future comparison.

Same wet area as above with moderate seeps of clear or relatively clear water and rate of flow not increasing.

- Measure the flow periodically and note any changes in clarity.

No immediate action required; note location, flow rate, and clarity for future comparison. During reservoir flood stages the seepage area should be watched for any changes.

Same wet area as above with moderate seeps of clear or relatively clear water and rate of flow increasing.

Measure the flow periodically and note any changes in clarity. Inspect the downstream area for any new seeps.

Contact a qualified engineer for an immediate inspection. Observe the condition constantly for any further changes in flow rate or clarity unless notified otherwise by the engineer.

Piping (seepage with the removal of material from the foundation or the embankment) with moderate to active flows of cloudy to muddy water.

If the water is cloudy to muddy and the rate of flow is increasing, this condition could lead to failure of the dam.

Immediate action is necessary. Open the dewatering gate completely. If no whirlpool is noted on the upstream side of the dam, place an "Inverted Filter" over the seepage area on the downstream side of the dam (see Plate 6). The filter should consist of a 3 to 5 ft. thick blanket of material graded from coarse sand and pea gravel at the bottom to 3-inch stone at the top. If needed, use larger stones on the top of the filter. Use filter cloth at the bottom of the filter if available. Do not try to "plug" or stop the flow of water from this location. Try to reduce the movement of material using this filter while allowing the flow to pass through it. Notify the Emergency Services and Disaster Agency Office for evacuation of the dam breach area, (see Plates 1-5).

If, along with the piping, there is an upstream swirl (whirlpool) caused by water entering through the abutments of embankment, failure may be imminent.

Notify the Emergency Services and Disaster Agency Office for evacuation of the dam breach area, (see Plates 1-5), open the dewatering gate completely, and attempt to construct the inverted filter over the seepage area on the downstream side of the dam as noted above. The thickness of the section will generally be greater than 5 ft. Plugging of the upstream entrance of the "pipe" should also be attempted using large rock or anything else that is available (rolls of fencing, bed springs, cars, large hay bales, etc.). If the large material placed in the hole appears to have reduced the

flow, follow with progressively smaller material in an attempt to seal the entrance.

Boils (soil particles deposited around a water exit forming a cone, varying from a few inches in diameter spaced 2 to 3 ft. apart to isolated locations several feet in diameter in the floodplain downstream of the dam) may show the same types of flow as noted above.

Evaluation of the problem is the same as noted above for the various flow conditions, i.e., clear and constant, clear and increasing, and cloudy or muddy and increasing.

Actions to be taken are essentially the same as those noted above. An additional method to try to control the movement of material from a boil is the construction of a boil ring or ring dike. An example of a boil ring is shown in Plate 7. In placing the ring it must be remembered that the work is not being done to stop the flow of water but rather to stop the movement of material. When the ring reaches an elevation where the water that is discharging from the ring is flowing clear the work should stop and the flows monitored for changes.

RESERVOIR WHIRLPOOL

Water flowing in a swirling motion in an area on the upstream side of the dam.

During high reservoir stages when the drop inlet is completely submerged, debris may come together above the drop inlet and due to flows at the inlet move in a rotating motion. If there is no evident downstream exit of "piping" as noted above and the rotating debris is over the drop inlet, then it can be assumed that there is no piping failure. If the whirlpool is over a section of the embankment or abutment, the situation is critical and failure of the dam may be imminent.

Notify the Emergency Services and Disaster Agency Office for evacuation of the dam breach area, (see Plates 1-5). Take the actions noted above under "piping".

SLIDE

Movement of a portion of the embankment, either the upstream or downstream slope, toward the toe of the dam.

Various degrees of severity of a slide require different responses. The first condition is that the slide does not pass through the crest and does not extend into the embankment more than 5 ft., measured perpendicular to the slope.

For this condition, a qualified engineer should be consulted before any repairs are initiated to determine the cause of the slide and to recommend any modifications to prevent future slides. The downstream side of the dam should be watched for the emergence of any water either through the slide or opposite the slide. If discharging water is noted, the area the slide should be treated as a seepage location and monitored as noted above.

The second condition is that the slide passes through the crest and that the reservoir elevation is more than 10 ft. below the lowered crest.

Use the same actions as noted above and notify the Emergency Services and Disaster Agency of the situation so they may be prepared to act if the condition worsens.

The third condition is that the slide passes through the crest and the reservoir elevation is less than 10 ft. below the lowered crest.

This condition is critical and failure of the dam should be considered imminent. Notify the Emergency Services and Disaster Agency Office for evacuation of the dam breach area, (see Plates 1-5). Armor the crest of the lowered portion of the embankment and try to restore the lost freeboard. If seepage is also occurring, take the appropriate actions as noted above.

CRACKS

Cracks in the embankment can occur either in the longitudinal (along the length of the dam) or transverse (across the dam from upstream to downstream) direction.

Some cracking of the surface soils may occur when they become dry. This cracking is to be expected and no further action is required.

Longitudinal cracking can indicate the beginning of a slide or be an uneven settlement of the embankment.

Monitor the crack for future changes and contact a qualified engineer for assistance in the evaluation of the crack and recommended repairs.

Transverse cracking can indicate uneven settlement or the loss of support below the crack. Such cracks usually occur over an outlet conduit, near the abutments, or in the taller portion of the embankment.

If the crack does not extend completely across the dam and the reservoir elevation is more than 10 feet below the base of the crack, monitor the crack for future changes and contact a qualified engineer for assistance in the evaluation of the

crack and recommended repairs. If the crack extends across the dam and the reservoir level is less than 10 feet below the base of the crack, both the upstream and downstream sides of the dam should be protected with a plug and inverted filter (as noted above under seepage) and the Emergency Services and Disaster Agency should be notified of the situation so they may be prepared to act if the condition worsens.

BURROW HOLES

Holes in the embankment, varying in size from about 1 inch to 1 foot in diameter, caused by animals.

If the holes do not extend through the embankment the situation is usually not serious. Some animal holes will have soil pushed out around the hole in a circular fashion which may look like a boil (crayfish or crawdad). Watch for the movement of water and soil particles from these holes to determine whether they are boils.

Backfill as deeply as possible with impervious material. If rodents become a nuisance, an effective rodent control program, as approved by the Illinois Department of Natural Resources District Wildlife Biologist, should be implemented.

RESPONSIBILITIES

[This section should clearly specify responsibilities that are specific to this dam. General guidance for the positions noted for the City of Wherever are included but should be revised as appropriate for the dam and owner.]

PREPAREDNESS

Visual inspections of the dam and its appurtenances will be made on a routine basis per the schedule noted below. Items that will be monitored are those noted for the operation and maintenance inspection and are noted here again. The O&M inspection checklist should be completed for each inspection.

Inspection Items: During each inspection the following items should be noted in particular:

(1) Water Level - A staff gage which can be easily seen when the reservoir is full should be installed or painted on the drop inlet.

Maximum reservoir levels as a result of heavy rainfall should be recorded.

(2) Earth Embankment - Walk the crest, abutments, groins, side slopes, downstream toe and upstream toe or at the waterline of the dam concentrating on surface erosion, seepage, cracks, settlements, slumps, slides, and animal burrows. These are described as follows:

Surface Erosion - Removal of vegetative cover by water action or pedestrian or vehicle usage forming deep ruts or gullies.

Seepage - The passage of water through and/or underneath the earth embankment abutment and natural groundline or at the contact between the embankment and outlet works can be indicated by cattails or other wet environmental vegetation, erosion channelization, or slumping on the embankment face.

Cracks - Deep cracks usually indicate the movement of the dam and/or the foundation and can be in either the longitudinal (along the length of the dam) or transverse (across the dam) directions. Cracking can be an indicator of the beginning of slumps. Shallow cracks may develop during the summer when the surface soils of the embankment become severely dried and are usually of no concern in regard to the safety of the dam.

Settlement - Settlement is indicated by depressions or low spots and can be signs of consolidation of the dam or foundation or the loss of material beneath the settlement area.

Slumps/Slides - Slow or sudden movements of the earth embankment slope on either face toward the toe of the dam.

> If seepage indicates the presence of soil particles, or if deep cracks, settlement, slumps, or slides are noticed, a qualified engineer should be contacted immediately for consultation.

Animal Burrows - Animal burrows result in a loss of earth embankment material and can provide seepage paths for water through the embankment.

(3) Vegetation - Grass should be a thick vigorous growth to stabilize embankment soils and prevent erosion from occurring. Note the height of the grass, if greater than 1 foot, a mowing of the area should be scheduled before the next inspection. There should be NO trees on the earth embankment and NONE within a minimum of 20 feet of the embankment toes or concrete structures. There should be NO trees in the emergency spillway.

(4) Trash Racks - Check to make sure that the trash racks are unobstructed, operating well and allowing for the free flow of water.

(5) Drop Inlet Spillway - Check for any debris or other obstructions around the inlet crest and at the bottom of the drop inlet which may block or restrict the free flow of water. Check for the development of any rusty areas on the concrete and seepage, cracking, breaking, or spalling of the concrete. Check the vent pipes for overall condition and alignment and to ensure that the pipes are clear and unobstructed. (Do not place your hand or any tool near the inlet of the vent pipe if flows are passing over the crest of the auxiliary spillway as suction through the vent pipe may be occurring.)

(6) Outlet Works - Check for any debris or other obstructions within the impact basin which may block or restrict the free flow of water. Check for the development of any rusty areas on the concrete and seepage, cracking, breaking, or spalling of the concrete. Check to make sure weepholes are clear and operating properly. Check for any erosion occurring at the embankment/structure junction.

(7) Concrete Block and Rip Rap - Check to make sure that the blocks and rip rap are remaining in a uniform position. Freeze/thaw action or flow over the blocks or rip rap may tend to lift or fracture them, thus requiring replacement or leveling to maintain the necessary level of protection. NO trees or woody vegetation should be growing through the blocks or rip rap.

(8) Mechanical Equipment - Check for any debris or other obstructions around the dewatering gate which may block or restrict the free flow of water. Operate the gate from the fully closed to the fully open position taking note of the physical and operating conditions of the system. Lubricate the stem, stem guides, wedges and hoisting mechanism a minimum of two (2) times a year. NOTE: Except in emergencies, the drawdown of water using the dewatering gate should be limited to 0.5 foot per day to minimize upstream slope stability problems. (Refer to Appendix D for operation and maintenance of the sluice gate.)

(9) Fences - Check for damage, accumulated debris, operation of gates and locks, and adequacy of locations (this may change with time as people access the area or development occurs in the area).

(10) Drains - The change in location or amount of flows discharging from the toe drain should be recorded. If a significant change has occurred, a qualified engineer should be contacted for consultation.

(11) Emergency Spillway - Check for settlement or cracking of the crest control wall. Check for any logs, tree or brush growth, and other debris in the spillway, upstream and downstream areas which may restrict the flow of water.

(12) Downstream Floodplain - Check the floodplain downstream of the dam for a distance of at least 100 feet for signs of seepage or boils.

Areas downstream of the dam may experience flooding due to local runoff at times when the reservoir water level is low. However, high reservoir levels are an indicator of potential downstream flooding and are used in this plan to provide steps for various actions to be taken. The following schedule of inspections and evacuation procedures will be followed:

(1) Normal Conditions Surveillance

Under normal water level elevations (up to elevation 732.0) the embankment and appurtenant structures will be observed by the dam operator on a monthly basis.

(2) "Unusual" Storm Conditions

During and immediately following unusual storm and flood events (reservoir level equal to or greater than elevation 732.0) the dam operator will make visual inspections of the dam and its appurtenances at a minimum of every hour if it is currently raining and every 12 hours if it is not raining. Flooding in some areas downstream of the dam may occur for heavy rainfall events occurring in a short period of time. As reservoir levels increase above this elevation larger areas of flooding downstream of the dam may occur.

The dam operator is responsible to notify the Emergency Services and Disaster Agency (ESDA) in Wherever when the reservoir levels exceed elevation 732.0. The ESDA office will be responsible for notifying individuals and coordinating their evacuation and return in the event an emergency occurs.

If the reservoir level reaches elevation 734.0, the dam and appurtenances will be inspected at 1-hour intervals if it is currently raining and at 8-hour intervals if it is not raining.

If the reservoir level reaches elevation 735.5 and it is currently raining, the dam operator is responsible to notify ESDA. The dam and appurtenances will be inspected continuously if it is currently raining and at 4-hour intervals when the rain has stopped.

If the reservoir level reaches elevation 736.0 and it is currently raining, the dam operator is responsible to notify ESDA. The dam and appurtenances will be inspected continuously until the reservoir level falls to elevation 735.0 and the rain has stopped.

When the reservoir level reaches elevation 736.5 and it is currently raining, the dam operator is responsible to notify ESDA to evacuate all residents within the dam breach wave area (see Plates 1-5). The dam and appurtenances will be inspected continuously until the reservoir level falls to elevation 735.0 and the rain has stopped.

ESDA will not allow residents to return to the flood wave area until: 1) the lake level is below elevation 735.0, 2) the dam and appurtenances have been inspected by an engineer to determine if damage has occurred, and 3) all damages indicating a weakened condition of the dam have been remedied.

If there is no inflow to the reservoir the estimated time for the reservoir level to drop from the crest of the emergency spillway

(735.5) to the crest of the drop inlet (733.5) is 4.5 hours. With no inflow, the estimated time for the reservoir level to drop from the crest of the drop inlet (733.5) to the flow line of the low flow pipe (714.0) is 20 hours. If the low flow pipe or drop inlet are not allowing the reservoir level to drop due to debris accumulation or damage, the dewatering gate should be opened or portable pumps should be used to lower the reservoir level. The lower reservoir level will allow for the removal of debris, the repair of damage, and the re-establishment of storage in the reservoir.

EQUIPMENT AND MATERIALS LOCATIONS

The following equipment and materials are available at these sites:

Backhoe

GENERAL GUIDELINES FOR NEW DAMS AND IMPROVEMENTS TO EXISTING DAMS IN INDIANA

2001 Edition

Department of Natural Resources
Division of Water
Indianapolis, Indiana

2010 Appendix A, Appendix B Revisions included

GENERAL GUIDELINES FOR NEW DAMS AND IMPROVEMENTS TO EXISTING DAMS IN INDIANA

2001 Edition

Department of Natural Resources
Division of Water
Indianapolis, Indiana

2010 Appendix A, Appendix B Revisions included

PREFACE – January 1, 2001

These guidelines are directed to project engineers, technical professionals and owners involved in the design and construction of a proposed dam or the modification of an existing dam that is under the jurisdiction of the Indiana Department of Natural Resources (IDNR). The intent of these guidelines is to provide direction to experienced dam design professionals so that the final product, the dam, is safe and the owner's investment in professional engineering is maximized.

The majority of information given in this document is general and provides many of the dam safety technical principles used throughout the country. The Project Engineer in charge of the design of a dam must be a registered professional engineer and have the training and experience to properly apply these guidelines to the specifics of the site and the needs of the owner. If the owner's Project Engineer follows these guidelines and an appropriate engineering design package is submitted to Indiana DNR's Division of Water, the time to obtain approval on the proposed work will be significantly reduced.

These guidelines were modeled after Georgia's Safe Dam Program Engineering Guidelines, 1998 edition. Special thanks are extended to Georgia's Dam Safety personnel and the private engineering community practicing in Georgia for the special opportunity to utilize much of their work in these guidelines.

A committee of 17 professionals from the private engineering community and IDNR contributed significant time to the development of these guidelines. These individuals are listed below:

Siavash Beik	George Crosby	Richard Rampone
Soliman Sherkawi	Jon Stolz	Jack Winters
Ed Board	Scott Ludlow	Chris Ritz
Kenneth Smith	Dave Warder	Dennis Zebell
George Bowman	Christopher Murphy	Jim Sell
Mellissa Stefanovich	Bob Wilkinson	

Special thanks to Debbie Michaels for keying in the text, making revisions to draft copies of this document, and for making copies for distribution, and to Lenny Noens, Herb Bollinger, and Dave Knipe, the north, central, and south engineering basin managers, respectively, for their assistance with the final draft of the hydrology and hydraulics section.

The Federal Emergency Management Agency (FEMA) provided partial funding for the project and the Association of State Dam Safety Officials (ASDSO) encouraged the Division of Water to publish these guidelines. The backing of these two organizations in this project and their long-term support of dam safety efforts in Indiana are appreciated.

Dr. Brian J. Swenty, P.E., Associate Professor and Chair, Mechanical and Civil Engineering Department, University of Evansville, Evansville, Indiana edited the guidelines.

PREFACE – February 1, 2010

Revisions to the guidelines were made in February 2010 to provide clarification in the development of emergency action plans and to properly define hazard class. The definition of hazard classification was developed and defined in regulation and reference to an adapted table is not warranted.
To provide this clarity and new definition,

Appendix A - Table 3 was removed and replaced with the context of the enacted regulation that defines hazard class.

Also, Appendix B – The original "Outline of an Emergency Action Plan" was removed and replaced with a cover sheet that directs the reader to the "Indiana Dam Safety Inspection Manual – Updated 2007" version and Part 4 of that manual. The new Part 4 is entitled "Emergency Preparedness" and represents the recommended guidance for preparation of an Emergency Action Plan (EAP). Templates for an EAP are included in the "Updated 2007 Indiana Dam Safety Inspection Manual".

Table of Contents

TABLE OF CONTENTS

SECTION	TOPIC	PAGE
Section 1	OVERVIEW	1.1
Section 2	FIELD SURVEY	2.1
Section 3	GEOLOGICAL AND GEOTECHNICAL CONSIDERATIONS	3.1
Section 4	HYDROLOGY AND HYDRAULICS	4.1
Section 5	PLANS AND SPECIFICATIONS	5.1
Section 6	CONSTRUCTION MONITORING	6.1
Appendix A	HAZARD CLASSIFICATION	A.1
Appendix B	EMERGENCY ACTION PLAN - OUTLINE OF AN EMERGENCY ACTION PLAN - INSPECTION CHECKLIST	B.1
Appendix C	GEOTECHNICAL ADDENDUM - IN-SITU/FIELD TESTING - INSTRUMENTATION	C.1
Appendix D	RAINFALL DISTRIBUTION & PROBABLE MAXIMUM PRECIPITATION	D.1
Appendix E	SELECTED PLAN SHEETS FOR ILLUSTRATIVE PURPOSES & PARTIAL LIST OF SPECIFICATION ITEMS FOR SAMPLE DAM	E.1
Appendix F	COMMON PITFALLS	F.1
Appendix G	SPECIAL CONSTRUCTION MONITORING REPORTS	G.1
Appendix H	CORRECTION FORM	H.1

Overview

Section 1
OVERVIEW

The general guidelines contained in this manual are useful for the design of small to medium sized dams with the following typical characteristics:

- An earth embankment with appurtenant works constructed to remain stable under a variety of loading conditions for the design life of the structure.
- A properly sized principal spillway that will convey the runoff from normal rainfall events.
- An emergency spillway channel placed an adequate distance from the earth embankment that will operate infrequently and safely pass runoff from the design storm without overtopping the dam.

Guidance on analyses and design issues for innovative, untested, or high-risk dam designs is not covered in these guidelines. The extent of engineering tests, analyses, studies, evaluations, and assessments that are needed to justify an atypical design is beyond the scope of this manual. Further, the time to conduct the additional and extensive engineering analysis and review can be significant when compared to the typical dam described above.

Because each project requires site-specific considerations, these guidelines should not be viewed as a "cookbook" for the design, repair, modification or construction of a dam. The intent of this document is to outline the general technical data, engineering computations, and plans that need to be submitted with the permit application for the proposed work. If these guidelines are followed, the time necessary for the technical review and approval should be reduced. Questions concerning these guidelines should be addressed to the Division of Water at the Indiana Department of Natural Resources, 402 W. Washington Street, Indianapolis, Indiana, 46204.

Dams are complex structures that typically require a multidisciplinary analysis and design approach. Over the years, there have been many incomplete engineering submittals to the Department of Natural Resources (IDNR) that lacked adequate detail in a particular technical area (hydrologic/hydraulic, geotechnical, geological, surveying or structural). The analysis and design of a dam should be supervised by a Project Engineer who is a registered professional engineer. A complete engineering submittal requires adequate technical input and support from hydrologic, hydraulic, geotechnical, geological, structural, and mechanical engineers, as well as licensed land surveyors. It is important for the Project Engineer to consider archaeological and environmental issues in the design or modification of a dam.

An understanding of the roles of the various stakeholders is necessary for the design, construction, and operation of a safe dam.

1.1 Owner's Role

The storage of water is a hazardous activity; it creates increased risk to lives and property situated downstream of the dam. The owner of a dam is responsible for operating and maintaining the dam in a safe manner.

Under Indiana law, IC 14-27-7; "The owner of a dam ... and appurtenant works shall keep the structures and appurtenant works in the state of repair and operating condition required by the following":

- The exercise of prudence.
- Due regard for life or property.
- The application of sound and accepted engineering principles.

A property owner desiring to construct a dam should retain the services of a registered professional engineer experienced in the design and construction of dams and spillways. It is common practice for the owner and the engineer to discuss the owner's needs, the intended purpose of the dam, and the project budget before any design work is performed. During the design process, the owner remains in close contact with the engineer to periodically review the design and the desired project goals.

During construction, the owner works closely with both the engineer and the contractor. Unforeseen site conditions are frequently uncovered that require the owner to approve design changes. The Division of Water should be contacted before field changes are made to the approved plans.

After construction, an owner assumes the role as the primary caretaker of the project. Routine inspection and maintenance allows early detection of many problems that could occur with a dam. The owner should inspect the dam often, keep records of observations and measurements and learn as much as possible about the operation and maintenance of the dam.

Although a dam can be designed and constructed to be a safe structure, lack of routine maintenance and repair, or changing conditions, can eventually cause the dam to become unsafe. If a dam is not in compliance with State law, the owner will be required to improve the dam to bring it into compliance.

The owner may want to confer with an experienced attorney to assess the liabilities of owning a dam.

1.2 Role and Selection of a Project Engineer

The analysis and design of a dam should be supervised by a Project Engineer, who is a registered professional engineer with specialized expertise. These activities require an understanding of hydrology, hydraulics and the behavior of the materials used to construct and support the dam. The Project Engineer will likely need specialized technical input and

support from hydraulic, geotechnical, geological, structural, and mechanical engineers as well as licensed land surveyors.

The primary role of a Project Engineer is to provide leadership in the planning, design, and construction of a dam. A Project Engineer is responsible to see that all technical aspects of the dam and site have been completely evaluated. To accomplish this, the Project Engineer works closely with the owner to establish clear objectives and thoroughly evaluate the proposed dam site. A Project Engineer should have the experience necessary to combine the owner's objectives with the site's potential to develop a design for a safe dam. The Project Engineer supervises the preparation of the permit application, plans, specifications and engineering report, but the engineer's involvement does not end with the submittal to IDNR's Division of Water. It is vitally important that the Project Engineer be involved in the construction of the dam to assist the owner is resolving unforeseen problems at the site and ensure that the dam is constructed in accordance with the approved design. Once the dam has been constructed and the reservoir has filled, the Project Engineer should certify that the dam was constructed in accordance with the design plans and submit as-built drawings to the Division of Water.

Because the design of a dam requires a professional engineer who possesses unique abilities, it is preferable to select a Project Engineer based on qualifications rather than fee. While fee-based competition may result in lower initial design costs, lower costs are often associated with inexperienced engineers and frequently limit the engineer's ability to conduct detailed evaluations that are necessary to develop a cost effective and innovative design. Furthermore, a low design cost often results in a significant increase in the cost of construction as well as long term costs associated with operation and maintenance of the dam.

The Project Engineer should be selected on the basis of technical qualifications, experience with similar projects, reputation with other clients, and capability to meet the owner's time schedule. It is usually best to solicit qualification statements from a number of engineers and perhaps interview several of them before making a selection. Once a qualified engineer is selected, the scope of services and fee can be negotiated. If a reasonable fee cannot be agreed upon, negotiations will terminate and discussions can begin with another qualified engineer. It is best, however, if design costs become a factor only after a well qualified professional has been identified.

1.3 Contractor's Role and Selection

The contractor's primary role is to construct the dam and the appurtenant works in accordance with the plans and specifications. It is the contractor's responsibility to notify the engineer of any changes in the site conditions exposed during construction that vary from those shown on the drawings, in the specifications, or in any documents on site investigations. The contractor is responsible to see that the construction is conducted in a safe manner, that all state, federal and local regulations are adhered to during construction, and that the construction site is secure. The contractor is not responsible for the design of the

dam or modifications to the design made by the engineer. The contractor is responsible for all construction activities including the quality of workmanship used to construct the dam.

Selection of a qualified contractor is very important. The owner, in consultation with the engineer, should pre-qualify potential bidders. Requests for bids or quotes should be requested from contractors on the pre-qualified list. Items to be considered in the pre-qualification process vary. As a minimum, they should include previous experience in constructing dams comparable in size to the project, a history of satisfactory construction performance, adequate manpower and equipment to complete the project in a reasonable time frame, sufficient financial resources, a history of paying subcontractors, familiarity with local conditions, and a past record of displaying a cooperative attitude. Request and contact references.

The owner should select the best-qualified contractor who responds to the request for bids with a reasonable price for the work. A private owner is not required to select the lowest bidder; a governmental owner may, however, be bound by its enabling statutes to select the lowest bidder. An unusually low bid should be viewed with skepticism. It may be that the contractor has idle resources that are available to do the job, or it may be an indication that the contractor has forgotten something, is inexperienced, or follows a practice of bidding low then negotiating costly change orders during the project.

Bonding of the selected contractor should be included in the contract documents. The contractor should be required to obtain both performance and payment bonds. Payment bond references should be contacted. The contractor should warrant the work against defects for a period of at least one year after completion of the work.

1.4 Project Concept

Prior to constructing a new dam, or modifying an existing dam, certain engineering tasks are typically required to investigate, plan, analyze, and design the project. In many cases environmental, legal, real estate, utility, archaeological, historical, cultural, and other considerations related to a project are investigated and incorporated into project analysis and design. The determination of critical site information during earlier stages of the dam project may have a significant impact upon later stages of the project.

Phased design and construction is a process that should be seriously considered when difficult site conditions are encountered. Dividing a dam project into phases provides all parties with more time to make a reasonable determination of the anticipated scope and costs of the associated investigation, planning, analysis, and design work to be provided in each specific phase. Upon completion and review of each phase, the Project Engineer is better informed and prepared to advise the owner regarding tasks which will be necessary for the next phase. Estimates for construction quantities and costs are continually refined after each phase of the project as more accurate information concerning site conditions and suitable design alternatives becomes available.

Phased design and construction provides intermediate opportunities to discuss information and conditions determined during each project phase with regulatory agencies and stakeholders. Critical input concerning acceptable design methods and procedures can be obtained for application in subsequent phases.

Because the construction of a dam involves a significant financial investment, a primary advantage of phased design and construction is the opportunity it affords an owner to consult with the Project Engineer concerning the overall project and financial direction. Since dam projects are typically complex and very site specific, construction techniques and the scope of work may need to be changed to accommodate site conditions.

Actual project phases may vary and some overlap may occur. Depending on the length of time required to complete each phase, previous data may become obsolete and may need to be updated. Following are typical phases of a dam project through construction:

1.4.1 Reconnaissance Study – This is normally the initial phase of a dam project and involves the following tasks: site inspection of suitable locations for a new dam (or the evaluation of site conditions at an existing dam); discussion of the project goals and objectives with the owner; review of property ownership issues; investigation of available information and previous studies of existing dams; determination of general watershed characteristics, which include geologic conditions, soil conditions, preliminary hydrologic factors, possible access locations, potential downstream effects, and the hazard classification of the dam; evaluation of the potential for future downstream development that might increase the hazard classification during the life of the structure; determination of archaeological or historical limitations; determination of local, state, and federal regulatory jurisdictions; preliminary discussions of the project with regulatory personnel; initial discussions of the project with technical professionals in other disciplines and environmental professionals; and if possible, initial discussion of the project with a suitable contractor(s).

A site reconnaissance can disclose a number of surface features that may provide an indication of the subsurface conditions that exist at the site. These observations involve such items as the extent of alluvial depositions, topography, rock outcroppings, karst features, mining, and vegetative cover. A review of published data, including the geology and general soil conditions of the site, will provide significant additional information. Depending on the complexity of the project, other preliminary evaluation techniques may be considered. This information assists the owner and the design engineer in establishing the best preliminary conceptual design for the project, and provides valuable information concerning those areas where more detailed geotechnical evaluations should be concentrated.

1.4.2 Feasibility Study - Based on the preliminary discussions and the information obtained during the reconnaissance study, a preliminary estimate of anticipated engineering costs, mitigation costs, and possible construction costs is determined. This information provides the owner with an initial opportunity to determine whether the

project is financially feasible prior to further expenditures. It is extremely important to remember that preliminary estimates developed during this phase of the project are based on incomplete information and therefore represent only rough estimates of the possible magnitude of the project. These preliminary estimates are not intended to be applied or construed as final project costs.

1.4.3 Preliminary Engineering - During this phase of the project, limited information is obtained through field surveys, geotechnical field testing, and laboratory testing. Studies are undertaken to develop suitable alternatives, including initial estimates of quantities and costs. The Project Engineer assembles a team of qualified technical professionals, based on the project requirements. Suitable topographic maps may be developed from field survey data, a geotechnical report is published, hydrology and hydraulic analysis are conducted, and an environmental reconnaissance is performed. Other studies (water yield, sediment storage, mine tailings storage, etc.) may be performed depending on the scope of the project.

Upon completion of development of suitable alternatives, the Project Engineer presents the results of the preliminary engineering phase, including recommended alternatives to build or improve the dam, to the owner.

1.4.4 Design Phase – After an alternative is selected by the owner, the Project Engineer oversees the final design and preparation of the engineering report, construction plans and technical specifications.

Additional field survey information, geotechnical testing and analysis, environmental reconnaissance, and other technical studies may be required.

Upon completion of the construction plans and specifications, quantity estimates and costs are determined.

1.4.5 Permit Phase - Permit applications for all Local, State, and Federal regulatory agencies having jurisdiction over the project are completed, submitted, and public notice is provided.

1.4.6 Construction Bid Phase – When applicable, construction bid documents are prepared by the Project Engineer's professional team, which provide rules and guidelines for the construction bid process. The construction plans and technical specifications are included as part of the bid documents. Pre-qualification requirements for bidders are established. Requests for bids are distributed to suitable contractors. After receipt of bids, the owner, with the advice of the Project Engineer, selects the best-qualified contractor providing a reasonable price.

1.4.7 Construction Phase - After receiving all permits and approvals, acquiring all necessary property control (property ownership, easements and right-of-ways), and selecting a contractor, construction scheduling and construction activities begin.

Field survey services are used to stake and verify construction locations, alignments, elevations, and grades.

The Project Engineer should be retained to provide construction management services and monitor the construction of the dam. Material testing should be conducted throughout construction to verify that specifications are met. The Project Engineer or a member of the technical team involved in analysis and design should be available for inspection, observation and consultation during all construction activities, especially the excavation of the core trench, the installation of conduits through the dam, the installation of internal drains, and the placement of embankment fill. Because the most dangerous time in the life of a dam is first filling of the reservoir, the Project Engineer should be involved in monitoring this critical phase of the project.

Upon completion of construction activities, the Project Engineer prepares as-built drawings which note any changes or deviations from the approved design/ construction plans and submits the as-builts to the Division of Water.

1.5 IDNR Permit

These Guidelines supplement the Technical Review information in Chapter 5 of the 1996 Indiana Department of Natural Resources Permit Manual. The guidelines provide property owners and their design consultants with general information related to the technical permit requirements for dams in Indiana.

Items related to the completion of the Construction in a Floodway Permit application, environmental issues, and easements are addressed in IDNR's 1996 Permit Manual and should be followed when preparing a permit application.

Prior IDNR approval (permit) should be obtained by anyone desiring to construct or significantly modify (work that is not routine maintenance) a dam before work begins, if the dam meets any one of the following criteria:

- The drainage area above the dam is one (1) square mile or greater.
- The height of the dam, measured from the natural streambed below the crest of the dam to the lowest point on the crest, is equal to or greater than 20 feet.
- The volume of water impounded by the dam at the emergency spillway elevation, is 100 acre-feet or more.

If a permit is required for the proposed project, it will be necessary for the property owner to obtain the services of a registered professional engineer experienced in dam design, construction, repair and maintenance to take responsibility as the Project Engineer.

In order to expedite the permit process, the Project Engineer should meet with the Division of Water staff to discuss details of the project before work commences on the plans,

specifications, and engineering report. It is important that all survey, hydrology/hydraulic, geotechnical, structural and mechanical engineering evaluations are complete and accurate prior to submitting an application for a permit. It has been the staff's experience that when incomplete technical information is submitted with the application, the permit process is delayed months and in some cases years.

1.6 Emergency Action Pans

1.6.1 An Emergency Action Plan (EAP) is a formal plan that identifies potential emergency conditions at a dam and outlines the procedures to follow to minimize property damage and loss of life. All high hazard dams should have an EAP (see Appendix B for an outline).

1.6.2 An EAP is needed to preplan the actions taken by the dam owner, State Emergency Management Agency (SEMA) personnel, and local emergency officials during an emergency. This preplanning will help provide for timely notification, warning, and evacuation in the event of an emergency.

1.7 Enforcement Actions

Indiana Code 14-27-7, requires owners to keep their dam in a state of repair and operating condition required by the exercise of prudence, due regard for life or property, and the application of sound and accepted engineering principles. Routine maintenance and compliance with the conditions of the permit are required. A sample owner's inspection checklist is included in Appendix B.

The Division of Water inspects existing dams to determine their condition and continued compliance with state laws, regulations, and policies.

Occasionally, an owner will choose not to maintain the dam or will resist complying with the Indiana Code provisions for constructing and operating a safe dam. Depending on the seriousness of the situation, the Division of Water has several processes for bringing the dam into compliance ranging from certified letters to appropriate litigation. Fines can be issued and the dam can be breached at the owner's expense.

Field Survey

Section 2
FIELD SURVEY

2.1 Introduction

Collection of accurate field survey information is critical to determine existing site conditions, prepare suitable designs, and successfully construct a dam. Accurate field survey information is required for many aspects of a dam project. Listed below are some of the common, acceptable survey principles that are used by professionals practicing in the dam safety field.

2.1.1 Accuracy

The field survey information necessary for designing dams and spillways, developing construction plans, and verifying construction activities is typically required to be accurate, both horizontally and vertically to a minimum of 0.1 foot, except for preliminary and reconnaissance surveys, where horizontal accuracy of one foot may be acceptable. In certain situations, additional accuracy to a minimum of ±0.01 feet may be necessary.

Although less accurate (nearest foot) site information can be used in preliminary stages of the project to determine alternatives and quantity estimates, the Project Engineer should assess the approximate accuracy of this information to make sure reasonable estimates of locations, alignments, grades, and quantities are obtained.

2.1.2 Datum

Temporary benchmarks (TBM) should be established at the dam and tied to an NGVD vertical datum. TBM's can be used to obtain reliable survey data to design, construct and monitor the performance of the dam throughout the project life. Use of established datums connects the dam to other surveys and maps in the area, and enables the Project Engineer to use information from other sources.

Vertical control (elevations) is typically established on the National Geodetic Vertical Datum of 1929 (NGVD'29) or the North American Vertical Datum of 1988 (NAVD'88). Assumed datums may be suitable for minor improvements or repairs.

Horizontal control is important to verify property boundaries and determine the extent of the reservoir at both normal and maximum pool. Control stations for horizontal control should be established on the North American Datum of 1927 (NAD'27) or the North American Datum of 1983 (NAD'83) using Indiana State Plane Coordinates in U.S. Survey Coordinates (feet) or Universal Transverse Mercator (UTM) coordinates (meters). If a sufficient number of permanent survey markers are placed at a site, an assumed datum may be appropriate to monitor the long term performance of a dam.

2.1.3 Property Boundary

The Project Engineer should determine the project boundary and property boundary for the site. This information should be shown on the plans as well as any easements for property that may be inundated by the reservoir during the design flood.

2.2 Topographic Mapping

Development of accurate topographic mapping is desirable in the initial stages of a dam project in order to establish existing locations, alignments, and grades. The topographic information should provide reasonable accuracy for the determination of alternatives and preliminary estimates of quantities. Development of suitable contour information for proposed or existing impoundment areas is especially important in determining stage-storage relationships for the hydrologic/hydraulic analysis.

Due to the extensive areas involved in large dam projects, application of aerial photogrammetry is usually an appropriate and economic alternative for the development of suitable topographic mapping and site layout information. Field surveys are required to establish the coordinate locations and elevations of specified ground control points prior to development of the topographic mapping by aerial photogrammetry. These temporary monuments establish the necessary horizontal and vertical control to develop a topographic map of the site. It is important to note that topographic information developed from photogrammetry is typically accurate to only one half the contour interval of the topographic mapping. For example, elevation information derived from a photogrammetrically compiled map with a contour interval of 2 feet has an accuracy of ±1 foot.

Adjacent property boundaries, utilities, and other important geographical features are determined from appropriate sources and located to the accuracy required on the project site mapping. If appropriate, accurate locations and descriptions of sensitive environmental areas and archaeological resources should be delineated on the project site mapping.

A hydrographic survey of the bed of the lake at an existing dam may be needed to determine storage for a sediment or water supply study.

2.3 Field Survey for Geotechnical Testing

Field survey information is typically required in conjunction with geotechnical testing to precisely locate test borings and provide accurate cross-sections of existing dams at specified locations for stability analysis.

2.4 Field Survey for Hydrology and Hydraulics Analysis

Field survey information required for the hydrology and hydraulics analysis includes the determination of spillway control elevations and structural details for spillways at both new and existing dams. These details include the type of structure, location, size, alignment, inlet

and outlet elevations, length, outlet type, and other requested structure characteristics to determine losses in both open channels and closed conduits. Accurate determination of an existing lake pool elevation is important to help establish the stage-storage relationship for reservoir routing calculations.

Profiles and cross-sections of natural and man-made channels into which existing or proposed spillway structures will drain are typically required to determine potential backwater effects at spillway structures, the need for channel armor protection, and the design of energy dissipation devices.

For existing dams that have lake drawdown structures, inlet and outlet invert elevations, the length, diameter, and material of the pipe and the size and description of all valves, should be determined.

Finally, for both existing and proposed dams, information about downstream structures (i.e. culverts, bridges, dams, levees, placed fill, etc.) that may restrict flows and result in backwater effects at spillway structures should be determined. It is important that the datum used at any other structure be the same datum that is used at the dam.

2.5 Field Survey for Preparation of Final Designs and Construction Plans

Prior to the preparation of final designs and construction plans for a new dam or improvements to an existing dam, extensive field survey information is required to accurately define the physical characteristics of the project site. Field survey cross-sections should be obtained at intervals along the centerline of a proposed or existing dam and at appropriate intervals along the length of emergency spillways.

2.6 Construction Survey

Prior to the actual construction of the dam, a construction survey is necessary to stake actual locations, alignments, and grades of structures shown on the construction plan. During construction, additional field surveys may be required to verify information on the construction plans and to determine accurate construction quantities. It is recommended that the bottom of the core trench, internal drains, pipes through the embankment, and buried structures be surveyed before backfilling occurs.

2.7 Post Construction Survey

An as-built survey is typically performed after the completion of all construction activity to determine if the structure was built according to the plans. In some instances, the as-built survey data is used to perform hydraulic, hydrologic and geotechnical computations to verify that the dam meets minimum safety requirements.

On some dams, typically only large high-hazard dams, annual or other periodic surveys are conducted to monitor movement of the embankment and appurtenant structures.

Geotechnical and Geological Considerations

Section 3

GEOTECHNICAL AND GEOLOGICAL CONSIDERATIONS

3.1 Introduction

The identification of the site characteristics, engineering properties of the materials used to construct the dam, and geologic conditions beneath the embankment are essential to the design of a safe dam.

The geotechnical and geologic guidelines that follow are predicated on a "typical" project, generally involving a small or medium sized dam at a site with few geological challenges. It should be understood that each and every project is unique, and the geotechnical requirements may be modified accordingly. The type and quantity of field and laboratory tests conducted and the types and numbers of analyses performed will be influenced by the hazard classification and project function. A limited geotechnical investigation may be allowed on small, low-hazard dams while a comprehensive investigation is recommended for large, high-hazard dams. Unauthorized dams will require a geotechnical investigation and the same geotechnical computations as a new dam.

Structures in heterogeneous geologic settings, such as solutioned limestone or lakebed sediments may require extensive geotechnical studies. Subsurface conditions can change dramatically across a valley. Larger dams and dams with very long crest lengths may necessitate additional geotechnical investigations to properly assess the subsurface conditions.

Geotechnical evaluations for the rehabilitation of existing dams should consider the seriousness of the deficiencies. For major rehabilitation projects such as repairing breached dams, increasing the height of a dam, permanently raising the normal pool elevation of the reservoir, repairing embankment slides, modifying excessively steep slopes, and constructing control structures for extensive uncontrolled seepage and piping, the geotechnical evaluations should essentially be the same as that utilized for a new dam. The evaluation should be modified, as necessary, to target the major deficiency(s) identified. Limited geotechnical evaluations are typically acceptable for minor rehabilitation projects such as minor seepage, unsuitable vegetation and minor slope reconfiguration.

3.2 Literature and Initial Review

The development of the subsurface exploratory program should begin with a literature review of existing geologic and geotechnical maps, reports, and other records that might provide technical background information on special conditions at the site and the surrounding area**.** The project details will dictate the extent of the literature search that would be beneficial in the development of the subsurface exploration program. Listed below are some sources of information that may prove helpful.

3.2.1 Geologic Maps and other geologic information

State geologic mapping will provide an indication of the geologic setting of the site. Local, detailed geologic mapping and pertinent information may be available in or near the project area. The Indiana Geological Survey (IGS) located in Bloomington has a wealth of information on the geology of the state and trained professionals that can assist in the interpretation of this information. General information about the IGS can be obtained from the web site "http://adamite.igs. indiana.edu/index.htm".

3.2.2 Soil Surveys

All Indiana counties have existing soil surveys that contain information on the surficial soils. These are particularly useful in the preliminary phase of planning a subsurface exploration program. Almost all counties have a Natural Resources Conservation Service office staffed with technical professionals that can address general soil conditions of the site.

3.2.3 USGS Topographic Quadrangle Maps

Topographic maps provide a general characterization of the surface features of the area under investigation and the drainage patterns which may influence site selection. U.S.G.S. 7 ½ minute topographic maps are available for the entire state. More detailed topographic mapping may be available for certain local areas.

3.2.4 Other Sources of information

- Aerial Photographs
- Well Records
- Technical publications pertaining to the area
- Technical records or inspection reports on existing dams near the site
- Special maps (abandon coalmines, underground caves, etc.)

3.3 Site Reconnaissance

A thorough reconnaissance of the entire site and adjacent areas by the Project Engineer and the geotechnical engineer or engineering geologist is considered to be essential for both new dams and major modifications to existing dams. Typically, a reconnaissance is performed prior to implementing the exploration program to determine the best methods to employ. Additional site reconnaissance may be conducted during or after the field program to help interpret the data being obtained. Vegetative cover, rock outcroppings, and small topographic features (that may not be discerned from the literature review alone) provide useful input.

The primary emphasis of the site reconnaissance is the area within the embankment footprint and areas immediately upstream and downstream. These would include the creek bottom, flood plain, abutments, and any potential open channel spillway alignments within the abutments or areas removed from the dam site. In certain instances, the reconnaissance may include the entire reservoir footprint. It is very important for the reconnaissance team to include the land owner in the site reconnaissance to help identify potential borrow sources and locations of unusual geologic conditions such as rock outcroppings, caves, and springs. A downstream inspection is recommended to better identify the hazard classification.

3.4 Geologic Mapping

Site-specific geologic mapping may be warranted in some instances. This would be particularly applicable to large dams, and those located in unique geologic settings. The applicability of such a method (prior to the subsurface exploration program) is directly related to the amount of rock outcropping that may be identified during the site reconnaissance. In the absence of outcroppings, geologic mapping may be of limited use. Where shallow rock exists, that is not otherwise exposed, test trenches may be appropriate to expose these materials for direct observation.

3.5 Subsurface Exploratory Program

The objective of a successful subsurface exploration program is to strategically obtain samples and pertinent information for an engineering evaluation of all the materials that will affect the performance of the dam and appurtenant works. The Project Engineer should balance the use of in-situ exploratory procedures with the option of obtaining both disturbed and undisturbed samples for laboratory testing. On large dam projects, strength and permeability tests are usually performed on undisturbed foundation samples and remolded samples of borrow material. For small, low hazard dams, laboratory identification tests of bagged samples can be used to obtain assumed shear strength and permeability parameters. The use of conservative shear strength parameters may result in an over-designed structure, thus the Project Engineer must balance the cost of exploration with the cost of over-designing and over-building the dam. Using assumed shear strength parameters may be a reasonable approach for small, low hazard dams, but should not be used for large dams. The use of a haphazard approach to subsurface exploration wastes money and can lead to the design and construction of a potentially unsafe dam where failure may result.

3.5.1 Test Borings

Test borings are typically placed within the footprint of the dam and appurtenant structures. Boring locations on existing dams should target the specific deficiencies identified while considering accessibility to the site. For existing dams with minor deficiencies where sufficient documentation concerning the design, construction, and performance of the dam is available, the need for borings may be minimal.

3.5.1.1 Centerline of the Dam - The number of test borings along the centerline of the dam should be based on the needs of the design. Past experience indicates that three borings along the centerline of small dams with a short crest length is adequate.

3.5.1.2 Embankment Toe - Borings at the upstream and downstream toe should be considered for most dams to delineate the soil stratigraphy in the valley.

3.5.1.3 Conduit and Internal Drain Locations - Additional borings may need to be placed beneath proposed conduit and drain locations to identify subsurface conditions within these specific areas. These borings can provide information to evaluate highly compressible soil layers, weak foundation soils, permeable anisotropic soils, and high ground water conditions.

3.5.1.4 Open Channel Spillways - Open channel spillways in the abutments are typically evaluated with borings, if significant depth of excavation is anticipated. These borings should at least penetrate the depths of excavation and identify the properties of the materials at the base of the channel.

3.5.1.5 Depths and Samples - Boring depths within the embankment footprint area will generally mirror the height of the embankment above each individual boring, with a minimum depth of 15 feet typical. Disturbed samples obtained by Standard Penetration Testing, or other suitable methods, are normally made on 2.5-foot intervals unless there is evidence that the material is relatively homogeneous in which case 5.0-foot intervals may be appropriate.

3.5.2 Test Pits

Test pits excavated with a backhoe can provide useful information in certain portions of the site. Several excavations often allow a more thorough assessment of the upper stratigraphy, and can provide indications of potential difficulties that may be encountered during construction. In situations where the dam is a small, low hazard structure and sound, tight rock is near the surface, test pits that may significantly reduce the quantity of borings. Otherwise the following should be considered:

3.5.2.1 Flood plain - Alluvial deposition is typically complex. Soil test borings alone often do not clearly represent the conditions encountered within flood plain areas. Test pits can provide a better indication of subsurface variability, depths of organic material, past seismic activity, and difficulties that may be encountered relative to groundwater inflow.

3.5.2.2 Shallow Rock - Test pits may be used to supplement the evaluation of general areas where shallow rock is encountered. This helps discern if the refusal materials are fairly continuous rock and whether the rock surface is uniform. This may be particularly useful at sites with karst geology.

3.5.2.3 Open Channel Spillways - Test pits may be an inexpensive means of evaluating areas where the depths of excavation anticipated for channel spillways are minimal.

3.5.3 Rock Coring

Some rock coring is recommended within the footprint of the dam if refusal is encountered at depths less than about half the originally planned boring depth, with appropriate consideration of the geology of the site.

3.5.3.1 Depths - The amount of rock core to be obtained in each hole depends on a number of factors including the size of the dam, geologic setting, and rock quality. Typically, a minimum of 10 feet of rock should be cored at each location.

3.5.3.2 Packer Tests - Packer permeability tests may be performed in conjunction with the rock coring where there is an indication the rock mass is jointed, solutioned, or has significant discontinuities. The Packer Test will assist the geotechnical engineer in determining the hydraulic conductivity of the rock mass (see section 3.7).

3.5.4 Preliminary Instrumentation for Piezometric Levels

The subsurface exploratory program may include the installation of observation wells or piezometers to establish the groundwater conditions within the footprint of a proposed dam or assess seepage-related deficiencies in an existing dam.

Strategically placed piezometers can provide valuable information on conditions in existing dams. For new dams, the installation of piezometers allows the geotechnical engineer to monitor pore pressures during first filling of the reservoir and throughout the life of the structure. This data can be used for analyses and for long term monitoring of dams. See Section 3.10 and Geotechnical Addendum/Instrumentation in Appendix C for further discussion.

3.5.5 Test Samples

3.5.5.1 Disturbed Samples - Split-spoon samples from borings and samples from test pits should be obtained for classification and correlation.

3.5.5.2 Undisturbed samples - A sufficient number of relatively undisturbed samples should be obtained to evaluate foundation materials, especially at large dams. A sufficient number of samples are needed to accurately characterize the differing types of materials present in the valley and abutments. Strength, compression, and permeability tests on undisturbed samples produce data that

is helpful in evaluating the stability of the dam and determining the expected behavior of the materials left in place to support the dam.

3.5.5.3 Bulk Samples - Disturbed bulk samples from test pits or auger cuttings are typically collected, particularly for explorations made in open channel spillway areas and potential borrow areas.

3.5.6 Other Exploration Techniques

Several other exploration techniques may be considered in special situations to address specific areas of concern. Examples include pressuremeter testing or cone penetrometer soundings, particularly in soft foundation materials that may be left in place to support the dam. Geophysical exploration techniques may also be appropriate in some instances.

3.6 Borrow Study

The ultimate purpose of a borrow study is to identify sufficient quantities of acceptable borrow materials that can be used in the construction of the dam. This can be accomplished by estimating the quantity of material needed in the dam and conducting adequate explorations and laboratory analyses to determine the soil profiles in the borrow areas.

3.6.1 Locations

It is important to locate the borrow areas far enough away from the dam so that any excavation below the top of dam elevation does not jeopardize the integrity or the performance of the structure. There are many site and project specifics that will dictate this distance. For small to medium sized dams situated on a geologically "good" site, the location of any borrow area that will be below the dam crest elevation should be kept 200 feet or more from the dam.

3.6.1.1 Open Channel Spillways - For projects involving the excavation of open channel spillways in the abutment areas, it is recommended that these materials be evaluated for use in the construction of the dam. See Sections 3.5.1.4 and 3.5.2.3.

3.6.1.2 Reservoir Area - Any portion of the reservoir area that will be excavated for borrow material should be investigated. Under no circumstances should bedrock be uncovered and left exposed in a borrow area that is within the reservoir boundary.

3.6.2 Exploratory Techniques

The exploration of potential borrow sites should be sufficient to characterize the usable soil deposits(s) both from a geological and engineering perspective. The study

should demonstrate homogeneity relative to the deposit(s) under consideration. Exploratory holes are typically placed on approximately 500-foot centers on a rough grid system at all practical locations.

3.6.2.1 Test Pits - Test pits are the preferred exploration technique for the evaluation of borrow sources where the potential depths of excavation are limited, or where the occurrence of suitable material is near the surface. Soil stratigraphy can be determined in more detail, and the variability and inclusion of unsuitable materials may be more readily observed with test pits. Discreet sampling of specific soil layers and combined sampling of two soils in the vertical profile can easily be done using this technique.

3.6.2.2 Borings - Auger borings are typically required where greater excavation depths are planned.

3.6.3 Sampling

Small grab samples of foundation, abutment, and borrow materials are useful for general classification purposes. Sealed samples of this type can be used to determine in-situ moisture contents. Bulk samples are required on all materials that may be used as embankment fill. Sufficient quantities of bulk material are obtained based on the types of laboratory tests to be performed.

3.7 In-Situ/Field Testing

In-situ testing, or field testing, may be considered in the evaluation of foundation conditions for new dams and in the evaluation of conditions within and beneath existing dams. Typical conditions that may warrant in-situ testing include soft compressible foundation materials that cannot be sampled routinely for laboratory testing, evaluation of seepage through foundations and existing embankments, evaluation of the continuity and integrity of foundation rock, and the determination of excavation quantities and methods.

The utilization of field test methods will depend on the size and length of the dam, the type and extent of foundation materials encountered, and the economic feasibility of a particular method over another. In-situ methods may be used to supplement more common exploration techniques such as soil test borings. Some geologic settings and embankment conditions may necessitate the use of one or more of these methods (see Appendix C - Geotechnical Addendum - Insitu/Field Testing).

3.8 Laboratory Testing

The laboratory testing program typically consists of soil classification and may also include a determination of shear strength parameters, permeability, and compressibility properties of soils. Appropriate in-situ tests may be considered for foundation materials. Laboratory testing of remodeled samples of potential embankment materials is typically needed to

determine the strength of the material. Depending on the size and hazard classification of the dam, a relatively extensive testing program may be required to characterize all of the material types in the foundation and the embankment**.** It may be necessary to perform duplicate tests on significant soil material types to verify a typical value of the material being tested.

3.8.1 Characterization Testing

This type of testing is typically performed to provide an indication of the engineering characteristics of the materials that will be used to construct the dam. These tests also provide identification of the different types of materials involved so that more extensive testing can be targeted to specific material groups.

3.8.1.1 Classification Tests - General classification tests, suitable for classifying soils by the United Soil Classification System (USCS), include gradation tests (sieve and hydrometer, as required) and Atterberg Limits tests.

3.8.1.2 Compaction Tests - Proctor compaction tests, and associated natural moisture content tests are needed to establish the basis for quality control during construction and to provide samples for strength testing. Standard Proctor compaction tests are typically utilized.

3.8.2 Strength Testing

Strength testing will normally be required to determine the shear strength parameters for the stability evaluation of both new and existing dams. Tests are typically performed on relatively undisturbed samples of foundation materials and existing embankment materials. Remolded samples of potential borrow materials are compacted to the minimum value allowed in the technical specifications and tested to determine the shear strength of the material that will be used to construct the new embankment. The state encourages engineers to perform triaxial tests on foundation and embankment soils for significant and high hazard dams. For small, low hazard dams, estimated shear strength parameters may be selected from published data in the Bureau of Reclamation's *Design of Small Dams* for the embankment and foundation material. Estimates should be based on the results of soil classification tests (Atterberg Limits, Sieve Analysis, and Hydrometer Analysis).

3.8.2.1 Triaxial Shear - Laboratory strength parameters are typically evaluated using consolidated undrained (CU) triaxial shear strength tests with pore pressure measurements. The CU test provides both total and effective strength parameters.

3.8.2.2 Direct Shear - Direct shear tests may be considered in certain instances. However, these tests are less accurate than triaxial tests and are becoming less common in the determination of strength parameters for earth dam stability computations.

3.8.2.3 Unconfined Compression - Unconfined compression tests can provide a general indication of undrained shear strength of clayey soils.

3.8.3 Consolidation Testing

Where settlement is an issue, an adequate number of consolidation tests on undisturbed foundation samples are needed to establish the settlement characteristics. Consolidation tests may also be performed on samples from proposed borrow areas that are remolded to provide reliable settlement and deformation data on each soil type proposed for the embankment.

3.8.4 Permeability Testing

Depending on the dam size and the embankment and foundation characteristics, permeability tests may need to be performed on undisturbed samples from the foundation of new and existing dams. When seepage is a concern in an existing dam, permeability tests of undisturbed embankment materials may be necessary. For new dams, remolded samples of proposed borrow materials may require permeability testing. These tests are typically performed on saturated samples to establish hydraulic conductivity characteristics of the various soil types involved. Both falling and constant head tests can be performed.

3.9 Geotechnical Analyses

Appropriate geotechnical analyses are performed to determine the geometry of the dam, the size and location of internal drains, the location of conduits within the embankment, and the location of appurtenant structures. The accuracy of these analyses depends on the validity of the parameters and assumptions developed in the preceding sections. Additional field and laboratory work may be necessary to improve the accuracy of the geotechnical models that are used by the engineer. Critical sections of the embankment should be evaluated for all expected loading conditions that could occur during the life of the dam. The intent of the geotechnical analyses is to design a safe and satisfactorily functioning structure at the lowest feasible cost.

The geotechnical design typically includes the following:

1. Provisions for monitoring the performance of the dam and maintaining the structure to assure satisfactory performance throughout its design life.

2. Evaluation of the stability of the structure during construction, at the end of construction, and during steady seepage conditions.

3. Evaluation of the stability of the dam and appurtenant structures during and after seismic events.

4. Evaluation of the stability of the dam and appurtenant structures during a rapid drawdown of the reservoir.

5. Ability of the embankment, internal drains, and appurtenant structures to experience minor consolidation settlements without adverse affects.

6. Monitoring, collection, and control of seepage through the embankment, foundation and abutments.

3.9.1 Stability Analysis

The purpose of a slope stability analysis is to determine a factor of safety for the embankment which is defined as the ratio of resisting forces (gravity forces and soil shear strength) to driving forces (gravity forces and shear stresses) along the critical potential failure surface.

For existing dams, the primary purpose of the stability analysis is to determine if the embankment is stable under various loading conditions. A stability analysis can be used to evaluate a slope failure that has occurred, design modifications to improve the stability of the embankment, or evaluate proposed changes to the height of the dam or the reservoir elevation. Loading conditions are typically limited to steady seepage-full pool, steady seepage-maximum pool, rapid drawdown, and seismic events.

For new dams, the purpose of the stability analysis is to design an embankment that will meet minimum factors of safety for a variety of loading conditions. These include loading during construction and at the end-of-construction. During the placement of fill, the construction schedule and any external loading should be considered in the analysis of the embankment. The end of construction condition is typically only of concern when rapid fill placement occurs on very soft foundations and undrained conditions occur. The steady state stability of the downstream slope should be analyzed under two loading conditions: the reservoir at the normal pool elevation after development of the steady state phreatic surface and the reservoir at the maximum pool elevation. Where drawdown facilities exist, the stability of the upstream slope is analyzed under rapid drawdown conditions. In limited instances, rapid drawdown due to submergence of the downstream toe may be a consideration. In high seismic zones, a seismic stability analysis should be performed for the downstream slope using an appropriate factor of gravity (i.e. 0.15g) for the design acceleration.

For the end-of-construction condition, the shear strengths of the foundation and dam fill are typically evaluated using total stress conditions (undrained shear strength) where the fill is placed rapidly upon the foundation materials and excess pore pressures have not dissipated. Where the foundation materials are very fine grained

and the build-up of excess pore pressure could be detrimental, piezometers should be installed in the foundation to monitor the pore pressure during construction.

For steady state conditions, the stability analysis should be performed under the assumption that the phreatic surface has been developed. The phreatic surface will begin at the "normal" pool elevation of the upstream face and extend to either the internal drainage system or the downstream slope of the dam, as determined through use of constructed flow nets or finite element seepage analysis. Drained shear strength parameters should be used to evaluate the dam under steady seepage conditions.

Drawdown pipes are encouraged for all dams, especially high hazard dams. Valves should be placed at the upstream end of the pipe to prevent the pipe from being pressurized when it is not in use. Rapid drawdown could occur if the reservoir is lowered at a rapid enough rate to prevent dissipation of the pore pressures at the upstream face of the dam. For dams built of cohesive soils, excess pore pressures may result if the drawdown exceeds 1 foot per week. This could cause an upstream slope failure that could damage the embankment and ultimately lead to the breaching of the dam. A rapid drawdown stability analysis is performed using drained shear strength parameters for the embankment. The reservoir is assumed to be at the invert elevation of the drawdown pipe and embankment pore pressures are computed with the reservoir at normal pool.

After completion of the static analyses, each of the loading considerations should be analyzed considering the appropriate seismic ground acceleration forces. Typically a pseudo-static analysis of only the downstream slope at steady state seepage conditions is performed.

Stability analysis for earth embankments should consider both slip circle methods such as Bishop, Spencer, Morganstern-Price, or Janbu's, and when appropriate, sliding wedge analyses. There are numerous computer programs which are accepted by IDNR’s Division of Water for the performance of stability analyses. The geotechnical engineer is responsible for verifying that the computer stability analyses are correct.

3.9.2 Seepage Analysis

Water will seep through all earth embankments over a period of time. Therefore, it is imperative that this seepage be recognized, monitored, and controlled. A seepage analysis may be necessary to determine pore pressures within the embankment, assess the effectiveness of seepage control options, provide quantitative data for the design of seepage control structures, and predict seepage behavior of the embankment and foundation. The analyses can assist in locating piezometers for use in monitoring seepage through the embankment and foundation.

After the phreatic surface has developed, the permeability of the embankment and foundation materials will determine the seepage flow rate. If the rate is excessive, seepage reduction and seepage collection techniques may be needed. The quantity of seepage flow, the hydraulic gradient through the dam, and the long-term effects of the exit gradient on embankment performance are of particular interest to the geotechnical engineer. Seepage reduction techniques such as cut-off keyways, slurry walls, clay core zones, and grout curtains should be considered. The seepage analysis can be used to select the most effective type of internal drainage system for the dam and foundation.

Permeability data is typically obtained from appropriate laboratory and field tests. The seepage analysis should be performed on the maximum dam cross-section upon completion of the field and laboratory testing. Either a graphical flow net analysis or a more sophisticated numerical finite element model can be used.

Analytical models will aid the geotechnical engineer in determining critical seepage areas within the dam and appurtenant structures. These include areas of excess pore pressure and high gradients. The analysis should consider the proposed drainage system to allow accurate modeling of the phreatic surface, and exit gradients at the toe of the dam. Such analysis will aid in determining if special seepage devices, such as relief wells, will be required in the final design.

It is imperative that the geotechnical engineer be aware of the implications of the seepage analysis. It is always advisable to perform an independent check of any computer calculations to verify that the results are reasonable and within tolerable limits for the structure.

3.9.3 Settlement Analysis

Both the new embankment and the foundation soils will consolidate beneath the weight of the embankment materials. The amount and rate of settlement will depend on the consolidation characteristics of the underlying soils and the rate of pore pressure dissipation. Settlement of the embankment can result in loss of freeboard, depressions on the dam crest, differential settlement along conduits which penetrate the dam, and in extreme cases, transverse cracks that can lead to failure of the dam. Excessive settlement can cause misalignment of conduits, separation of joints, and possible conduit failure which results in leaking and possible soil piping (internal erosion of embankment soils).

It may be necessary to analyze settlement to determine foundation treatment and camber, for the embankment and appurtenant structures. Laboratory consolidation tests should be performed to determine the consolidation and drainage characteristics of the embankment and foundation materials. The geotechnical engineer should consider performing a one-dimensional settlement analysis, which considers the variable loadings across the dam footprint to determine areas of critical movement. If

differential settlement and cracking of the embankment is possible, the geotechnical engineer should consider chimney drains, settlement accommodation along conduits, and joint extensibility for any jointed conduits. The effects of the calculated vertical movements on both the embankment and the appurtenant structures should be carefully considered in the design.

3.10 Instrumentation

Various instrumentation devices are typically required in the construction of large, high-hazard dams, and may be necessary on existing dam rehabilitation projects. Instrumentation can be installed to monitor the performance of the dam during construction, during initial reservoir filling, and during the life of the structure. Foundation and embankment performance may be monitored with piezometers, settlement devices, inclinometers, and seepage measuring devices. Other less common instrumentation may be considered for unusual conditions. Any instrumentation selected should target specific items to be evaluated, establish critical thresholds that suggest the need for a specific action, and establish the details of the monitoring program (see Appendix C - Geotechnical Addendum Instrumentation).

3.11 Geotechnical Report

Once the field exploration, laboratory testing program, and geotechnical analyses have been completed, a final report outlining these items as well as the geotechnical aspects of construction should be prepared. A wide range of report formats is possible. However, the following items should generally be included.

3.11.1 Introduction

A general statement of the purpose of the geotechnical study.

3.11.2 Project Information

A detailed description of the project being evaluated should be documented as part of the report. This is particularly useful if the design changes significantly from the time the geotechnical study was performed to the completion of the design documents.

3.11.3 Exploration Procedures

This section should include a description of the field and laboratory testing procedures utilized in the study.

3.11.4 Site Description

A brief description of the surface features of the project area is helpful. This includes

the project location, surface topography, vegetative cover, and identifiable surface features. The site description essentially summarizes the site reconnaissance observations.

3.11.5 Subsurface Conditions

A brief summary of the subsurface conditions identified by the field exploration program should be included. This summary generally identifies the major types of materials encountered and provides correlations between borings based on the data obtained. This section of the report identifies information gleaned from the desktop study and any geologic field mapping of the site. The intent of this section is to relate the identified subsurface conditions to the known geologic conditions at in the site, and set the stage for addressing any special or unusual conditions in the conclusions and recommendations section(s) of the report.

3.11.6 Findings

This section summarizes the results of the stability, seepage, and settlement evaluations. The results should be placed in this section or intertwined with other sections of the report. By summarizing the evaluations that were performed, the basis for the design, construction conclusions, and recommendations are established.

3.11.7 Conclusions and Recommendations

This section of the report is the most critical and should identify all of the geotechnically related design and construction items that will impact, and be incorporated into, the design contract documents. Design and construction related conclusions and recommendations might be separated or combined. Any areas of uncertainty, such as items that can only be resolved by further evaluation during the actual construction process, should be clearly identified in this section. The following items should be addressed in this significant portion of the geotechnical report.

3.11.7.1 General Assessment - A brief summary of the more significant conclusions and recommendations is included, identifying unusual or critical items that should be addressed in the design and construction.

3.11.7.2 Site and Subgrade Preparation - Recommendations concerning clearing, stripping, and grubbing of the embankment footprint area, spillway locations, and potential borrow areas should be included. All disturbance and excavation limits should be based on safety considerations. Typically, the area beyond the toe of the dam is cleared to minimize root invasion.

3.11.7.3 Foundation Preparation - Recommendations concerning undercutting and replacement of unsuitable materials should be included in this section.

Special foundation preparation techniques are included to deal with partial undercutting of alluvial soils and the preparation of exposed rock foundations.

3.11.7.4 Groundwater and Dewatering - Dewatering requirements to construct the project should be identified. Specific areas that will likely require dewatering, and the extent to which groundwater lowering is needed, should be addressed. General information on the anticipated types of dewatering systems that would be appropriate should be presented.

3.11.7.5 Surface Water Diversion - A general discussion of the need to route surface flows from the drainage basin around and through the construction work area should be identified.

3.11.7.6 Seepage Considerations - The seepage evaluations should include estimates of potential seepage quantities, as well as any seepage reduction and seepage collection techniques needed. Seepage reduction techniques such as cutoff/keyways, slurry walls, clay core zones and grout curtains should be identified. Internal drainage system recommendations should be made for any foundation and embankment drains that are needed. Details concerning gradations of drainage aggregates, filter requirements, the need for special items such as relief wells, and locations and minimum dimensions for drainage components should be addressed.

3.11.7.7 Embankment Geometry - The maximum recommended slope inclination should be specified based on the results of the stability evaluation. The need for toe berms, wave berms, and minimum crest widths should be discussed as well as drainage considerations for the surface of the embankment. Any requirements for zoning within the embankment should be included, specifically addressing material properties that are considered appropriate for each zone within the dam.

3.11.7.8 Earthwork Recommendations - This section of the report should include the material types and quantities identified in potential borrow areas. It should specify minimum compaction requirements and moisture control for all fill material placed during construction. Borrow site management should be addressed. Details concerning the placement procedures for the earthwork operations to assure adequate bonding between lifts, control of overly wet, dry or frozen materials, cross slopes, and management of the fill pad should be provided. Minimum testing recommendations for the earthwork should be included.

3.11.7.9 Settlement - Estimates of settlement, particularly at critical structure locations, should be provided if compressible foundation conditions exist. In conjunction with the settlement assessment, anticipated settlement along

conduits and the associated joint extensibility for any jointed conduits should be described. The potential for excessive differential settlement should be discussed as well as any special foundation preparation techniques or design requirements, such as internal drainage systems and chimney drains. Typically, the settlement estimated at the base of the dam, as well as the settlement within the fill material should be provided. The need to compensate for any potential settlement, including cambering of the crest, special construction sequencing and surcharging requirements should be addressed.

3.11.7.10 Principal Spillway/Conduits - Any special embedding requirements for conduits that will penetrate the dam should be addressed. This would include concrete cradle requirements, filter collars, the need for camber in the pipe to accommodate settlement, and special backfill requirements adjacent to conduits. Allowable bearing pressures for outlet structures should be provided along with any special foundation preparation techniques appropriate for these areas.

3.11.7.11 Emergency/Open Channel Spillways - Items related to the excavation of any open channel spillways in the abutment areas should be addressed. The erodability index of materials exposed at the proposed finish grade should be determined for use in erosion calculations. The suitability of using excavated materials in the embankment, groundwater considerations, and the potential for difficult excavation should be considered. Armored spillway channels in abutment areas or on the embankment should provide details concerning seepage reduction and underdrainage system requirements.

3.11.7.12 Erosion Control - The need for shoreline wave protection, vegetative cover, berms, and protection of critical areas from surface runoff should be considered. Recommendations for positive erosion protection techniques such as riprap should include the bedding requirements for these materials.

3.11.7.13 Other Considerations - Any special requirements for items such as slurry walls, foundation grouting, and special consideration of the geology in which the site is located should be addressed in the geotechnical report. In essence, any geotechnical issues, which may impact the subsequent design and construction of the project, should be considered.

3.11.8 Instrumentation

Minimum instrumentation requirements should be included in this section. These recommendations should include types of instrumentation, locations, and the general approach to be used in monitoring and reporting the data.

3.11.9 Construction Monitoring

The report should address requirements related to the geotechnical evaluation and construction materials testing that will be required during construction. This includes the level of experience of the individuals responsible for testing and monitoring, general testing requirements, and identification of the specific areas that require monitoring. For large, high hazard dams, full-time monitoring of all phases of the construction is required.

3.11.10 Appendices

3.11.10.1 Supporting Data - All of the field and laboratory test results should be included as appendix items. Exploration location plans, subsurface profiles, boring records, laboratory test results, and any special details should be included.

3.11.10.2 Analyses - The actual calculations required for stability, seepage and settlement, as well as any other specific geotechnical calculations performed as part of the basis for the geotechnical study, should be included. This may be as an appendix item to the geotechnical report or may be submitted as a separate document along with the geotechnical study.

Hydrology
and
Hydraulics

Section 4
HYDROLOGY AND HYDRAULICS

4.1 Introduction

A spillway system must be capable of safely passing the runoff from the design storm event without the embankment overtopping and failing. The magnitude of the design storm depends on the hazard classification. A hydrologic analysis of the watershed and a hydraulic evaluation of the spillways are required to design an appropriate spillway system and determine the minimum crest elevation of the embankment.

The hydrologic analysis involves the computation of the runoff hydrograph. The hydraulic evaluation includes reservoir routing and the computation of elevation-discharge data for both the open channel and closed conduit spillways. Although this differentiation is not universal in civil engineering, it will be used in these guidelines.

Spillway design is an iterative process that involves routing the runoff hydrograph through the reservoir and a trial spillway system. The objective of this process is to design a spillway system that will safely pass the runoff from the design storm without overtopping the dam. Other objectives include designing a spillway system that is economical, dependable, and can be constructed with locally available materials.

The information in this section discusses some of the basic elements of a hydrologic and hydraulic analysis that the Project Engineer will find useful in designing or evaluating a spillway system for a dam. The methods referred to in this section are not exhaustive. Specific analytical methods should be determined on a case-by-case basis. Pre-design meetings between the engineer and the Division of Water are encouraged.

4.2 Hydrology

The design of a new spillway system and the evaluation of an existing spillway require the engineer to compute a runoff hydrograph. Parameters used in the computation of a runoff hydrograph include the watershed area, total rainfall, rainfall distribution (hyetograph), time of concentration, initial abstraction, and infiltration characteristics of the watershed.

4.2.1 Methodology

The runoff hydrograph, elevation-discharge data for the spillway system, and an appropriate reservoir storage-indication method of flood routing are used to perform an overtopping analysis of the dam. Flood routing is necessary to evaluate the adequacy of existing spillways and design new spillway systems. The overtopping analysis involves four steps: computing the runoff hydrograph, determining the elevation-discharge relationship for the spillway system (using the methods in Section 4.3), determining the elevation-storage relationship for the reservoir, and routing the runoff hydrograph through the reservoir and spillway(s). When designing

a new spillway, iterations continue until the engineer determines an acceptable top-of-dam elevation and adequate size for both the principal and emergency spillways. Because of the iterative nature of the computations, engineers frequently utilize computer programs to perform hydrologic simulations. Acceptable computer programs include the United States Department of Agriculture (NRCS) DAMS2, SITES, and TR-20 software and the United States Army Corps of Engineers (COE) HEC-1 and HEC-HMS software.

4.2.2 Hazard Classification

The hazard classification of a dam is determined by evaluating the area that would be affected by inundation in the event the dam fails with the reservoir at the emergency spillway crest elevation or the dam crest elevation, in the absence of an emergency spillway. A correlation between the amount of inundation and the hazard classification is summarized in Appendix A. In many cases, the hazard classification of a dam can be determined by a review of current topographic maps and a visual inspection of the downstream floodplain for a distance commensurate with the size of the reservoir. If a breach analysis is required, the methodology described in Section 4.10 should be used.

Over time, development occurs in the area downstream of a dam. In fact, a manmade lake sometimes encourages downstream development. It is therefore prudent for the Project Engineer to consider designing the spillway for a higher hazard classification, when appropriate. This can help the owner avoid major dam and spillway modifications at a later date when the downstream development occurs, the hazard classification increases, and costs for upgrading the dam and spillway system are higher.

4.2.3 Design Storm Events

After the hazard classification of the dam has been determined, the appropriate design storm is selected using the criteria in Table 1.

If the time of concentration (Tc) is less than 6 hours, the 6-hour Probable Maximum Precipitation (PMP) should be used to analyze the spillway system. If the Tc exceeds 6 hours, the design storm duration is increased to a time equal to or greater than the Tc. This increases the PMP depth to account for the longer storm duration. All season 6-hour, 10 square mile PMP isohyetals and 24-hour, 10 square mile PMP isohyetals for the state can be found in Appendix D and in the latest edition of the Indiana Department of Natural Resources (IDNR) - Division of Water Publication "Rainfall Frequency for Indiana." The definition of the PMP rainfall event and its computation are discussed in the Department of Commerce Hydrometeorological Report (HMR) No. 52. If the watershed is greater than 10 square miles, the PMP depth may be reduced using procedures outlined in Hydrometeorological Report (HMR) No. 51.

Table 1: Design Storm Event for Spillway Design and Analysis

Dam's Hazard Classification	Design Storm Event	Remarks
High	100% PMP	For existing dams, a smaller design storm between 50% & 100% PMP may be justified through an elaborate Incremental Hazard Evaluation procedure described in TADS module "Evaluation of Hydrologic Adequacy".[1]
Significant	50% PMP	
Low	100-Year to 50% PMP	The spillway design storm requirements may vary from the 100-Year storm (for in-channel, low head dams which will be completely inundated by the 100-year storm event) to the 50% PMP (for normal situations, where the downstream hazard is likely to increase from low to significant in the future). A smaller percentage of PMP may be accepted by the Division of Water on a case by case basis, if the consequences of dam failure can be demonstrated to be negligible or assurance in the form of a deed restriction, covenant, etc. is provided to the Division of Water prohibiting new development within the dam breach inundation zone.

NOTE: [1] Information regarding this publication may be obtained from the Division of Water . The owner and engineer should recognize that dam construction typically results in higher risks. If an Incremental Hazard Evaluation procedure is utilized, the owner should periodically evaluate the downstream area to determine if this evaluation is accurate as new development takes place. The owner may eventually be required to modify the dam and spillway to safely pass the runoff from the 100% PMP, if such analysis indicates that the earlier results are no longer valid due to new development occurring downstream.

The 6-hour PMP hyetograph is derived using the NRCS Type B distribution while the 24-hour PMP hyetograph is derived using the NRCS Type II distribution. Both distributions are shown in Appendix D. Other rainfall distributions may be used to develop the design hyetograph. The Project Engineer is encouraged to meet with the Division of Water staff to discuss the use of other methods.

4.2.4 Watershed Area

Watersheds should be delineated on USGS 7½ minute topographic maps in accordance with recognized USGS delineations in the booklet, “Drainage Areas of Indiana Streams” to determine the size, shape and relief of the area contributing runoff to the reservoir. Watersheds are divided into sub-watersheds when appropriate

(see http://in.water.usgs.gov/cdfactsheet/index.shtml) for use in delineating watershed boundaries. The engineer should consider dividing the watershed into sub-watersheds when the area above the dam is greater than 2000 acres or the sub-watersheds have significantly differing characteristics such as slope, land use, soil types, or shape.

4.2.5 Time of Concentration

There are numerous methods that can be used to compute the time of concentration. The size, shape, and geomorphology of the watershed are key factors that should be examined in detail before selecting a method. The surface runoff path should be divided into subreaches depending upon type of flow (sheet-overland, concentrated, gully, storm sewer, culver, ditch, stream, or channel), land cover, and slope. The kinematic wave method may be applied to calculate travel times from the point of entry into the lake, through the reservoir, and to the spillway outlet. Travel time calculations for each subreach should be provided and the total travel time indicated. Parameter limitations of each method should be examined before a method is selected. The following are a list of methods frequently used to compute the time of concentration:

- NRCS TR-55 Method (computes Tc directly by dividing the watershed into flow segments for both overland and channel flow; travel times for each segment are summed from the most hydraulically remote point in the watershed to the reservoir)
- NRCS Upland Method
- Kinematic Wave Method (computes Tc directly by dividing the watershed into flow segments for both overland and channel flow; travel times for each segment are summed from the most hydraulically remote point in the watershed to the spillway outlet)

Other Tc methods are acceptable. Documentation for the method used to determine the Tc should be included in the engineering report and should include the equation(s) and the design methodology (see Section 4.11).

4.2.6 Rainfall Losses

Initial abstraction and infiltration are deducted from the total rainfall to derive the runoff hydrograph. In the absence of site-specific data, lumped parameter models such as the NRCS Runoff Curve Number Method (*National Engineering Handbook*, Section 4, *Technical Release 5*, or *Engineering Field Handbook*, Chapter 2) can be used. The NRCS Runoff Curve Number Method is a methodology that determines losses and initial abstraction on the basis of soil types and land use. As a minimum, curve numbers should be determined for antecedent moisture condition (AMC) II. The engineer should consider projected land use changes in the computation of the curve number. Design documentation will include soil types, land use, maps, and the

methodology used in calculating the curve number (see Section 4.11). The COE HEC-1 and HEC-HMS programs include other loss rate methods that are acceptable.

4.2.7 Hydrographs

Because smaller watersheds in Indiana are ungaged, the use of synthetic unit hydrographs is an accepted procedure for the computation of runoff hydrographs. Synthetic unit hydrographs are based on the assumption that watersheds within a homogeneous region have similar rainfall-runoff characteristics. The NRCS dimensionless unit hydrograph is typically used and is valid for watersheds up to 50 square miles in size. Larger watersheds can be divided into sub-watersheds less than 20 square miles in size to use the NRCS method. Clark's unit hydrograph, which considers the storage effects of the watershed, and Snyder's unit hydrograph, which considers the physical geometry of the watershed, are useful for analyzing larger watersheds. Snyder's method is valid for watersheds ranging in size from 10 square miles to 10,000 square miles. Other synthetic unit hydrographs may be acceptable but should be coordinated in advance with the Division of Water.

4.2.8 Channel Routing

Large heterogeneous watersheds are frequently delineated into sub-watersheds and stream networks. Runoff hydrographs are derived for each sub-watershed and channel routed through the stream network to the reservoir. The Modified Puls Method and the Muskingum-Cunge Method are typically used to perform the channel routing. The Muskingum-Cunge Method requires knowledge of the physical characteristics of the channel, such as the reach length, cross sections and slope to compute the routing coefficients. Both methods may be used with the HEC-1 or HEC-HMS programs to derive the runoff hydrograph for the watershed.

4.3 Hydraulics

Hydraulic calculations are performed to determine the elevation-discharge characteristics of closed conduit and open channel spillways. Principles of fluid mechanics allow the engineer to analyze weir, orifice and full pipe flow in closed conduit systems, which may include inlet structures, outlet structures, gates, and valves. Open channels are typically analyzed under steady, nonuniform flow conditions to determine the location of the control section and the water surface profile. Transitions from gradually varied flow to rapidly varied flow frequently occur in open channels and the analysis should evaluate the effect of side channel entrances, ogee sections, bridges, geometric transitions, and energy dissipation structures.

4.3.1 Spillways

The design of spillways for a dam project requires consideration of numerous parameters. Among these parameters are the type, size, and location of primary and emergency spillways and the need for inlet and outlet structures. The topography and

soil conditions at a site are important considerations in the design of spillway systems. The need for energy dissipation, erosion control, debris protection measures, and maintenance procedures should be evaluated.

Typically, a dam will have at least two spillway structures, a principal (or primary) spillway and an emergency (or auxiliary) spillway. The combined capacities of the spillways should be able to safely pass the runoff from the design storm without overtopping the dam. The emergency spillway should be an engineered open channel to prevent blockage during the design flood.

Due to the high maintenance costs and the erosion potential of grassed open channel spillways, it is desirable to minimize the frequency of use of the emergency spillway. A typical approach is to design the spillway system so that the emergency spillway only operates for rainfall events greater than the 100-year event. For significant and low hazard structures, the emergency spillway should only operate for rainfall events greater than the 50-year storm.

The emergency spillway (regardless of the type) should be properly protected against erosion in order to provide structural resistance to up-lift, cavitation, vibration, and erosion. Sufficient erosion protection should be provided to prevent the uncontrolled release of reservoir storage below the emergency spillway elevation during the design flood.

4.3.1.1 Principal Spillway

The principal (or primary) spillway controls the normal pool elevation of the lake and should safely handle outflow from the lake under various conditions including freeze/thaw and ice buildup. The principal spillway usually consists of an inlet structure, a closed conduit, and an outlet structure. Ease of access for timely maintenance is especially critical. Principal spillways are frequently located within the embankment although they may be situated in natural ground. Some types of principal spillways include:

- Culvert(s)
- Drop Structures
- Gated Structures
- Labyrinth Weirs
- Morning Glory Inlets
- Ogee Weirs
- Standard Covered Risers

Public safety should be considered in the design of principal spillway inlets and outlets. Barriers should be placed on riser openings and signs posted near inlet structures to warn the public of the hazard posed by spillways.

4.3.1.2 Emergency Spillway

The emergency (or auxiliary) spillway provides additional discharge capacity as the lake level rises to prevent the dam from overtopping during the design storm. The emergency spillway also provides an alternative for safe discharge should the primary spillway become inoperable or blocked.

The outlet slope of the emergency spillway should be greater than the critical slope to cause critical depth (a hydraulic control section) to occur at the spillway crest. Backwater computations should be submitted for a wide range of discharges in order to establish a rating curve and show the depth-discharge characteristics for the entire length of the spillway. Regardless of the spillway slope, it is advisable to compute a water surface profile for the design discharge using the Corps of Engineers HEC-RAS or HEC-2 programs to estimate the maximum velocities in the channel and determine the height of erosion protection required in the spillway.

The emergency spillway is typically an open channel. It should be located in natural ground away from the dam so that during the operation of the spillway, the dam will not be endangered. When this is not feasible, adequate armor protection should be placed on the dam to allow a portion of it to act as an emergency spillway during the design storm. Emergency spillways in natural ground are typically vegetated but may need additional protection if operated frequently or if design flow velocities are excessive. Listed below are types of acceptable armor protection for emergency spillway channels:

- Articulated Blocks
- Concrete Paving
- Gabion Baskets (underlain with a properly designed filter)
- Engineered Riprap

Early coordination with the Division of Water is required when an emergency spillway will be located on the embankment.

4.3.2 Spillway Rating Curves

A rating curve (plot of elevation versus discharge) should be developed for each primary and emergency spillway structure. The rating curves should be combined into an overall rating curve for the reservoir. The engineer should evaluate how the different spillway structures will affect the overall outflow capacity and the ability of the spillway system to safely pass runoff from the design storm.

Design documentation should include the equations used to calculate each of the spillway rating curves and the design methodology. The rating curves should be

provided in tabular and graphical format (elevation-discharge tables) for each of the spillway structures and combination of all structures.

Maximum design flow velocities for the principal and emergency spillways should be computed when designing structures, outlets, and channels. An evaluation of the maximum velocities is necessary to determine if stilling basins or other outlet protection is required. The design of suitable energy dissipation measures is an important consideration for each spillway structure

4.3.2.1 Downstream Channel Conditions

Channel conditions downstream of the dam can greatly affect the discharge capacity and stability of the dam and should be considered in the overall design. In situations where there are restrictions in flow capacity downstream of the dam (due to a roadway culvert, bridge, lake, levee, or a narrow valley cross-section), the restrictions should be evaluated to determine if tailwater conditions exist at the dam and if the tailwater will reduce the capacity of the spillways.

Typical stilling basin and plunge pool energy dissipation designs require that the tailwater elevation for the channel downstream of these structures be known.

The methodology and data required for determining tailwater conditions at spillway outlets can vary depending upon the characteristics of each downstream restriction. Appropriate field data should be obtained for each downstream restriction, in order to accurately determine the resulting tailwater effects. Corps of Engineers programs HEC-RAS and HEC-2 are typically used to calculate backwater profiles for determining tailwater effects. Other methods or software may be acceptable with prior approval from the Division of Water

4.3.3 Force and Energy Considerations

The operation of spillway structures involves the discharge of significant flows for an extended period of time. In the event the forces and energy resulting from flow through the spillway structure are not considered in the selection and design of spillway structures, damage or failure of the structure may occur. This could impact the overall safety and integrity of the dam.

Structural analysis is necessary to determine the effect of momentum forces on the spillway structures during the design storm. The results of the analysis are used to design the structures to withstand these forces. Analysis and design to provide adequate energy dissipation at each spillway outlet is also necessary. Listed below are some types of energy dissipators.

4.3.3.1 Conduit Spillway Energy Dissipators

- Cantilever Plunge Pool
- Impact Basin
- Riprap Basin
- Stilling Basin (with blocks and end sill)
- Chute Blocks

4.3.3.2 Concrete Chute Spillway Energy Dissipators

- Deflector Buckets
- Hydraulic Jump Basin
- Stilling Basin

Earthen emergency spillways are subject to erosion and possible failure during the design storm. If the failure of an earthen emergency spillway could affect the safety or integrity of the dam, or pose a hazard to downstream residents and structures, spillway attack calculations should be provided. These calculations predict the likelihood that an earthen spillway will fail during the design storm based on soil resistance and bulk length. Field and laboratory data should be obtained to perform the spillway attack calculations so that the spillway can be designed to perform safely. The NRCS SITES computer program may be used to assess the erodibility of an earth spillway.

Structural analysis and geotechnical evaluations regarding spillways should be incorporated into the structural design section of the engineering report and submitted with the permit application.

4.4 Reservoir Routing Procedures

The elevation-storage characteristics of the reservoir should be determined from a hydrographic survey of the reservoir, USGS topographic maps, or maps derived from aerial photography. The elevation-storage data should be submitted in both graphical and tabular format.

After the runoff hydrograph, the elevation-storage curve, and the combined spillway-rating curve have been derived, the engineer can perform reservoir routing computations. Reservoir routing refers to the iterative process of balancing inflow volume, outflow volume, and available storage volume for incremental time periods over the duration of the design storm event in order to assess performance characteristics of the reservoir. The Modified Puls reservoir routing method is typically used to route the runoff hydrograph from the watershed through the reservoir and spillway system. Alternatives for various configurations of the dam and spillway system should be evaluated to design a cost effective principal and emergency spillway that will be dependable and safe.

4.5 Freeboard Calculations

All spillway systems must safely pass the design storm without overtopping the dam. The characteristics of the reservoir should be evaluated to determine if freeboard is required. Freeboard is defined as the distance between the maximum elevation of the reservoir during the design storm and the minimum elevation of the dam crest. In certain situations, the length and orientation of the reservoir may increase the height of waves during the design storm. These waves could overtop the dam. The engineer should determine the effects of wave action when appropriate.

On rare occasions, a dam may be designed to allow overtopping to occur during the design storm. Because of the complexity and risk involved in designing a dam to withstand overtopping, the Project Engineer should meet with the Division of Water staff early in the preliminary engineering phase to discuss specific design requirements.

4.6 Structural/Mechanical

Spillway structures, gates, valves, and appurtenant works should be designed to operate efficiently and safely handle all expected flows (normal & infrequent) and loading conditions from the dam. Spillway structures should be designed to allow maintenance and repairs to be accomplished throughout the expected life of the dam.

4.7 Filling Schedule for Reservoirs

In some cases, it may be necessary to fill the reservoir in stages to allow time for the embankment and foundation materials to adjust to the increased hydrostatic loads resulting from the reservoir. A schedule for filling the reservoir should be developed, based on the embankment and foundation performance, as determined by properly installed instrumentation and visual inspections. The following is a typical schedule for filling the reservoir:

- First 1/3 of the pool level – fill rate unrestricted
- Second 1/3 of pool level - no more than 2 feet per week
- Final 1/3 of pool level - no more than 1 foot per week

4.8 Drawdown Time

All dams should have an adequately designed drawdown structure to allow maintenance and accommodate the requirements of the Operation Plan and the Emergency Action Plan. The dam owner should consider the affects of downstream flooding during reservoir drawdown operations

Rapid drawdown situations affect the stability of the embankment and should be considered when designing the dam and lowering the pool. The rate of safe drawdown and the capacity

of the drawdown pipe should be computed by the engineer and documented in both the Operation Plan and the Emergency Action Plan.

4.9 Spillway Materials

Proper selection and design of materials for a spillway system are as important as the capacity. Metal, concrete, riprap, geosynthetics, and high-density polymers are some of the materials available for spillway structures. The anticipated loads, required operations, expected performance, life cost, and the spillway environment should be considered in the selection of spillway materials.

Materials for pipe spillways should be selected carefully. Pipe spillways are designed for pressure flow. Corrugated metal pipe (CMP) joints are not designed to be watertight in high-pressure applications and are not recommended for use in spillway systems. Welded steel pipe is acceptable in low-head applications but cathodic protection should be provided to delay the onset of corrosion. Because of construction issues, past failures, and the lack of long-term performance documentation in spillway applications, the use of polyvinyl chloride (PVC) and high-density polyethylene (HDPE) pipes are not recommended for spillway pipes. Reinforced concrete pipe (RCP) is very durable and is typically used in pipe spillways. Bell and spigot joints with rubber o-ring gaskets provide a watertight joint in most RCP applications. The use of anti-seep collars and/or seepage control diaphragms should be included in the design and construction of conduit spillways through dams.

4.10 Hazard Evaluation and Dam Break Analyses

Properly designed, constructed, and operated dams can be expected to attenuate downstream discharges during flood events. However, failure of a dam during normal conditions or during a flood event can create a potential hazard far greater than that which existed without the dam. The consequences of dam failure should be fully evaluated and analyzed in order to properly identify and define the extent of the potential "hazard zone". The results of these analyses should be used in determining the hazard classification of the dam and developing the Emergency Action Plan procedures.

4.10.1 Dam Break Analysis Methods

The degree of study required to define the impacts of potential dam failures is site specific and will vary depending upon the type and height of dam, size of reservoir, and downstream conditions. In some cases, detailed studies referred to as, "dam break" or "dam breach" analyses, will be required to determine the anticipated downstream hazard zone.

The generally accepted procedure for dam break analysis involves application of unsteady flow and dynamic routing methods. The following computer programs apply this procedure:

- DAMBRK (National Weather Service)
- FLOODWAV (National Weather Service: combines the DAMBRK model with the DWOPER model)

The Corps of Engineers HEC-1 hydrologic model may also be used to perform a dam break analysis to determine downstream inundation areas. The HEC-1 dam break simulation assumes that the reservoir pool remains level while water is released through an incrementally changing triangular, rectangular, or trapezoidal breach in the dam. The HEC-1 model can be used with a river routing scheme to delineate downstream flood zones or in conjunction with the COE HEC-RAS or HEC-2 models to simulate steady, nonuniform flow conditions in the downstream channel and floodplain. When the COE models are used, the hydrologic methods are assumed to be appropriate for the dynamic flood wave. Under most conditions, these assumptions will be approximately true and will provide results that are sufficiently accurate for the determination of the downstream hazard zone. Appropriate care is recommended in interpreting the results of a dam break analysis based on these assumptions. If a higher order of accuracy is necessary, the National Weather Service unsteady flow models should be applied.

4.10.2 Dam Break Analysis Parameters

The accepted methods for determining dam break analysis scenarios require the user to select the dam failure parameters under a variety of failure modes. Table 2 provides typical values for these parameters. The parameters include the size, shape, and time of formation of the dam breach.

The conditions during which the simulated dam breach occurs is a critical component of the analysis. A "sunny day" breach analysis implies that the dam fails as a result of structural, geotechnical or mechanical failure, not as a result of overtopping of the dam. However, it is advisable, when performing a sunny day breach analyses, to assume (at a minimum) that the reservoir pool elevation is at the emergency spillway operating elevation. In the event that the reservoir does not have an emergency spillway or other open channel spillway outflow, the reservoir elevation should be considered to be at the minimum dam crest elevation.

Simulation of a dam break during the design storm is also advisable. This analysis should be considered in situations where there is the potential that the spillway system capacity could be significantly reduced as a result of blockage, operating failure, or some other condition. This dam break scenario assumes that the failure will occur as soon as the reservoir elevation exceeds the minimum dam crest elevation. Careful consideration should be given to the amount of inflow, the reservoir elevation at failure, and the downstream water elevation. If a recent storm event has occurred, downstream conditions may still be fully saturated or at a flood level.

When analyzing a sunny-day breach or a dam break during the design storm event, the flood storage provided by downstream dams may be considered by the engineer if these dams are approved by the state and regularly inspected. If a downstream dam is not approved by the Division of Water or if an approved downstream dam is found to overtop, the water stored by the dam is assumed to be released and included in the analysis.

Table 2: Suggested Breach Parameters for Indiana

Type of Dam	Avg. Breach Width BR (feet)	Breach Side Slope Z	Time to Failure TFH (Hours)
Arch	W	Vertical or Slope of Valley Walls	0.1
Masonry; Gravity	Monolith Width	Vertical	0.1 to 0.3
Rockfill	HD	---	---
Timber Crib	HD	Vertical	0.1
Slag; Refuse	80% of W	1.0 to 2.0	0.1 to 1.0
Earthen "non-engineered"	2HD to 5HD	0.0 to 1.0	0.1
Earthen "engineered"	0.5HD to 5HD	0.0 to 1.0	0.5 to 1.0

Definitions:

BR	Average Width of Breach
HD	Height of Dam
TFH	Time of Full Formation of the Breach
W	Crest Length
Z	Horizontal Component of Side Slope of Breach

4.11 Documentation

The hydrologic and hydraulic design and analysis of a dam consists of extensive technical work. The engineering report should clearly document the programs, assumptions, parameters, equations, tables, graphs, methodology, engineering judgement, results, and recommendations that were used in the evaluation process. When computer programs are used to perform hydrologic and hydraulic computations, copies of the data files should be submitted in electronic format (floppy disk or CD). The engineering report should be submitted with the permit application to facilitate the review and approval process.

Drawings
and
Specifications

Section 5
DRAWINGS AND SPECIFICATIONS

5.1 Introduction

Every proposed dam or dam repair project requires a set of complete drawings (also referred to as plans) and specifications tailored to the project.

The drawings and specifications are based on the results of the technical evaluations (hydrologic/hydraulic, geotechnical, geologic, structural, etc.) described in the previous sections and recommendations in the engineering report. This section lists items which typically are included in a set of drawings and specifications submitted to the Division of Water. This is not intended to be an all-inclusive list, nor will all of these items be required for every project. This list is limited to aspects of the dam and appurtenant structures. Other items such as an erosion control plan and a plan addressing archeological and cultural resources may need to be submitted for review by others. Some of the items in this section may be combined for clarity or simplicity.

Selected plan sheets for an example dam have been included in Appendix E to illustrate the level of detail and completeness required for small to medium size dams. In Appendix F is a list of the Common Pitfalls that render plans and specifications incomplete.

5.2 Construction Drawings Guidelines

It is recommended that drawings be submitted on 24” X 36” sheets.

5.2.1 Title Sheet

- 5.2.1.1 Location map with North arrow and scale
- 5.2.1.2 List of drawings
- 5.2.1.3 Twenty-four (24) hour contact and phone number
- 5.2.1.4 Owner's name, address, and phone number
- 5.2.1.5 Engineer's name, address, and phone number
- 5.2.1.6 Engineer's professional seal
- 5.2.1.7 Legend & Information

5.2.2 Regional Plan

- 5.2.2.1 Regional features that the contractor should be aware of during construction (i.e. drainage area, upstream dams, etc.)
- 5.2.2.2 Location of proposed lake and dam
- 5.2.2.3 Downstream hazards (buildings, road, etc.) potentially impacted by dam breach

5.2.3 Vicinity Plan

5.2.3.1 Excavation within the area upstream from the toe of the dam should be based on safety considerations. The Project Engineer usually determines the limits of excavation.
5.2.3.2 Disturbance limits
5.2.3.3 Existing topography
- source (aerial, ground survey, data source)

5.2.3.4 Existing features
5.2.3.5 Borrow/spoil areas
5.2.3.6 Property/easement limits and owners/easement holders
5.2.3.7 North arrow and scale
5.2.3.8 Demolition

5.2.4 Site Plan

5.2.4.1 Site grading
5.2.4.2 Existing topography
- source (i.e. aerial, ground-run, data source)
- contour interval 2-5 ft suggested.

5.2.4.3 Existing features
5.2.4.4 Borrow/spoil areas
5.2.4.5 Disturbance limits
- should be based on safety considerations.

5.2.4.6 Property/easement limits and owners/easement holders
5.2.4.7 Proposed structures, spillways and features
5.2.4.8 Demolition
5.2.4.9 North arrow and scale
5.2.4.10 Geotechnical exploration locations
5.2.4.11 Survey control points

5.2.5 Profiles and Sections

5.2.5.1 Dam centerline profile
- subsurface soils/rock borings
- crest profile (showing compensation for settlement)
- seepage collection and drainage features

5.2.5.2 Dam cross sections
- foundation preparation
- embankment zoning
- upstream and downstream slopes
- seepage collection and drainage features
- cut off trench
- roadway on crest

5.2.5.3 Emergency spillway profile
- typical section
- cross sections
- training berm profile

5.2.5.4 Principal spillway profile
- conduit camber
- anti-seep collar
- seepage control diaphragm

5.2.5.5 Seepage reduction
- clay blanket
- keyway
- slurry wall
- grout curtain
- other relevant items

5.2.6 Seepage Collection

5.2.6.1 Drain Types
- chimney drains
- blanket drains
- trench drains
- toe drains
- foundation drains
- filter collar drains
- rock toes
- other

5.2.6.2 Drain Plans

5.2.6.3 Drain Profiles and Sections

5.2.6.4 Drain Details
- outlet headwalls
- cleanouts
- collection pipe
- animal guards

5.2.7 Instrumentation Plan

5.2.7.1 Settlement plate locations

5.2.7.2 Piezometer locations

5.2.7.3 Instrumentation details (as needed)

5.2.7.4 Installation details (as needed)

5.2.8 Structural Plans

5.2.8.1 General Plans

5.2.8.2 Structural sections and details

5.2.8.3 Waterstop details

5.2.8.4 Concrete joint details and locations

5.2.8.5 Trash rack details
5.2.8.6 Spillway slab
- underdrains
- anti-cavitation details

5.2.8.7 Outlet pipe and concrete cradle details
- filter collar

5.2.8.8 Intake structure details
5.2.8.9 Retaining wall
- foundation
- wall drain

5.2.8.10 Lake drawdown pipe

5.2.9 Miscellaneous Details

5.2.9.1 Shoreline wave protection
5.2.9.2 Internal drainage outlet
5.2.9.3 Plunge pool details
5.2.9.4 Rip-rap details
- limits
- thickness
- type
- bedding
- geotextile

5.2.9.5 Gates & Valves
5.2.9.6 Pavement Details

5.3 Construction Specification Guidelines

5.3.1 Site Preparation

5.3.1.1 Reservoir clearing
5.3.1.2 Clearing and grubbing
5.3.1.3 Waste disposal
5.3.1.4 Stripping
5.3.1.5 Demolition

5.3.2 Dewatering and Diversion

5.3.2.1 Diversion of water
5.3.2.2 Removal of water

5.3.3. Earthwork

5.3.3.1 Undercutting
5.3.3.2 Excavation

5.3.3.3 Rock removal
5.3.3.4 Borrow area development
5.3.3.5 Fill material placement
- Compaction

5.3.3.6 Backfilling
5.3.3.7 Rock fill

5.3.4 Foundation Treatment

5.3.4.1 Drilling and pressure grouting
5.3.4.2 Slurry trench
5.3.4.3 Keyways
5.3.4.4 Treatment of rock surface
5.3.4.5 Rock anchors

5.3.5 Conduits

5.3.5.1 Reinforced concrete pressure pipe
5.3.5.2 Reinforced concrete pipe
5.3.5.3 Steel pipe
5.3.5.4 Ductile iron pipe
5.3.5.5 PVC siphon pipe
5.3.5.6 HDPE pipe

5.3.6 Seepage Collection Systems

5.3.6.1 Toe drains
5.3.6.2 Blanket drains
5.3.6.3 Chimney drains
5.3.6.4 Trench drains
5.3.6.5 Foundation drains
5.3.6.6 Filter collars
5.3.6.7 PVC drain pipe
5.3.6.8 Aggregates
5.3.6.9 Geotextiles

5.3.7 Erosion Protection

5.3.7.1 Rip-rap
5.3.7.2 Geotextiles
5.3.7.3 Other
5.3.7.4 Articulated block

5.3.8 Grassing and Vegetation

5.3.8.1 Soil preparation
5.3.8.2 Seeding
5.3.8.3 Mulching

5.3.9 Fencing

5.3.9.1 Fence
5.3.9.2 Gates

5.3.10 Instrumentation

5.3.11 Concrete

5.3.11.1 Formwork
5.3.11.2 Reinforcement
5.3.11.3 Accessories
5.3.11.4 Cast-in-place concrete
5.3.11.5 Precast concrete
5.3.11.6 Roller compacted concrete
5.3.11.7 Waterstops
5.3.11.8 Joint material

5.3.12 Metals

5.3.12.1 Trash rack
5.3.12.2 Structural steel
5.3.12.3 Miscellaneous metals
5.3.12.4 Anchor bolts
5.3.12.5 Handrails

5.3.13 Equipment

5.3.13.1 Sluice gate
5.3.13.2 Valves
5.3.13.3 Weirs
5.3.13.4 Other

Construction Monitoring

Section 6
CONSTRUCTION MONITORING

6.1 Introduction

The best embankment and spillway design can turn out to be a failure without proper construction monitoring. It is critical that the Project Engineer adequately monitor the construction of the dam and the initial filling of the reservoir. It is also important to monitor the performance of the dam following the completion of construction.

6.1.1 Construction Versus Post Construction

The monitoring program for the construction of a new dam, or the remediation of an existing dam, includes both the actual construction work and the initial reservoir filling (refilling). This section of the guidelines deals primarily with the actual construction period.

6.1.2 Project Engineer and other Technical Professionals

The Project Engineer should work closely with the owner and remain involved with the project during construction. As the owner's representative, the Project Engineer should make regular visits to the site. For large projects, the Project Engineer may designate a field engineer to remain on site and monitor all construction work. In most instances, a geotechnical engineer will be actively involved with the project for the design firm, or as a subconsultant to the design firm. The geotechnical engineer will perform many of the construction monitoring activities. A senior geotechnical technician may be assigned to deal with many of the routine aspects of construction such as monitoring clearing and grubbing activities, monitoring foundation preparation, and performing compaction testing, concrete testing, and gradation tests of the filter and drain material. In addition, other engineering disciplines may be involved in project management and structural evaluations.

6.1.3 Level of Involvement

For large projects, the construction operations should be monitored on a full-time basis. The appropriate design engineer should monitor the construction work that will remain part of the completed project. Many of the construction activities require meeting not only minimum performance requirements, but also observing the details of the actual construction. For example, monitoring the earthwork requires more than density testing which provides only an indication of the degree of compaction and the in place moisture content of the fill material. It is important to monitor the placement of the materials in the dam to make sure lift surfaces are properly prepared and material is placed in the zones depicted on the design plans. This can only be determined by full-time observation of the construction activities.

6.1.4 Need for Technical Professional Involvement

Design activities continue through the construction phase. Interpretations of subsurface data, constructability issues, and modifications necessitated by the contractor's experience and equipment mandate that representatives of the design team remain involved throughout the construction process. These individuals are most familiar with the design assumptions and are in the best position to recommend appropriate modifications, if needed.

6.1.5 Adherence to Plans and Specifications

The primary function of the construction monitoring team is to verify that the contractor complies with the approved plans and specifications.

6.1.6 Design Changes/Field Conditions

Situations occasionally occur where the design will need to be altered due to unforeseen field conditions. The Project Engineer can help facilitate a quick resolution to these situations. Changes that are significant will need to be reviewed and approved by the Division of Water prior to the change being implemented. Minor modifications should be reported and documented on the as-built drawings.

6.1.7 Certification

Almost all permits on dams include a condition that requires the applicant to submit as-built plans certified by a professional engineer. The Project Engineer needs to be closely involved in the construction activities to be able to provide such a certification.

6.2 Routine Construction Monitoring Reports

The following is a brief listing of several of the aspects of construction monitoring that typically need to be performed. This should not be considered an all-inclusive list and should be amended or expanded to account for the particular dam being built. Ideally, all aspects of the construction phase should be monitored and reported.

6.2.1 Clearing and Grubbing

The Project Engineer should evaluate the site after the contractor has completed the clearing and grubbing operations to determine that adequate procedures have been followed to allow for subsequent construction. This monitoring should be reported in a daily inspection report.

6.2.2 Subgrade

The Project Engineer should monitor the subgrade and foundation preparation for the dam. This involves items such as stripping, undercutting of unsuitable material (particularly flood plain undercutting), and keyway/cutoff construction. The conditions observed, including items such as depths of excavation and quantities should be documented in the daily field reports. The geotechnical engineer should approve all subgrade areas before fill placement occurs.

6.2.3 Drains

The Project Engineer should monitor all aspects of the internal drain system construction. The internal drainage system may include a number of components such as foundation drains, blanket drains, chimney drains, and collections systems. Since these systems are filtered either with natural materials or synthetic materials, the monitoring should assure that all filters completely enclose more pervious materials, and that the drains extend into the desired material for the proper control of the phreatic surface. Field adjustments to the drain construction are common and should be documented in daily monitoring reports.

6.2.4 Outlet Works

The Project Engineer should monitor the construction of spillway and drawdown pipes, and their associated intake and outlet structures. Intake control structures typically require assessment of allowable bearing capacity and adequate subgrade preparation. Outlet structures commonly incorporate some underdrainage. Conduit alignments may include concrete anti-seepage cradles, as well as filtered seepage collars. The engineer should monitor the configuration of excavations for conduits, and closely assess all backfilling procedures adjacent to this critical area of the dam. Density tests and concrete tests should be conducted and reported. The geotechnical engineer should approve all subgrades for cradles and structures for subsequent construction.

6.2.5 Earthwork

The geotechnical engineer or a qualified representative should monitor all aspects of the earthwork operations on a full time basis. Routine density testing and moisture control should be reported. In addition, the construction techniques utilized by the contractor should be reported and evaluated to assure conformance with the project specifications. The engineer's representatives should verify that all materials placed in the embankment are suitable for their intended use and that proper lift treatment is performed by the contractor to assure adequate bonding of the individual lifts. The engineer's representatives will determine if moisture adjustments are needed at the fill pad prior to fill placement. This may include either wetting or drying the borrow material to achieve suitable moisture content. The engineer's representatives should

assure that the contractor is using appropriate equipment in the grading activities. Reporting would typically include daily inspection reports summarizing the grading activities and the individual density test report.

6.2.6 Instrumentation

The details of the instrumentation program are outlined in Appendix C. Instrumentation may be placed during the construction process or at the completion of the general embankment construction. In many instances, instrumentation will include devices that are intended to be read during the construction process. For example, settlement plates or devices placed at the base of the dam are typically read throughout the construction process. The engineer should observe the installation of all instrumentation, and evaluate data collected during construction. The data should be compared to design projections to determine if any modifications or further assessments are needed.

6.2.7 Construction Photographs

It is considered good practice to take photographs or video recordings of critical aspects of the construction. These may be in the form of regularly scheduled photographs of the work progress, or specific photographs of certain aspects of the construction. The intent is to obtain a permanent record should any difficulties arise during initial reservoir filling or during subsequent operation of the dam. Photographs should be adequately labeled and dated, and are typically maintained in the design engineer's file. In certain instances, copies should be provided to the Division of Water to document unusual situations.

6.3 Special Construction Monitoring Reports

There may be situations where special construction monitoring is needed and the collection and presentation of information is required. Guidelines are presented in Appendix G. In applying these guidelines, the Project Engineer should use good judgement and elaborate upon them as required by the particular geologic/foundation setting and engineering requirements. These guidelines are not intended to be exhaustive and include all items contained in a special report. However, they do provide guidance to formulate a data acquisition program for planning and documenting specialized work.

6.4 Post Construction Monitoring

The purpose of the post construction monitoring program is to provide information regarding the behavior of the constructed or rehabilitated dam. This information is used in conjunction with as-built drawings and construction photographs to evaluate the performance of the newly constructed dam and to compare to historical data for an existing dam. The recorded data is compared to design assumptions for the dam in order to monitor lake filling and provide a means for future monitoring, operations, and maintenance.

6.4.1 As-Built Drawings

A set of as-built drawings should be submitted to the Division of Water following completion of construction and within the time limits specified in the permit. The as-built drawings should include, as a minimum, the following:

6.4.1.1 Approved Modifications - All previously approved design and construction modifications should be incorporated into the final document.

6.4.1.2 Monitoring Program - A monitoring and instrumentation program should be described if one is required.

6.4.1.3 Acceptance Criteria - A list of critical design assumptions and expected behaviors that need to be validated initially and long term should be included.

6.4.1.4 Instrumentation Locations - The location of all post construction monitoring instrumentation should be shown on the as-built site plan.

6.4.1.5 Certification - A written certification from the Project Engineer that the dam was constructed as shown on the as-built plans.

6.4.2 Lake Level

After approval by the Project Engineer, the reservoir drawdown valve may be closed and the process of filling the lake may commence. Adherence to the reservoir-filling schedule should be controlled by operation of the outlet works in order to maintain the differential rise in Lake Level and maintain flow (see Section 4.7). In the event that sudden changes occur which may be indicative of a potential dam failure, the lake level should be lowered and the Division of Water notified immediately. Otherwise, after the lake reaches the normal operating level, the approved maintenance, inspection and operation plan should be initiated.

6.4.3 Physical Condition of Dam

Areas of potential weakness and their effects on dam stability should be identified. Visual observations should be made in conjunction with instrumentation monitoring to adequately assess the safety of the dam. Initial surveillance of the dam's performance should be conducted by the Project Engineer to confirm design assumptions and to evaluate performance. Many unusual or abnormal conditions can be identified by a walking tour of the dam crest, slopes, toe, and abutments. Long-term inspection, operation, and maintenance will be the responsibility of the dam owner.

6.4.4 Instrumentation Readings

Readings that are commonly monitored at a dam site include headwater and tailwater levels, porewater and uplift pressures, crack or joint movement, structural movement, deformation, seepage flow rates, stress and strain of structural members, temperature, and seismic loads. A monitoring and instrumentation program that assigns responsibility to the engineer for data collection, reduction, presentation, and transmittal to Division of Water staff may need to be developed and documented. The program should include the reasons for installation, frequency of monitoring, threshold ranges of instruments, installation logs, calibration data, and initial readings.

All data should be compared with design assumptions for the expected behavior of the dam. If no unusual behavior or evidence of problems is detected, the readings should be maintained for future reference. Threshold readings that indicate the development of potentially hazardous conditions should be established. Action should be taken if the data deviates from expected behavior or approaches the threshold readings, depending on the nature of the potential hazard. Possible actions include:

- Performing detailed visual inspection
- Repeating measurements to confirm behavior
- Notifying the owner's engineer and the Division of Water
- Increasing frequency of measurements
- Designing and constructing remedial measures
- Installing additional instrumentation
- Operating the reservoir at a lower level
- Implementing emergency measures

6.4.5 Photographs

Photographs or videos are useful in documenting the initial site investigation, subsurface excavation, construction, and as-built conditions. They are helpful for providing a historical perspective in evaluating whether or not there has been any change from previous conditions. Photographs and videos should be maintained for future reference in the event remedial or emergency action is required.

Appendix A
Hazard Classification

Revised - February 2010

Rule 3 - Hazard Classification

312 IAC 10.5-3-1 Consideration of hazard classification

Authority: IC 14-27-7.5-8

Affected: IC 14-27-7.5

Sec. 1 (a) The division shall assign whether a dam is classified as:

(1) high hazard;

(2) significant hazard; or

(3) low hazard;

based on best information available.

(b) In making the determination of assignment under subsection (a), the division shall apply existing U.S. Army Corps of Engineers Phase 1 reports and other appropriate documentation.

(c) The division may also consider observations of the dam and the vicinity of the dam, including the risk posed to human life and property if the dam fails.

(1) If an uncontrolled release of the structure's contents due to a failure of the structure may result in any of the following, the dam shall be considered high hazard:

(A) The loss of human life.

(B) Serious damage to:

(i) homes;

(ii) industrial and commercial buildings; or

(iii) public utilities.

(C) Interruption of service for more than one (1) day on any of the following:

(i) A county road, state two-lane highway, or U.S. highway serving as the only access to a community.

(ii) A multilane divided state or U.S. highway, including an interstate highway.

(D) Interruption of service for more than one (1) day on an operating railroad.

(E) Interruption of service to an interstate or intrastate utility, power or communication line serving a town, community, or significant military and commercial facility, in which disruption of power and communication would adversely affect the economy, safety, and general well-being of the area for more than one (1) day.

(2) If an uncontrolled release of the structure's contents due to a failure of the structure may result in any of the following, the dam shall be considered significant hazard:

(A) Damage to isolated homes.

(B) Interruption of service for not more than one (1) day on any of the following:

(i) A county road, state two-lane highway, or U.S. highway serving as the only access to a community.

(ii) A multilane divided state or U.S. highway, including an interstate highway.

(C) Interruption of service for not more than one (1) day on an operating railroad.

(D) Damage to important utilities where service would be interrupted for not more than one (1) day, but either of the following may occur:

(i) Buried lines can be exposed by erosion.

(ii) Towers, poles, and aboveground lines can be damaged by undermining or debris loading.

(3) If an uncontrolled release of the structure's contents due to a failure of the structure does not result in any of the items given in subdivision (1) or (2) and damage is limited to either farm buildings, agricultural land, or local roads, the dam shall be classified as low hazard.

(d) The division may modify an assignment of hazard classification, made previously under this article, if changes in the downstream development affect the potential for loss of human life and property. (Natural Resources Commission; 312 IAC 10.5-3-1; filed Jan 26, 2007, 10:45 a.m.: 20070221-IR-312060092FRA)

312 IAC 10.5-3-2 Reconsideration of hazard classification

Authority: IC 14-27-7.5-8

Affected: IC 14-27-7.5

Sec. 2 (a) This section establishes a process by which a dam owner or another affected person may request reconsideration of a determination of hazard classification made under section 1 of this rule.

(b) The dam owner or other affected person may submit any technical information or reports that were not previously available to the division.

(c) The dam owner's or other affected person's professional engineer may develop and submit a maximum breach inundation area and current damage evaluation assessing the downstream area affected by a dam breach.

(1) If the maximum breach inundation area and current damage evaluation predicts any of the following, the dam shall be classified as high hazard:

(A) Flood depths greater than one (1) foot in any occupied quarters.

(B) Loss of human life may occur.

(C) Interruption of service for more than one (1) day on any of the following:

(i) A county road, state two-lane highway, or U.S. highway serving as the only access to a community.

(ii) A multilane divided state or U.S. highway, including an interstate highway.

(D) Interruption of service for more than one (1) day on an operating railroad.

(E) Damage to any occupied quarters where the flow velocity at the building compromises the integrity of the structure for human occupation.

(F) Interruption of service to an interstate or intrastate, utility, power or communication line serving a town, community, or significant military and commercial facility, in which disruption of power and communication would adversely affect the economy, safety, and general well-being of the area for more than one (1) day.

(2) If the maximum breach inundation area and current damage evaluation predicts any of the following, the dam shall be classified as significant hazard:

(A) Interruption of service for not more than one (1) day on any of the following:

(i) A county road, state two-lane highway, or U.S. highway serving as the only access to a community.

(ii) A multilane divided state or U.S. highway, including an interstate highway.

(B) Interruption of service for not more than one (1) day on an operating railroad.

(C) Damage to any occupied quarters that would not render the structure unusable.

(D) Damage to important utilities where service would be interrupted for not more than one (1) day, but either of the following may occur:

(i) Buried lines can be exposed by erosion.

(ii) Towers, poles, and aboveground lines can be damaged by undermining or debris loading.

(3) If the maximum breach inundation area and current damage evaluation results predict none of the items in subdivision (1) or (2) and damage is limited to farm buildings, agricultural land, or local roads, the dam shall be classified as low hazard.

(Natural Resources Commission; 312 IAC 10.5-3-2; filed Jan 26, 2007, 10:45 a.m.: 20070221-IR-312060092FRA)

Appendix C
Geotechnical Addendum-Insitu/Field Testing

A. Geotechnical Addendum - Insitu/Field Testing

1. Field Permeability Tests

Field permeability tests are generally considered to be more representative of the hydraulic conductivity of foundation materials and existing embankment materials than are laboratory permeability tests. The field testing techniques may be the only practical means of establishing foundation permeability for certain material types.

Foundation Soil - The in-situ permeability of potential foundation materials may be determined by performing field permeability tests. Selected zones of the foundation profile including alluvial materials, which may be allowed to remain in place, residual foundation soils, and partially weathered rock, are conducive to this technique. The monitoring wells that may have been installed to better establish the ambient groundwater conditions typically can be used for the field permeability test. Bailing or slug tests are typical. Pumping tests or inflow tests may be appropriate where higher permeabilities exist. Monitoring wells should be carefully constructed to assure that the zone of material desired for testing has been isolated within the screened sections of the well by appropriate seals such as bentonite and grout. The field testing technique is generally considered to provide the horizontal permeability values directly, without the need for adjusting vertical laboratory permeability test results. In addition, a broader cross-section of the subsurface profile can be tested by this technique. Care should be exercised in higher permeability situations to assure that the values being measured do not represent the actual well materials involved in the well construction. These field techniques are typically only applicable to zones of material below existing groundwater levels. Therefore, laboratory-testing techniques are generally required for materials above the groundwater level so that saturation of the material can be established prior to testing.

Existing Embankment Fill Materials - Techniques utilized for the foundation soils can be considered for determining permeability values of existing dam embankment fill materials. This procedure is generally only applicable to the materials that exist below the currently established phreatic surface through the dam. Therefore, the existing reservoir would need to be impounded at the time of testing. This technique is generally not applicable where the lake has been temporarily drained.

Foundation Rock - Packer permeability tests are typically performed to determine the hydraulic conductivity of foundation rock. Either single or double packers are commonly employed to help isolate specific zones within the foundation rock profile. In most instances, fractures and discontinuities within the rock control the hydraulic conductivity of the material. However, the test results are commonly expressed as an equivalent permeability over the length of the test section. Relatively short test sections may be employed to help isolate higher permeability zones. As with the monitoring well type permeability tests, care should be exercised to assure that the hydraulic conductivity values being determined do not represent the hydraulic limitations of the packer test equipment.

2. Other Field Tests

Strength Testing - Various field testing techniques may be considered where soft or low consistency foundation materials exist that cannot be accurately modeled by Standard Penetration Testing or undisturbed sampling. The vane shear test is commonly employed in very soft cohesive deposits. Pressuremeter or dilatometer testing may be considered for a broad range of material types and consistencies. Cone penetrometer soundings may also be considered. To some extent, these field testing techniques have evolved as preferable in certain locations and certain geologic settings. These techniques normally would only be considered where direct support of a new embankment on very weak materials is being considered, or to supplement laboratory testing in materials that are difficult to sample.

Geophysical Methods - A variety of geophysical testing techniques are available and may be considered in certain applications. These approaches would typically be applicable to a very limited number of dam projects due to the specialized nature. The most common technique is the shallow seismic refraction survey, which can be useful in profiling difficult excavation materials. The seismic refraction survey would likely have most applicability in a dam study to generally screen potential borrow areas, since this technique can be negatively impacted by existing groundwater conditions. This typically provides a relatively low cost and expedient technique that generally does not require an invasive approach similar to test pits or borings.

Other Tests - Other field testing techniques may be considered for certain specialized applications. One possible test that would fit into this category would be tracer dye testing. This is used principally to determine the flow direction and rate of flow in karst geology.

B. Geotechnical Addendum - Instrumentation

1. Piezometric Levels

The monitoring of piezometric levels may be an important consideration for specific zones within the foundation of a dam during construction and fill placement, and to evaluate the development of the phreatic surface within the embankment during and subsequent to initial reservoir filling.

Locations - Piezometric levels may require monitoring within specific zones of embankment foundations, particularly where extensive low consistency fine grained materials exist or where there are concerns over the development of high pore pressures during embankment construction (end-of-construction stability). In such instances, the monitoring device will typically measure piezometric levels at specific locations. It is typically desirable to measure piezometric levels within the completed embankment as the reservoir fills and steady-state seepage conditions develop. Devices for this purpose typically require a broad vertical zone be monitored as the piezometric levels rise within the embankment. Piezometer locations in the foundation should be concentrated in the flood plain portion of the embankment footprint. Piezometric levels within the embankment will require devices placed at both edges of the crest, at or slightly beyond the downstream toe of the dam, and potentially within the downstream slope, particularly if berms are utilized on taller structures. These devices should be aligned to allow the phreatic surface development to be plotted. Multiple stations

of such instrumentation may be needed on longer embankments.

Observation Wells - Observation wells and open (Casagrande) piezometers may be considered for many applications. These are typically well suited to monitoring the performance of foundations outside the embankment footprint during construction and within the embankment during initial reservoir filling. Short-screened sections are typically utilized for foundation monitoring. Longer screened sections can be utilized to monitor the unconfined phreatic surface within the embankment during initial filling. The observation wells are usually installed within the embankment after the fill is topped out.

Remote Reading Piezometers - These types of piezometers are well suited to monitoring foundation conditions during and subsequent to construction. Both pneumatic and electric vibrating wire type piezometers have been utilized for this purpose. They may be installed in the foundation of a dam prior to embankment construction, with tubing and wires placed in a manner that does not obstruct the subsequent construction. Remote readout locations outside the embankment footprint are typically utilized.

2. Settlement

The settlement performance of a dam and foundation is typically a consideration during and immediately following embankment construction. A typical scenario is a relatively thick compressible zone in the foundation of the proposed dam and settlement estimates performed during design indicate that significant settlements may occur.

Location - The settlement devices should target more compressible foundation zones, particularly in the vicinity of structures such as conduits. This would normally dictate a location within the flood plain area of the dam footprint. The settlement devices are often concentrated along the centerline; however, they may be placed in other areas.

Settlement Plates - Conventional settlement plates with riser pipes are the simplest forms of settlement monitoring device for the foundation. These are generally placed after foundation preparation is completed and immediately prior to commencement of embankment construction. Accurate elevations are obtained periodically during construction. These elevations should be referenced to the project datum. Additional readings are required immediately prior to and subsequent to adding additional sections of riser rod. These devices will create an obstruction to the earthmoving equipment during construction.

Remote Reading Settlement Transducers - Both pneumatic and electric vibrating wire settlement transducers may be considered. These are typically placed at strategic locations with the cables and tubing routed outside the embankment footprint to a stationary readout location. Such devices lessen the obstructions that exist during earthwork, but may not be as reliable.

Surface Monuments - Surface-monitoring points for settlement measurement should be installed immediately after topping out the embankment. These would be placed along the crest of the dam, and be adequately protected.

3. Seepage

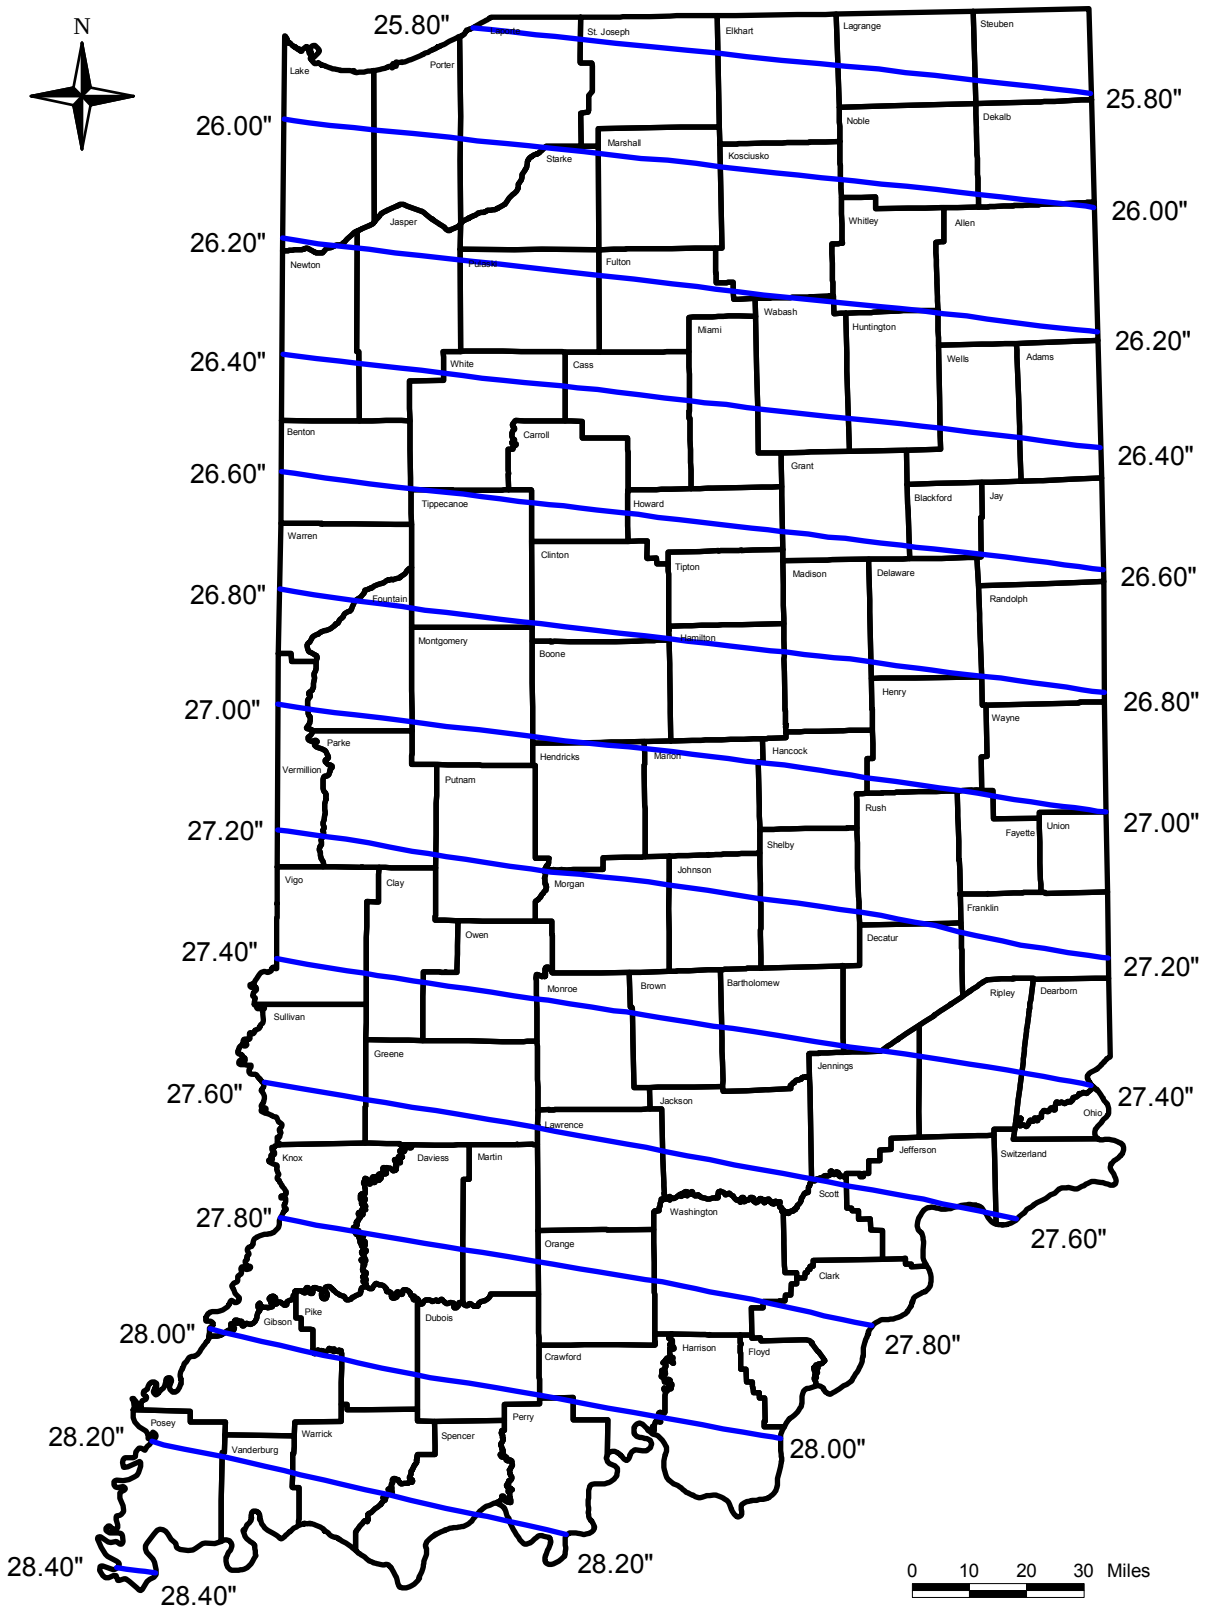
The monitoring of seepage quantities during initial reservoir filling, and throughout the subsequent life of the structure, provides useful information on the performance of the dam. This monitoring is typically facilitated by measuring the outflows from the internal drainage system components.

Piped Outlets - Piped internal drainage system components are common. The outlet location should be protected through the use of headwalls, riprap, etc. The exposed portions of the piping system should be durable, and include animal guards. Pipes should also be placed to allow routine measurement of flow. This typically requires that the invert of the pipe be placed at least a foot above the local subgrade level.

Relief Wells - Relief wells into the foundation are utilized on certain projects, particularly for gravity dams. These should be placed to allow for easy monitoring of the outflows and such that they are protected from damage.

Weirs - Seepage monitoring weirs may be considered in applications where seepage outflows exit from non-point sources, such as rock toe drains. The collected seepage should be routed into a small pool upstream of the weir, and sufficient fall should be provided to allow the V-notch weir to perform as intended. Staff gauges are typically required to determine the level of the water in the pool upstream of the weir in conjunction with seepage quantity calculations.

4. Other Instrumentation



Additional types of instrumentation may be considered in certain special applications. The engineer should determine if specific project requirements dictate the need for specialized instrumentation.

Inclinometers - These devices may be installed in situations where measurement of horizontal movements is required. A fairly common application would be on an existing dam where concerns exist over slope instability.

Crack Monitoring - Crack-monitoring devices may be needed on appurtenant structures, or to evaluate movements across discontinuities of concrete gravity dam sections.

Appendix F
Common Pitfalls

Common Pitfalls

The following is a listing of shortcomings that have been noted during the application and design review process. These are offered as an aid to ensure consideration has been given to all aspects of the design. Every item will not apply to each project.

- Not incorporating the geotechnical findings and recommendations into the plans and specifications.
- Not allowing the geotechnical contractor to review the final plans & specifications before submission
- Not providing a low level outlet for emptying the reservoir.
- Not providing a low level outlet large enough to drain the reservoir in a timely fashion.
- Not encasing or cradling the outlet pipe in concrete through the dam embankment (i.e. not eliminating the seepage path along the pipe).
- Pressurizing the outlet pipe by regulating the flow at the downstream end.
- Insufficient energy dissipation in the spillway
- Inadequate joints details for the concrete spillway slabs.
- Incompatible materials in the filter drains.
- Inadequate provision for differential settlement.
- Insufficient drainage and filters to control seepage through the dam and foundation.
- Inadequate shaping and preparation of the foundation for placement of fill materials.
- Not sloping the crest towards the upstream slope.
- Earthen spillways activating prior to the 50-year storm.
- Improper usage of filter fabric.
- Use of filter fabric for separation of coarse and fine aggregate.
- No animal guards on the toe drains.
- Not providing protection for any exposed PVC from UV radiation and vandalism.
- Improper conduit selection.
- Allowing blasting to take place in the vicinity of the dam without appropriate precautions.
- Not grouting abandoned boreholes used to evaluate existing dam that is currently impounding water.
- Not addressing instrumentation needs for monitoring during filling and normal operation, and other monitoring such as settlement during the construction process.
- Not providing adequate drop and/or projection of drain outlet pipes to allow for collection of seepage flows during monitoring and normal operation.
- Not addressing the need to ensure bonding between lifts of fill.
- Lack of adequate earthwork moisture control.
- Not providing berms on the downstream slope at appropriate intervals.
- No erosion protection at the abutment contacts (groins).
- Not providing for clearing 50 feet beyond the downstream toe of the dam.
- Not providing cleanouts on the interval drainage system.
- Not addressing seepage along the spillway conduits.
- Inadequate freeboard.
- Not addressing seismic stability issues including the riser structure.
- Not addressing the impact of utilities in the vicinity of dam.

- Using inadequate vegetation on the dam.
- Inadequate or no trash rack.
- Inadequate consideration of the impact of excavation within reservoir pool with respect to seepage control.
- Not evaluating the proposed dam over abandon coal mine areas.
- Not providing adequate erosion control prior to the establishment of a gravel ground cover.
- Not submitting as-built plans to the Division of Water.
- Allowing discharge from the emergency spillway to erode the toe of the downstream slope.
- Lack of consistency between plan sheets and supporting technical data (i.e. elevation and slope discrepancies).

Appendix G
Special Construction Monitoring Reports

A. Special Construction Monitoring Reports

1. Pressure Testing of Conduits

All conduits through the embankment should be pressure tested in accordance with the applicable ASTM and/or ANSI/AWWA Specification. A continuous record should be kept of all such tests and the information submitted for review should contain the following data:

Equipment - Equipment to perform the test.

Pressure and Duration - Specified testing pressure and minimum test periods.

Acceptance Criteria - Acceptable leakage criteria for test.

Records - A copy of the continuous record of the test and any re-tests.

2. Laboratory Material Certification

All drain and filter materials obtained from an off-site source should be regularly checked for compliance with the project specifications. Documentation should be provided that the materials supplied for placement in the dam meet the required gradation limits. Such documentation should include a certified copy of the suppliers' gradation tests. Synthetic filter material should be clearly marked for identification and include the manufacturer's certification number actually shipped to the job site.

3. Grouting

Evidence should be submitted that an acceptable grout curtain was constructed within the foundation of the proposed dam structure. To satisfy these requirements the report should contain the following information:

Drilling Equipment - Equipment that was used to drill the exploratory and grout holes.

Grout Equipment - Equipment that was used to mix the ingredients of the grout and pump the slurry down the holes.

Laboratory Equipment - Laboratory equipment that was used for on-site control tests.

Grout Mix Criteria - Specified performance values/properties of grout mix (es).

Trial Mixes - The results of any tests and trials that were made on a variety of grout mixes prior to the main grouting operation.

Design Mixes - The grout design mix(es).

Water Testing - The results of all water pressure tests in exploratory or grout holes.

Field Test Results - The results of all field tests conducted on each of the grout mixes during the grouting program with identification of non-compliant results and remedial action. Field tests should include, but not be limited to, sedimentation, slurry density, Marsh Funnel viscosity and unconfined compressive strength.

Profile - A longitudinal profile of the grout curtain showing drilling depths and grout takes for each stage of the grout holes.

4. Slurry Wall

Evidence should be submitted that a relatively impervious slurry trench cutoff was successfully installed within the foundation of the proposed dam. To satisfy these requirements, the report should contain the following information.

Excavation Equipment - Equipment that was used for construction of the working platform and for trenching.

Slurry Equipment - Equipment that was used for mixing the slurry.

Backfill Equipment - Equipment that was used for mixing and placing the backfill.

Test Equipment - Equipment that was used for the control tests.

Backfill Mix Design - Slurry backfill mix design.

Acceptance Criteria - Specified performance values/properties of slurry and backfill mix.

Field Test Results - Results of control tests, with identification of non-compliance results and remedial actions. Control tests on the slurry should include, but not be limited to, pH, unit weight, filtrate loss and viscosity. Control tests on the backfill shall include, but not be limited to, permeability, Atterburg Limits, slump, percentage passing the No. 200 sieve, water content, bentonite content and unit weight.

Profile - A longitudinal profile of the slurry wall showing excavation depths, materials excavated and backfill placed.

5. Blast Monitoring

It is assumed that all blasting operations should be conducted in strict accordance with existing ordinances and regulations. To ensure that no appreciable vibration was transmitted to existing structures or facilities a monitoring report should be prepared for each blasting event. This report should include, as a minimum, the following information:

Preblast Inspections - Documentation of any preblast observations.

Monitoring Equipment - List of equipment used to monitor the blast.

Time and Location - Date, time and location of blast.

Monitoring Locations - List of structures/facilities monitored.

Acceptance Criteria - Allowable vibration parameters.

Monitoring Records - Seismograph records and interpretation.

Post Blast Inspections - Documentation of any post blast observations.

Information Maintained by the Office of Code Revision Indiana Legislative Services Agency

IC 14-27-7

Chapter 7. Dams, Dikes, and Levees; Regulation

IC 14-27-7-1

"Owner" defined

Sec. 1. As used in this chapter, "owner" means an individual, a firm, a partnership, a copartnership, a lessee, an association, a corporation, an executor, an administrator, a trustee, the state, an agency of the state, a municipal corporation, a political subdivision of the state, a legal entity, a drainage district, a levee district, a conservancy district, any other district established by law, or any other person who has a right, a title, or an interest in or to the property upon which the levee, dike, or floodwall and appurtenant works is located.

As added by P.L.1-1995, SEC.20. Amended by P.L.148-2002, SEC.6.

IC 14-27-7-2

Maintenance and repair

Sec. 2. The owner of a levee, dike, or floodwall and appurtenant works shall maintain and keep the structures and appurtenant works in the state of repair and operating condition required by the following:

(1) The exercise of prudence.

(2) Due regard for life or property.

(3) The application of sound and accepted engineering principles.

As added by P.L.1-1995, SEC.20. Amended by P.L.148-2002, SEC.7.

IC 14-27-7-3

Powers and duties of department

Sec. 3. The department:

(1) has, on behalf of the state, jurisdiction and supervision over the maintenance and repair of levees, dikes, floodwalls, and appurtenant works in, on, or along the rivers and streams of Indiana;

(2) shall exercise care to see that the dikes, floodwalls, levees, and appurtenances are maintained in a good and sufficient state of repair and operating condition to fully perform the intended purpose;

(3) may adopt rules under IC 4-22-2 for maintenance and operation that are necessary for the purposes of this chapter; and

(4) may vary the standards for maintenance and operation, giving due consideration to the following:

(A) The type and location of the dike, floodwall, levee, or appurtenance.

(B) The hazards to which the dike, floodwall, levee, or appurtenance is or may be exposed.

(C) The peril to life or property if the dike, floodwall, levee, or appurtenance fails to perform the structure's function.

As added by P.L.1-1995, SEC.20. Amended by P.L.148-2002, SEC.8.

IC 14-27-7-4

Engineering inspections

Sec. 4. (a) The department shall make an engineering inspection of all levees, dikes, and floodwalls and appurtenant works:

(1) at least one (1) time every three (3) years or at more frequent intervals if the exigencies of the

case require; or

(2) upon the written request of an affected person or agency.

(b) The department shall place in the files of the department a report of each inspection conducted under subsection (a).

(c) This chapter does not apply to the following:

(1) A levee, dike, or floodwall that meets both of the following conditions:

(A) Is under a single private ownership.

(B) Provides protection only to land or other property under the single private ownership.

(2) A dike, floodwall, or levee that is regulated under the federal Mine Safety and Health Act of 1977, unless the dike, floodwall, or levee is proposed to be retained as a permanent structure after bond release.

As added by P.L.1-1995, SEC.20. Amended by P.L.75-1998, SEC.4; P.L.148-2002, SEC.9.

IC 14-27-7-5

Notice of violation

Sec. 5. If the department finds that a dike, floodwall, levee, or appurtenance is:

(1) not sufficiently strong;

(2) not maintained in a good and sufficient state of repair or operating condition; or

(3) unsafe and dangerous to life or property;

the department shall issue a notice of violation to the owner of the dike, floodwall, levee, or appurtenance under IC 14-25.5-2.

As added by P.L.1-1995, SEC.20. Amended by P.L.148-2002, SEC.10; P.L.71-2004, SEC.11.

IC 14-27-7-6

Emergency measures to protect life and property

Sec. 6. (a) If at any time the condition of a levee, a dike, a floodwall, or an appurtenance becomes so dangerous to the safety of life and property that, in the opinion of the department there is not sufficient time for the issuance and enforcement of a notice of violation for the maintenance, alteration, repair, reconstruction, change in construction or location, or removal of the dike, floodwall, levee, or appurtenance in the manner provided in this chapter, the department may immediately take the measures that are essential to provide emergency protection to life and property.

(b) The department may recover the cost of the emergency measures from the owner by appropriate legal action.

As added by P.L.1-1995, SEC.20. Amended by P.L.148-2002, SEC.11.

IC 14-27-7-7

Violations

Sec. 7. An owner who knowingly fails to effect the maintenance, alteration, repair, reconstruction, change in construction or location, or removal within the time limit set forth in the notice of violation of the department under:

(1) section 5 of this chapter; or

(2) IC 13-2-20-4 (before its repeal);

commits a Class B infraction. Every day of failure constitutes a separate infraction.

As added by P.L.1-1995, SEC.20. Amended by P.L.148-2002, SEC.12; P.L.71-2004, SEC.12.

IC 14-27-7-8

Right of entry upon premises

Sec. 8. The department and the department's agents, engineers, and other employees may, for the purposes of determining the department's jurisdiction and performing the engineering inspections provided in section 4 of this chapter, enter upon any land or water in Indiana without liability for

trespass. The owner of a levee, dike, or floodwall and appurtenant works shall do the following:

(1) Cooperate with the department and the department's agents, engineers, and other employees in the conduct of the inspections.

(2) Facilitate access to the dike, floodwall, levee, or appurtenance.

(3) Furnish upon request the plans, specifications, operating and maintenance data, or other information that is pertinent to the dike, floodwall, levee, or appurtenance.

As added by P.L.1-1995, SEC.20. Amended by P.L.148-2002, SEC.13.

IC 14-27-7-9

Exemption of department from liability

Sec. 9. This chapter does not create a liability for damages against the department or the department's officers, agents, and employees caused by or arising out of any of the following:

(1) The construction, maintenance, operation, or failure of a levee, dike, or floodwall and appurtenant works.

(2) The issuance and enforcement of a notice of violation or a rule issued by the department to carry out the department's duties.

As added by P.L.1-1995, SEC.20. Amended by P.L.148-2002, SEC.14.

567—72.3(455B) Dams. The following criteria shall apply to dams which exceed the thresholds in 567—71.3(455B).

72.3(1) *General criteria for all regulated dams.*

a. Required findings. The department will approve the construction, operation or maintenance of a dam or modification of a dam or appurtenant structure only after finding that the project is designed in accordance with accepted engineering practice and methods and in a manner consistent with the applicable criteria and guidelines in department Bulletin No. 16, "Design Criteria and Guidelines for Iowa Dams," December 1990.

b. Anticipation of changed circumstances. In applying the approval criteria in subrule 72.3(1), paragraph *"a,"* consideration shall be given to both existing conditions and potential future conditions which can reasonably be anticipated at the time the application is reviewed.

c. Landowner notification. The department staff engineering review of the plans and specifications for a dam project shall determine whether there are lands upstream, downstream, or adjacent to the impoundment whose use apparently would be potentially adversely affected by maintenance of the dam and appurtenant structures, spillway discharges, temporary ponding of floodwater behind the dam, or failure of the dam. It is the applicant's responsibility to submit sufficient information with the application and on request to enable the staff to accurately identify the owners and occupants of affected lands. The staff shall notify all known affected owners and occupants that the project may affect use of land in which they have an interest and advise them of their opportunity to be heard on the application. The project shall not be approved unless it appears that notice reasonably calculated to advise all owners and occupants has been given and that they have had an opportunity to be heard.

72.3(2) *Dams other than low head dams.* The following criteria shall apply to all dams other than low head dams:

a. Assignment of hazard class. Dams shall be assigned a hazard class based on the potential consequences of failure. Anticipated future land and impoundment use shall be considered in the determination of hazard class. The criteria in this subrule shall be used to determine hazard class regardless of the methodology used in engineering design of a dam. The hazard class shall determine the design requirements of the structure as outlined in department Bulletin No. 16. The hazard class shall be evaluated using the following criteria:

(1) *Low hazard.* A structure shall be classified as low hazard if located in an area where damages from a failure would be limited to loss of the dam, loss of livestock, damages to farm outbuildings, agricultural lands, and lesser used roads, and where loss of human life is considered unlikely.

(2) *Moderate hazard.* A structure shall be classified as moderate hazard if located in an area where failure may damage isolated homes or cabins, industrial or commercial buildings, moderately traveled roads or railroads, interrupt major utility services, but without substantial risk of loss of human life. In addition, structures where the dam and its impoundment are of themselves of public importance, such as dams associated with public water supply systems, industrial water supply or public recreation, or which are an integral feature of a private development complex, shall be considered moderate hazard for design and regulatory purposes unless a higher hazard class is warranted by downstream conditions.

(3) *High hazard.* A structure shall be classified as high hazard if located in an area where failure may create a serious threat of loss of human life or result in serious damage to residential, industrial or commercial areas, important public utilities, public buildings, or major transportation facilities.

(4) *Multiple dams.* Where failure of a dam could contribute to failure of a downstream dam or dams, the minimum hazard class of the dam shall not be less than that of any such downstream structure.

b. Lands, easements, and rights-of-way. An application for approval of a dam project shall include information showing the nature and extent of lands, easements, and rights-of-way which the applicant has acquired or proposes to acquire to satisfy the following criteria:

(1) Ownership or perpetual easements shall be obtained for the area to be occupied by the dam embankment, spillways, and appurtenant structures, and the permanent or maximum normal pool;

(2) Ownership or easements shall be obtained for temporary flooding of areas which would be inundated by the flood pool up to the top of dam elevation and for spillway discharge areas;

(3) Easements covering areas affected by temporary flooding or spillway discharges shall include provisions prohibiting the erection and usage of structures for human habitation or commercial purposes without prior approval by the agency;

(4) In locating the site of a dam and in obtaining easements and rights-of-way, the applicant shall consider the impacts which anticipated changes in land use downstream of a dam or adjacent to the impoundment could have on the hazard class of the dam, the operation of the dam, and the potential liability of the dam owner;

(5) The applicant may be required to acquire control over lands downstream from the dam as necessary to prevent downstream development which would affect the hazard class of the dam.

c. Other approvals required. The applicant shall comply with all applicable provisions of 567—Chapters 51, 52 and 73 concerning water storage permits, operating permits, and inspections.

d. Additional requirements for major dam structures. Dams which are major dam structures as defined in 567—Chapter 70 must satisfy additional criteria set forth in Chapter VI of department Bulletin No. 16.

72.3(3) *Low head dams.* The following criteria shall apply to low head dams:

a. The location and design of a low head dam shall not adversely affect the fisheries or recreational use of the stream.

b. The pool created by a low head dam shall not adversely affect drainage on lands not owned or under easements by the applicant.

c. The structure shall be hydraulically designed to submerge before bankfull stage is reached in the stream channel in order that increased or premature overbank flooding does not occur. Where this cannot be reasonably accomplished in order for the structure to fulfill its intended purpose, the applicant shall demonstrate that any increased flooding will affect only lands owned or controlled by the applicant.

d. For projects which include significant appurtenant structures or works outside the stream channel, the combined effect of the total project shall not create more than 1 foot of backwater during floods which exceed the flow capacity of the channel, unless the proper lands, easements, or rights-of-way are obtained.

e. The structure shall be capable of withstanding the effects of normal and flood flows across its crest and against the abutments, and adjacent channel or bank areas shall be protected against erosion as needed.

72.3(4) *Operating plan.* For any dam with movable structures which must operate or be operated during times of flood or to provide minimum downstream flow, or where the impoundment level is raised or lowered on a regular basis, an operating plan must be submitted for approval. The plan shall be in accordance with department Bulletin No. 16 and rules in 567—Chapter 73.

72.3(5) *Encroachment on a confinement feeding operation structure.* A dam shall not be constructed or modified so that the ordinary high water of the lake, pond or reservoir created by the dam is closer than the following distances from a confinement feeding operation structure unless a secondary containment barrier according to 567—subrule 65.15(17) is in place. Measurement shall be from the closest point of the confinement feeding operation structure to the water edge of the lake, pond or reservoir for a pool level at the elevation of the crest of the emergency spillway or at the top of dam elevation should the dam not have an emergency spillway.

a. Minimum separation between a water source other than a major water source and a confinement feeding operation structure is 500 feet.

b. Minimum separation between a major water source and a confinement feeding operation structure is 1,000 feet or such distance that the structure is not located on land that would be inundated by Q100, whichever is greater.

This rule is intended to implement Iowa Code sections 455B.262, 455B.264, 455B.270, 455B.275 and 455B.277.

CHAPTER I
INTRODUCTION

The purpose of this bulletin is to set forth technical design criteria and guidelines that the Department of Natural Resources will use in reviewing applications to obtain a permit for construction, operation and maintenance or modification of a dam. Other requirements which must be met in order to secure such a permit are outlined in the Iowa Administrative Code under agency number 567. Several chapters of the department's administrative rules in 567 Iowa Administrative Code concern the construction, operation and maintenance of dams as follows:

Chapter 70 contains definitions of terms used in other chapters.

Chapters 50, 51 and 52 concern water permits which must be obtained to authorize storage of water in surface impoundments.

Chapter 71 explains when approval is required in order to construct, modify, operate and maintain dams.

Chapter 72 lists criteria for approval of dam projects.

Chapter 73 concerns operational procedures for dams, fluctuation of water levels in impoundments, abandonment and removal of dams, inspections of dam sites and dams, and designation of unsafe dams. Chapter 73 applies to all dams whose dimensions or effects exceed the regulatory thresholds in Chapter 71.

Copies of the department's administrative rules may be obtained from the Records Center, Department of Natural Resources, Wallace State Office Building, Des Moines, Iowa 50319, upon request.

The above-described rules should be consulted when planning to construct or modify a dam, change the operation or use of a dam, or abandon or remove a dam. This bulletin is part of the above-described rules and is intended for use in conjunction with them. The chapters entitled "Hazard Classifications" and "Lands, Easements, Rights-of-Way" are substantively identical to rules published in the Iowa Administrative Code. These non-technical criteria are repeated in this bulletin for the convenience of the user.

Minimum requirements in this bulletin are labeled as "guidelines" or "criteria" depending on the frequency with which they are likely to be relevant to the safety of a particular type of structure. The distinction between criteria and guidelines is not intended to be rigid. When the applicability of a criterion or guideline to a particular project is not clear to the design engineer, the engineer should consult the department. Any permit issued by the department must explain the reasons for waiving conformity with a criterion or guideline determined to be applicable to the type of structure proposed.

Adoption and Amendment of Bulletin #16. This bulletin has been adopted as part of the department's administrative rules. Pursuant to Section 17A.6(3), Code of Iowa, this bulletin is not published in the Iowa Administrative Code but copies will be made available to the public upon request at no more than the cost of reproduction.

This bulletin may be amended from time to time by rulemaking proceedings. Amended editions of this bulletin will be identified in Chapter 72 of the department's rules by reference to the year and month that the new, superseding edition becomes effective. The user should obtain a copy of current departmental rules as published in the Iowa Administrative Code and compare the edition date on the cover page of this bulletin with the edition date identified in the rules.

CHAPTER II
HAZARD CLASSIFICATION[1]

Dams shall be assigned a hazard class based on the potential consequences of failure. Anticipated future land and impoundment use shall be considered in the determination of hazard class. The criteria in this chapter shall be used to determine hazard class regardless of the methodology used in engineering design of a dam. The hazard class shall determine the design requirements of the structure as outlined in this bulletin. The hazard class shall be evaluated using the following criteria.

A) Low Hazard. Structures located in areas where damages from a failure would be limited to loss of the dam, loss of livestock, damages to farm out-buildings, agricultural lands, and lesser used roads, and where loss of human life is considered unlikely.

B) Moderate Hazard. Structures located in areas where failure may damage isolated homes or cabins, industrial or commercial buildings, moderately traveled roads or railroads, interrupt

[1] This chapter is substantively identical to 567—72.3(2)"a", Iowa Administrative Code.

major utility services, but without substantial risk of loss of human life.

In addition, structures where the dam and its impoundment are of themselves of public importance, such as dams associated with public water supply systems, industrial water supply or public recreation, or which are an integral feature of a private development complex, shall be considered moderate hazard for design and regulatory purposes unless a higher hazard class is warranted by downstream conditions.

C) High Hazard. Structures located in areas where failure may create a serious threat of loss of human life or result in serious damage to residential, industrial or commercial areas, important public utilities, public buildings, or major transportation facilities.

D) Multiple Dams. Where failure of a dam could contribute to failure of a downstream dam or dams, the minimum hazard class of the dam shall not be less than that of any such downstream structure.

CHAPTER III
DESIGN FLOODS

A dam will be required to safely accommodate or pass certain minimum flood events. Routings of the flood hydrograph through the impoundment should begin at an elevation no lower than the normal operating level. The magnitude or frequency of the required flood discharges will vary with the hazard classification, size, and drainage area of the project.

A) Freeboard Design Flood

The specified freeboard design flood represents the greatest flood the dam must be designed to accommodate. The flood must be passed without overtopping of the dam and endangering its safety or the dam must be designed to withstand such overflow. Some erosion damage in earth emergency spillways will be tolerated, provided the safety of the dam would not be compromised.

For dams with emergency spillways, the top of dam elevation after settlement shall not be less than the highest peak pool elevation reached during the freeboard design flood. For dams without an emergency spillway, the top of dam elevation shall be two feet higher than the peak flood elevation expected to occur during passage of the freeboard design flood, unless it is specifically designed to withstand the overflow.

In the following circumstances, the indicated freeboard design flood will be used:

1) All high hazard dams: the probable maximum flood (PMF).

2) All moderate hazard dams, and low hazard dams classified as major structures: one-half (0.5) of the probable maximum flood (a flood hydrograph produced by multiplying the ordinates of the PMF hydrograph by a factor of 0.5).

3) Low hazard dams not classified as major structures:

a. Where the height of the emergency spillway crest* measured above the elevation of the channel bottom at the centerline of the dam (in feet) multiplied by the total storage volume (in acre-feet) to the emergency spillway crest elevation* is between 3,000 and 30,000, the flood shall correspond to the rainfall calculated from the following formula developed by the USDA Soil Conservation Service.

Rainfall = P100 + 0.12 (PMP – P100)

b. Where the height of the emergency spillway crest* measured above

the elevation of the channel bottom at the centerline of the dam (in feet) multiplied by the total storage volume (in acre-feet) to the emergency spillway crest elevation* is less than 3,000, the flood shall be that resulting from the 50-year, 24-hour precipitation.

B) Principal Spillway Design Floods and Discharge Capacity

The principal spillway is normally a concrete or metal conduit or structure which conveys water through or around the dam. Its size and discharge capacity are governed primarily by the following factors: the need to control flood discharges downstream from the dam, and the need to limit both the depth to which floodwaters are impounded and the length of time for which they are impounded. Related to these factors is the need to limit the frequency of operation of emergency spillways.

Except where special considerations must be addressed, the criteria listed below shall apply to the design of principal spillways. The design floods indicated must be passed by the principal spillway without need for operation of an emergency spillway.

1) Design Floods
   a. High hazard dams – the 100-year flood.
   b. Moderate hazard dams – the 50-year flood.
   c. Low hazard dams with drainage areas of 250 acres or more – the 25-year flood.
   d. Low hazard dams with drainage areas less than 250 acres – the 10-year flood.

2) The spillway discharge capacity shall be sufficient to evacuate at least 80% of the volume of water temporarily stored during the principal spillway design flood within 10 days. Where this cannot be accomplished, the emergency spillway and freeboard design flood routings shall be made beginning with the impoundment level at the 10-day drawdown elevation.

3) For dams with emergency spillways of structural concrete or which are excavated into sound rock, a higher frequency of use, and therefore a lower principal spillway design flood, may be permitted if flood control or dam safety would not be adversely affected.

*For dams without emergency spillways, the storage volume and height shall be determined by measuring to the top of dam elevation.

C) Rainfall Depth and Distribution

Precipitation values for various frequency storm events: 10, 25, 50, 100-year and PMP are contained in the Iowa Department of Agriculture and Land Stewardship publication, Climatology of Iowa Series #2, Revised, Iowa Rainfall Frequencies by Paul Waite. Ten-day rainfall amounts are contained in the National Weather Service publication, Technical Paper No. 49.

Some acceptable methods of distributing the rainfall in Iowa are found in the U.S.D.A. Soil Conservation Service publication, TR-60, Earth Dams and Reservoirs; and the Illinois State Water Survey publication, Time Distribution of Rainfall In Heavy Storms by F. A. Huff.

D) Rainfall Losses

Conservative loss rates (interception, infiltration, etc.) and antecedent moisture conditions should be used in computing rainfall excess. Also, when applicable, snowmelt runoff rates should be estimated.

The Soil Conservation Service (SCS) weighted curve number method is acceptable for determining rainfall

losses and is explained in National Engineering Handbook Section 4 Hydrology, SCS, 1972.

E) Storm Duration

Criteria and guidelines for developing design storms from rainfall events are as follows:

1) The critical duration storm or the storm which results in the highest water level in the impoundment, shall be used in determining the freeboard design flood for a high hazard dam.

2) Six hour storms are recommended for determining the freeboard design flood for dams designated in paragraphs A (2) and A (3)"a" of this chapter except where the time of concentration exceeds six hours. The 24-hour storm is recommended for dams designated in paragraph A (3)"b" of this chapter.

3) Twenty-four hour (24-hour) or 10-day storms are recommended for developing principal spillway design floods.

CHAPTER IV
HYDRAULIC AND STRUCTURAL CRITERIA AND GUIDELINES FOR SPILLWAYS

The following criteria and guidelines are design considerations which will be used by the department to insure that spillway structures are capable of functioning safely and efficiently and of resisting the forces to which they may be exposed during the life of the structure.

A) Spillways should be designed to operate safely for the life of the structure and at the discharges and pressures which would be experienced under all normal or flood flow conditions including the freeboard design flood.

B) Anti-seepage collars or other means of piping and seepage control (e.g., drainage diaphragms), anti-vortex devices, trash racks or other inlet debris control measures, and outlet stilling basins should be provided for all conduits unless evidence can be presented establishing they are not necessary.

C) For dams where a conduit is proposed to serve as the principal spillway, suggested minimum sizes of the principal spillway conduit for the indicated type of structure are as follows:

1) High hazard dams and moderate dams classed as major structures – 36-inch inside diameter.

2) Moderate hazard dams not classed as major structures and low hazard dams, which are classed as major structures – 24 inch inside diameter.

3) Low hazard dams not classed as major structures but which have drainage areas of 250 acres or more – 18-inch inside diameter.

4) Low hazard dams with drainage areas under 250 acres – 12-inch inside diameter.

These minimum sizes are applicable to dams with emergency spillways or which are designed for overtopping only. For dams without emergency spillways, substantially larger conduit sizes with special provisions against plugging will normally be required.

D) Drop inlets (risers) should have an inlet cross-sectional area at least 1.5 times that of the conduit and should be constructed of comparable materials.

E) Conduits and risers should be of sufficient strength and have adequate joints to withstand all anticipated

external and internal pressures without damage or leakage, with provisions made for vertical settlement. Conduits should be cambered where significant settlement of the overlying embankment is anticipated. Articulated or bell joints should be provided as necessary to accommodate the maximum elongation estimated to occur during the life of the structure. Risers must be designed to counteract buoyant forces.

F) Corrugated metal pipe conduits and risers should be close riveted with watertight connecting bands and should be fiber bonded, asphalt coated, or given equivalent protection. Cathodic protection shall be provided in corrosive soils. Corrugated metal pipe (CMP) conduits are not recommended for high hazard dams, moderate hazard dams classed as major structures, or where the height of earth fill over the conduit exceeds 25 feet.

G) Concrete conduit and drop inlet (riser) design using precast pipe sections should specify reinforced concrete pressure pipe.

H) Open concrete spillways, concrete box conduits, and concrete flumes or chutes should have longitudinal curbs or raised joints which will prevent contact by normal flows with the construction joint between the floor and wall slabs. Seepage barriers, drainage blankets and drains should be installed where needed to maintain hydraulic flow integrity through the structure and to accommodate anticipated settlement or elongation in the longitudinal or transverse directions.

I) Emergency spillways should be capable of safely conveying excess flood flows around or through the dam. They should not operate except at floods greater than the principal spillway design flood.

J) Earth emergency spillways should be subject to the following minimum requirements at the control section:

1) Minimum bottom width – 10 feet.

2) On major structures, minimum depth – 3 feet. On other structures, minimum depth – 2 feet. (Elevation of top of dam minus elevation of emergency spillway crest.)

3) The profile through the emergency spillway should be horizontal for at least 30 feet through the crest control section.

4) Exit channel slopes should not be less than 1% or greater than 10%, but should provide for maintaining critical depth control at the crest.

K) For dams where substantial erosion in the emergency spillway would pose the risk of a dam failure, the flow velocities during the freeboard design flood should be non-erosive. Where such erosion would pose no substantial risk of failure, the flow velocities should be non-erosive at the discharge which occurs when flow through the control section is at 30% of the maximum depth. On vegetated spillways, the non-erosive velocity should be determined assuming the vegetation is well established.

L) Emergency spillways should be constructed in undisturbed soil wherever possible. Where no viable alternative is available, they may be constructed on fill as a ramp spillway.

M) Smooth transitions in horizontal and vertical alignment should be provided at and between the inlet, the control at the crest and the outlet sections of emergency spillways.

N) All spillways should discharge a safe distance from the toe of the dam, and the inlets and outlets should be so located and aligned as to minimize risk of erosion damage to the dam or of damage to downstream buildings, roads, dams or other structures.

O) An adequate energy dissipation structure (stilling basin) or an alternative acceptable method should be incorporated at the outlet of all structural spillways. On major structures, uplift analysis and arching requirements should be considered.

CHAPTER V
EMBANKMENTS

The earth embankment of a dam should be designed and built according to the following criteria and guidelines.

A) Foreslopes and Backslopes. Embankments should be built of suitable materials and with stable slopes. Foreslopes should not be steeper than 3:1 (horizontal to vertical) in till or loess soils below the permanent water level. Above the permanent water level, foreslopes should not be steeper than 2.5:1 in till soil or 3:1 in loess soil. Backslopes should not be steeper than 2.5:1 in till soils or 3:1 in loess soils. Steeper foreslopes or backslopes may be used if justified by soil tests and stability analysis.

B) Settlement Allowance. A minimum vertical settlement allowance of five percent of the depth of fill should be provided unless a lesser amount is justified by soil tests.

C) Top Width. The minimum embankment top width should be 14 feet for dams 25 feet high or higher. As a rule of thumb, the top width could be reduced by two feet for every five feet of reduction in the height of the dam to a minimum width of eight feet. The top width of dams with roads across the crest should be consistent with normal roadway design practices, including roadway and shoulders.

D) Core Trench. Core trenches should be located approximately along the centerline (axis) of the earth fill. It should be continuous across the base of the fill extending into and up the side slopes of the dam abutments to normal reservoir level. The core trench should be excavated to a minimum depth of five feet or until a suitable base material is reached. The base width should be that which will accommodate excavating equipment, but not less than eight feet. The side slopes of the core trench should not be steeper than 1:1, regardless of depth or width of base. Impervious material shall be used in backfilling the core trench.

E) Wave Erosion Protection. On the upstream face of the dam, a horizontal bench or berm at least 10 feet wide usually should be provided at the normal pool elevation to limit damage from wave erosion. On larger impoundments, riprap or other physical means of protection should be considered whether or not the berm is provided.

F) Site Preparation. All vegetation, sod, stumps, and large roots should be removed from the embankment site, and the ground surface scarified to provide bond with the earth fill. Overhanging banks, pits, or holes should be sloped and graded so slopes do not exceed 1:1, and any other sharp discontinuities in the ground surface shall be smoothed. Special consideration should be given to the removal of sandy or mucky deposits unless otherwise provided for in the design.

In till soils, topsoil should be saved and placed as a surface layer over the finished embankment to provide an adequate seed base in establishing vegetation.

G) Fill. Fill material should be clean earth containing no appreciable amounts of vegetation, large rock, frozen material or other foreign substances. Fill should not be placed on a frozen foundation or in freezing weather.

Moisture content of the fill should be sufficient to assure adequate compaction. A moisture content slightly higher than optimum is recommended. An above optimum moisture content is desirable from the standpoint of providing a more plastic embankment capable of resisting greater differential settlement without experiencing

potentially hazardous cracking. Unless otherwise specified after soil testing, fill should be placed in horizontal lifts not exceeding eight inches extending over the entire fill area and compacted by not less than four overlapping passes by sheepsfoot or rubber tired rollers. Smooth steel rollers or passes by caterpillar tracks are not considered adequate for compaction of earth-fill dams. The surface of the fill should be scarified or roughened if sufficient time elapses between lifts for a crust to develop.

Backfill adjacent to spillway structures and anti-seep collars should be carefully placed and compacted by hand equipment. Heavy equipment shall not pass over conduit structures until two feet of compacted earth cover is in place.

H) Drains. Internal seepage control drains are recommended for all dams and are normally required on major structures unless soils investigation finds they are not needed. Drains should be capable of preventing saturation of the downstream portion of the embankment by intercepting any seepage through the fill or the foundation and any seepage along structural spillways or conduits.

If springs are encountered during site preparation, drains should be provided to allow a controlled outlet.

I) Seeding. As soon as possible after earth fill for the embankment is completed, the embankment and any other exposed areas should be seeded. Mulch or other means of erosion control can be placed as part of seeding and maintained until vegetation is established. Grass or vegetative species selected for use should be appropriate for the soils and conditions expected at the site. Crown vetch is generally not acceptable for dam embankments or emergency spillways.

J) Riprap. Riprap shall be designed for its expected use and anticipated water velocities. All riprap should be placed on a properly designed bedding unless the gradation of the underlying base material is such that it will not infiltrate through the riprap, or an acceptable filter fabric is used.

K) Groins. Where the embankment foreslopes and backslopes intersect the natural or modified abutment slopes, appropriate groin design and erosion control recommendations should be provided.

Embankments composed of concrete, rock, or other materials, as associated with gravity, rockfill and arch dams, designed in accordance with standards by the U.S. Army Corps of Engineers, U.S.D.A. Soil Conservation Service, or the U.S. Bureau of Reclamation are generally acceptable. These types of dams are not normally constructed in Iowa.

CHAPTER VI
SPECIAL REQUIREMENTS FOR MAJOR DAM STRUCTURES

Because of the size, public importance, or potential hazard of a major dam structure, a higher level of investigation, design and assurance of proper construction is needed. A major dam structure is defined as a dam meeting any of the following criteria.

1. Any high hazard dam.

2. Any moderate hazard dam with a permanent storage exceeding one hundred (100) acre-feet or a total of permanent and temporary storage exceeding two hundred fifty (250) acre-feet at the top of the dam elevation.

3. Any dam, including low hazard dams, where the height of the emergency spillway crest measured above the elevation of the channel bottom at the centerline of the dam (in feet) multiplied by the total storage volume (in acre-feet) to the emergency spillway crest elevation exceeds 30,000. For dams without emergency spillways, these measurements shall be taken to the top of dam elevation.

As a condition of permit approval, the following items will be required for major dam structures.

A) A soils and foundation investigation shall be made which includes the evaluation of slope stability requirements, anticipated vertical

settlement and horizontal elongation, seepage and under-seepage potential, whether cathodic protection is needed for metal pipes, and proper construction practices for the soil types and conditions encountered. Stability evaluation shall include end of construction, steady state seepage and sudden drawdown conditions.

B) Anticipated sedimentation rates and their impact on the life and usefulness of the impoundment shall be investigated. Sediment storage shall be provided in the volume necessary for continuation of design uses of the impoundment throughout its design life.

C) A gated low level outlet shall be provided which is capable of draining at least 50 percent of the permanent storage behind the dam within a reasonable length of time. The pipe conduits shall be designed so that negative pressures will not occur at any point along the system.

D) In order to assess the degree of threat to life and property located downstream of the dam, a dam breach analysis may be required. The analysis will be made to determine the most adverse failure condition and the resulting peak outflows and water surface elevations downstream of the dam following failure of the dam during the freeboard design storm.

E) Construction shall be inspected by an engineer registered under Chapter 114 of the Code of Iowa or by a trained inspector under the supervision of the engineer. The engineer shall prepare and certify as-built plans after completion and a report detailing any unusual circumstances encountered during construction and submit them to the Department of Natural Resources, ATTN: Flood Plains.

F) The applicant, as a condition of the permit, shall submit an annual maintenance and inspection report. The report shall describe maintenance work done since the previous annual report, describe any deficiencies observed in the dam or appurtenant structures, detail the remedial measures necessary and the method and time the applicant proposes to correct the deficiencies found. If there is a change in the land use downstream of the dam, this change should be noted on the annual maintenance and inspection report. The applicant may also be required to provide additional inspections and reports by an engineer or other qualified personnel.

CHAPTER VII
SPECIFICATIONS

When detailed project specifications are prepared, they should include the following information.

A) The general provisions which specify the rights, duties, and responsibilities of the owner, applicant, applicant's engineer, and builder or contractor, and the prescribed order of the work.

B) The technical provisions which describe approved work methods, equipment, materials and desired end results.

C) Special provisions as may be required which describe those technical details that are not usually contained in standard technical provisions.

CHAPTER VIII
DAM BREACH ANALYSIS

A) In some cases, it will be necessary to evaluate the consequences of a dam failure to verify hazard classification or adequacy of design. A special case of dam breach analysis will involve failure or improper operation of flood control gates or other structures.

B) Where such evaluations are made by the department's staff, the necessary data will be obtained from topographic maps or other available information. If that information is not adequate, the applicant may be required to obtain additional downstream survey data.

C) Prediction of the downstream consequences of a hypothetical dam breach requires several component steps: development of the impoundment inflow hydrograph; routing the hydrograph through the impoundment; selecting failure conditions for the structure; calculating the outflow hydrograph from the failed structure; and modeling movement of the flood wave downstream to determine travel time, inundated areas, maximum water surface elevations, etc.

D) The criteria, methodology, and computer programs developed by the U.S. Corps of Engineers, the National Weather Service, the U.S.D.A. Soil Conservation Service, and the U.S. Geological Survey for simulating a hypothetical dam failure are, in general, acceptable.

CHAPTER IX
OPERATING PLAN

For any dam with gates or other moveable structures which must operate or be operated during times of flood or to provide a minimum downstream release rate, a written operating plan shall be prepared. Development of such a plan is considered part of the design process. The following shall be addressed in preparation of the operating plan.

A) Responsibility

No operating plan can be expected to work properly unless it can be assured the necessary personnel will be present to operate the equipment, or, in the case of automatic equipment, to monitor it and insure it is functioning properly.

The plan shall identify who is responsible for operating and monitoring the equipment and provide means to assure the necessary personnel are present when needed.

B) Operating Circumstances

The circumstances under which operation must occur shall be clearly defined, and a means provided to insure that operating personnel are present when necessary.

C) Method of Operation

The means and methods by which operation is to be conducted shall be clearly defined. Included shall be such items as rates and sequences for opening or closure of gates, pool level vs. gate setting tables, etc., as required.

The operating plan shall allow for safe passage of all floods up to and including the freeboard design flood. Flood discharges through the dam greater than the design peak flood inflows into the impoundment shall not be permitted. In design and analysis, due consideration shall be given to the potential impacts of the operating procedure on both downstream and poolside lands.

The plan should also address low flow situations and should specify a minimum release rate and how it will be provided and maintained.

Consideration shall also be given to and allowance made for the possible failure of or malfunctioning of the equipment.

D) Discharge Measurement

A means shall be provided to determine the discharge through the control structures, especially where operation is to maintain a minimum downstream flow. Control setting vs. discharge tables, streamflow gages or other means of obtaining discharge readings shall be provided. The settings of control structures shall be easily read.

CHAPTER X
LANDS, EASEMENTS, RIGHTS-OF-WAY*

The determination of lands, easements, and rights-of-way required for the construction, operation and maintenance of a dam project are considered part of the design process. An application for approval of a dam project shall include information showing the nature and extent of lands, easements, and rights-of-way, which the applicant has acquired or proposes to acquire for the project. Acquisition of lands, easements or rights-of-way for construction, operation, and maintenance of a dam project shall be consistent with the following criteria.

A) Ownership or perpetual easements shall be obtained for the area to be occupied by the dam embankment, spillways and appurtenant structures, and the permanent or maximum normal pool.

B) Ownership or easements shall be obtained for temporary flooding of areas which would be inundated by the flood pool up to the top of dam elevation and for spillway discharge areas.

C) Easements covering areas affected by temporary flooding or spillway discharges shall include provisions prohibiting the erection and usage of structures for human habitation or commercial purposes without prior approval by the Department of Natural Resources.

D) In locating the site of a dam and in obtaining easements and rights-of-way, consideration should be given to the impacts which changes in land use downstream of a dam and adjacent to the impoundment could have on the hazard class of the dam, the operation of the dam, and the potential liability of the dam owner.

E) The applicant may be required to acquire control over lands downstream from the dam as necessary to prevent downstream development which would affect the hazard class of the dam.

*This chapter is substantively identical to 567—72.3(2)”b”, Iowa Administrative Code.

567—71.3(455B) Dams. Approval by the department for construction, operation, or maintenance of a dam in the floodway or flood plain of any water source shall be required when the dimensions and effects of such dam exceed the thresholds established by this rule. EXCEPTION: Public road embankments with culverts which impound water only in temporary storage are exempt from the requirements of this rule and shall be reviewed under rules 567—71.1(455B) and 567—72.1(455B). Approval required by this rule shall be coordinated with approval for storage of water required by 567—Chapter 51. Approval by the department shall be required in the following instances:

71.3(1) *Rural areas.* In rural areas:

a. Any dam designed to provide a sum of permanent and temporary storage exceeding 50 acre-feet at the top of dam elevation, or 25 acre-feet if the dam does not have an emergency spillway, and which has a height of 5 feet or more.

b. Any dam designed to provide permanent storage in excess of 18 acre-feet and which has a height of 5 feet or more.

c. Any dam across a stream draining more than 10 square miles.

d. Any dam located within 1 mile of an incorporated municipality, if the dam has a height of 10 feet or more, stores 10 acre-feet or more at the top of dam elevation, and is situated such that the discharge from the dam will flow through the incorporated area.

71.3(2) *Urban areas.* Any dam which exceeds the thresholds in 71.3(1)*"a," "b"* or *"d."*

71.3(3) *Low head dams.* Any low head dam on a stream draining 2 or more square miles in an urban area, or 10 or more square miles in a rural area.

71.3(4) *Modifications to existing dams.* Modification or alteration of any dam or appurtenant structure beyond the scope of ordinary maintenance or repair, or any change in operating procedures, if the dimensions or effects of the dam exceed the applicable thresholds in this rule. Changes in the spillway height or dimensions of the dam or spillway are examples of modifications for which approval is required.

71.3(5) *Mill dams.* Rescinded IAB 2/20/91, effective 3/27/91.

71.3(6) *Maintenance of preexisting dams.* Approval shall be required to maintain a preexisting dam as described in 567—Chapter 73 only if the department determines that the dam poses a significant threat to the well-being of the public or environment and should therefore be removed or repaired and safely maintained. Preexisting dams are subject to the water, air and waste management dam safety inspection program as set forth in 567—Chapter 73.

This rule is intended to implement Iowa Code sections 455B.262, 455B.264, 455B.267, 455B.275 and 455B.277.

Article 24.—NORTHWEST KANSAS GROUNDWATER MANAGEMENT DISTRICT NO. 4

5-24-10. Exemptions for up to 15 acre-feet of groundwater. (a) In any area of the district that is subject to safe yield criteria and is not closed by specific regulation or intensive groundwater use control area order by the chief engineer to new nondomestic, nontemporary permits and term permits for five or fewer years, each application to appropriate groundwater shall be exempt from meeting the safe yield criteria if all the following conditions are met:

(1) The maximum annual quantity of water proposed in the application is 15 acre-feet or less.

(2) The well spacing criteria of K.A.R. 5-24-3 have been met.

(3) An existing water right from the same source of water supply that has a point of diversion located within two miles of the proposed point of diversion has its authorized annual quantity reduced as described in subsection (b).

(4) All issues relating to the possible abandonment of the offsetting water right are resolved by the chief engineer before determining the annual quantity of offset water that is available from the existing water right.

(5) The approval of the application does not authorize an additional quantity of water out of an existing authorized well with a nondomestic permit or water right that would result in a total combined annual quantity of water authorized from that well in excess of 15 acre-feet.

(6) The approval of the application does not authorize an additional quantity of water to be used on a currently authorized nondomestic place of use.

(b) If the water right to be used as the offset for the new appropriation is a water right authorized for irrigation use, the authorized quantity of water needed to offset the new appropriation of not more than 15 acre-feet of water shall be calculated as follows:

(1) Step one.

(A) Multiply the net irrigation requirement for the 50 percent chance rainfall for the county of origin, as specified in K.A.R. 5-5-12, times the maximum number of acres legally irrigated in any one calendar year during the perfection period. For vested rights, the acreage used shall be the maximum acreage legally irrigated in any one calendar year before June 28, 1945.

(B) The calculation made in paragraph (b)(1)(A) shall result in the maximum annual quantity of water that could be changed to another type of beneficial use if the entire water right were changed pursuant to K.A.R. 5-5-9(a)(1).

(2) Step two.

(A) Divide the annual quantity of water desired to be changed to the new beneficial use by the maximum annual quantity of water that could be changed if the entire water right were changed to the new use.

(B) The calculation made in paragraph (b)(2)(A) shall result in the percentage of the entire reduced water right that will be changed to the new use. The remaining percentage of the current water right may be retained by the irrigation water right owner.

(3) Step three.

(A) Multiply the remaining percentage calculated in paragraph (b)(2)(B) times the total currently authorized quantity. The resulting product

shall be the annual quantity of water that can be retained by the irrigation water right owner.

(B) The portion of the authorized annual quantity of water not retained by the irrigator as described in paragraph (b)(3)(A) shall be permanently reduced from the authorized annual quantity of the offsetting water right and used to offset the new appropriation.

(c) If the water right to be used as the offset for the new appropriation is an existing water right authorized for nonirrigation use, the total net consumptive use of the offsetting water right after the change and the new appropriation shall not exceed the net consumptive use of the offsetting water right before the change.

(d) The place of use authorized by the offsetting water right shall be reduced in proportion to the reduction in the maximum annual quantity of water as determined in paragraph (b)(1)(B). If the owner of the irrigation water right desires to retain more authorized acres, the directions specified in K.A.R. 5-5-11(b)(2)(B)(ii) shall be followed to determine whether the irrigator may retain more acres in the authorized place of use.

(e) After the use of not more than 15 acre-feet has been approved pursuant to this regulation, no application for change for that water right shall be approved for any quantity of water that would authorize the water to be diverted from a currently authorized point of diversion or to be used on a currently authorized place of use. (Authorized by K.S.A. 82a-706a and K.S.A. 2005 Supp. 82a-1028; implementing K.S.A. 2005 Supp. 82a-1028; effective Jan. 10, 2003; amended Dec. 8, 2006.)

Article 40.—DESIGN OF EARTH DAMS

5-40-1. Definitions. As used in K.S.A. 82a-301 through 82a-305a and amendments thereto, in the regulations adopted pursuant to these statutes, and by the chief engineer in administering K.S.A. 82a-301 through 82a-305a and amendments thereto, the following terms shall have the meanings ascribed to them in this regulation, unless the context clearly requires otherwise:

(a) "Application" means the formal document and any required supporting information that are submitted to the chief engineer and request a permit, pursuant to K.S.A. 82a-301 through 82a-305a, and amendments thereto.

(b) "Appurtenant works" means the primary spillway and other conduits through a dam, the valves, the auxiliary spillway, the service spillway, the stilling basin, any constructed outlet channel, all dikes and berms designed and constructed to protect the dam, the drains, and all other features constructed to protect or operate a dam.

(c) "As-built drawings" means the drawings showing a permitted project and all appurtenant works as the project and works were actually built. This term shall include the following:

(1) All deviations from the plans that were approved by the chief engineer;

(2) the location and design of any instruments and monitoring equipment that were installed at the site;

(3) the location and elevation of any benchmarks; and

(4) a certification that the permitted project was constructed as shown on the as-built drawings.

(d) "Authorized representative" means any employee of the chief engineer designated by the chief engineer to perform duties and functions on behalf of the chief engineer.

(e) "Auxiliary spillway" means an open channel that is constructed over or around an embankment for the purpose of conveying safely past the dam the flows that are greater than the primary spillway design discharge and that can be stored in the detention storage. This term is also known as an emergency spillway.

(f) "Benchmark" means a reference point or object of known elevation and location that is not expected to move horizontally or vertically during the life of the project.

(g) "Borrow area" means land, usually located near the dam, from which earth used to construct the embankment will be excavated.

(h) "Breach analysis" means an engineering analysis to determine the areas that would be inundated if a dam failed.

(i) "Channel change" means any project that alters the course, current, or cross section of any stream.

(j) "Chief engineer" means the chief engineer, division of water resources of the Kansas department of agriculture.

(k) "Control section" means the immediate downstream end of the level section of an open-channel earthen spillway. The elevation of the control section is the elevation of the open-channel spillway crest.

(l) "Cutoff collar" means a projecting flange built or installed completely around the outside of a pipe to lengthen the path of seepage along the outer surface of the pipe.

(m) "Cutoff trench" means an excavation under a dam to be later filled with impervious material to prevent or reduce the seepage of water through the foundation of a dam.

(n) "Design discharge" means the maximum rate of flow, expressed in cubic feet per second, released from a dam's spillways for the design storm.

(o) "Design storm" means the precipitation event specified in K.A.R. 5-40-22 that is the minimum precipitation event required to be used to design a particular dam.

(p) "Detention storage" means the volume in the reservoir between the lowest uncontrolled spillway, not including any low-flow augmentation works, and the crest of the auxiliary spillway.

(q) "Detention storm" means the storm described in K.A.R. 5-40-23.

(r) "Easily erodible soils" means soils with a high content of fine sand or silt and with little or no cohesion or plasticity, including fine sand, silt, sandy loam, and silty loam.

(s) "Effective height" means the difference in elevation between the crest of an auxiliary spillway or service spillway and the lowest point of the downstream toe of a dam. If the dam does not have an auxiliary or service spillway, the effective height means the difference in elevation between the top of the dam and the lowest point of the downstream toe of the dam.

(t) "Effective storage" means the volume of storage space in a reservoir below the crest of the auxiliary spillway or service spillway and above the elevation of the downstream toe of the dam at its lowest point. Effective storage shall not be reduced by accounting for accumulated sediment.

(u) "Embankment" means the earthen-fill portion of the dam.

(v) "Emergency action plan" means a formal document that identifies potential emergency conditions at a dam and specifies preplanned actions to be followed to minimize property damage and loss of life if the dam fails.

(w) "Erosion-resistant soils" means cohesive soils with a high clay content and high plasticity, including silty clay, sandy clay, and clay.

(x) "Freeboard" means the vertical distance between the maximum water surface elevation attained during the design storm and the top of the dam.

(y) "General plan" means a plan adopted by a watershed district, drainage district, or similar entity required by statute to be approved by the chief engineer, including any of the plans formulated under K.S.A. 24-901 and K.S.A. 24-1213, and amendments thereto.

(z) "Hazard" means the property or people that could be damaged or endangered by the failure of a dam, including people or property that might be inundated. This term shall include a public or industrial water supply stored in the reservoir created by the dam that would be released if the dam failed.

(aa) "High-impact dams" means all of the following classes of dams:

(1) Size class 4, hazard class A dams;

(2) size classes 3 and 4, hazard class B dams; and

(3) all hazard class C dams, using the definitions of hazard class and size class in K.A.R. 5-40-20 and K.A.R. 5-40-21.

(bb) "Hydraulically most distant point in the watershed" means the point in a watershed from which a raindrop falling at that point takes the longest time to reach the dam.

(cc) "Impervious material" means material that allows a relatively low rate of water movement through its cross section.

(dd) "Inspection year" means the period on and after May 1 of one year through April 30 of the following year. The inspection year shall be named for the calendar year in which the inspection year ends.

(ee) "Inundation area" means the area below a dam that will be inundated with water as determined by conducting a breach analysis meeting the requirements specified in K.A.R. 5-40-24.

(ff) "Invert" means the lowest point on the inside of the outlet of a conduit.

(gg) "Low-flow augmentation works" means any uncontrolled conduit, orifice, or other appurtenant works that slowly release water from storage in a reservoir, or bypass low flow through a reservoir.

(hh) "Low-impact dams" means all of the following classes of dams:

(1) Size classes 1, 2, and 3, hazard class A dams; and

(2) size classes 1 and 2, hazard class B dams, using the definitions of hazard class and size class in K.A.R. 5-40-20 and K.A.R. 5-40-21.

(ii) "Maintenance" means the actions or upkeep performed on a dam or its appurtenances to compensate for wear and tear on the dam and appurtenances and to preserve the dam and appurtenances so that the dam and appurtenances

function properly until they are removed, including woody vegetation control; grass seeding; burrowing animal control; repair of minor erosion, cracks, animal burrows, and minor settling; care of pipes, piezometers, drains, valves, gates, and other mechanical devices; replenishment of riprap; and removal of debris from spillways.

(jj) "Modification" means any change in a dam or its appurtenances that involves a change to or significant disturbance of the embankment, an alteration of the flow characteristics of a spillway, a change in the storage capacity or freeboard, or any other significant alteration in the functioning of the dam.

(kk) "Navigable stream" means any of the following:

(1) The Arkansas river;

(2) the Missouri river; or

(3) the Kansas river.

(ll) "One percent-chance storm" means a rainfall event that has a one percent chance of being equaled or exceeded one or more times in a year.

(mm) "Owner of a dam" means the owner or owners of the land upon which a dam and appurtenant works are constructed unless an easement authorizes another person or entity to construct and maintain a dam on that easement. With such an easement, the holder of the easement shall be considered to be the owner of the dam.

(nn) "Perennial stream" means a stream, or part of a stream, that flows continuously during all of the calendar year, except during an extreme drought.

(oo) "Permanent pool" means the storage space in a reservoir below the elevation of the lowest uncontrolled spillway, not including any low-flow augmentation works. This term is also known as the "normal pool."

(pp) "Permit" means the consent or other formal document issued by the chief engineer that authorizes the construction, repair, or modification of a dam, channel change, or stream obstruction, and its operation and maintenance.

(qq) "PMP" means the probable maximum precipitation that can occur in a precipitation event as prescribed by K.A.R. 5-40-31.

(rr) "Prejurisdictional dam" means any of the following:

(1) A dam constructed before May 28, 1929;

(2) a dam constructed by an agency or political subdivision of state government, other than a county, city, town, or township, before April 11, 1978; or

(3) a dam constructed before July 1, 2002 that is 25 or more feet in height and impounds less than 30 acre-feet of water at the top of the dam.

(ss) "Primary spillway" means the uncontrolled outlet device through a dam that provides the initial outlet for storm flows, usually consisting of either of the following:

(1) A riser structure in combination with an outlet conduit; or

(2) a canopy or hooded inlet structure in combination with an outlet conduit.

This term is also known as a "principal spillway."

(tt) "Rainfall excess" means that part of the rain in a given storm that falls at intensities exceeding the infiltration capacity of the land and that is the volume of the rain available for direct runoff.

(uu) "Reservoir" means the area upstream from a dam that contains, or can contain, impounded water.

(vv) "Repair" means any action, other than maintenance, taken to restore a dam and its appurtenant works to their original permitted condition.

(ww) "Service spillway" means an open-channel spillway constructed over or around a dam embankment to convey safely past the dam all flows entering the reservoir that cannot be stored in the reservoir behind a dam that does not have a primary spillway.

(xx) "Size factor" means the effective height of the dam, expressed in feet, multiplied by the effective storage of the reservoir, expressed in acre-feet.

(yy) "Stilling basin" means an open structure or excavation at the outlet of a spillway that dissipates the energy of fast-moving water being discharged from the spillway to protect the streambed below a dam from erosion.

(zz) "Stream" means any watercourse that has a well-defined bed and well-defined banks and that has a watershed above the point marking the site of the project that exceeds the following number of acres in the zones specified:

(1) Zone three: 640 acres for all geographic points within any county west of a line formed by the adjoining eastern boundaries of Phillips, Rooks, Ellis, Rush, Pawnee, Edwards, Kiowa, and Comanche counties;

(2) zone two: 320 acres for all geographic points within any county located east of zone three and west of a line formed by the adjoining eastern boundaries of Republic, Cloud, Ottawa, Saline,

McPherson, Reno, Kingman, and Harper counties; and

(3) zone one: 240 acres for all geographic points within any county located east of zone two.

The flow of a stream is not necessarily continuous and can occur only briefly after a rain in the watershed. If the site of the project has been altered so that a determination of whether the well-defined bed and banks did exist is not possible, it shall be presumed that the bed and banks did exist if the watershed acreage criteria specified in this subsection have been met, unless the owner of the project conclusively demonstrates that the well-defined bed and banks did not exist when the project site was in its natural state and had not been altered by human activity.

(aaa) "Stream obstruction" means any project or structure that is wholly or partially placed or constructed in a stream and that does not meet the definition of a dam in K.S.A. 82a-301 and amendments thereto.

(bbb) "Time of concentration" means the time required for runoff to flow from the hydraulically most distant point in the watershed to the watershed outlet once the soil has become saturated and minor depressions have been filled.

(ccc) "Trash rack" means a protective device installed on the inlet of a primary spillway to prevent trash and other debris from obstructing the primary spillway without obstructing the flow of water.

(ddd) "Watershed" means all of the area draining toward a selected point on a stream.

(eee) "Wing dike" means an earthen or rock structure below the toe of a dam that is constructed to protect the embankment from erosion.

(fff) "Zone," in an earthen dam, means a segment of earthen fill containing similar materials.

(ggg) "Zoned fill" means an embankment divided into two or more zones to make the best use of available materials. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 1, 1983; amended May 1, 1987; amended, T-5-12-30-91, Dec. 30, 1991; amended Feb. 17, 1992; amended Sept. 22, 2000; amended May 18, 2007.)

5-40-2. Dams; plans and specifications. The plans required by K.S.A. 82a-302, and amendments thereto, to construct, repair, or modify a dam shall include sufficient views to show all features in three dimensions and in sufficient detail to instruct a competent contractor to construct, repair, or modify the dam by viewing the plans and specifications. All plans with multiple pages shall include an index describing the location of required views within the plans. The views and maps specified in this regulation shall be shown. Specific details shall be listed under the view that is typically most appropriate, but they may be displayed on another view to improve the legibility of the plans if sufficient detail is provided in the plans to describe each feature in three dimensions. The required plans shall include the following:

(a) Plan views of the dam and dam site, which shall include both abutments of the dam, the area downstream to the point where the auxiliary spillway or service spillway flows enter the receiving channel, and the area upstream of the upstream toe of the dam to where the borrow area will be permitted. All elevations shown on plans shall be referenced to the same datum as the benchmarks described on the plans. The following details shall be shown, if applicable:

(1) The location of the axis of the dam, showing stationing and top width limits;

(2) the toe of the upstream and downstream slopes;

(3) the location of the centerline and the limits of each open-channel spillway;

(4) the location of the primary spillway and any stilling basin;

(5) the location of each berm;

(6) the location of slope protection;

(7) the location of borings, test holes, and test pits;

(8) the location of intakes, outlets, valves, and valve wells;

(9) the location, description, and elevation of each benchmark;

(10) the location, description, and details of all foundation drains;

(11) the location and limits of each borrow area; and

(12) the location and topography of the area where the auxiliary spillway discharge returns to the receiving stream;

(b) a map of the drainage pattern above and below the dam site drawn to an appropriate scale. The map shall show the following:

(1) The location of the watercourse across which the dam is to be built and the point where the centerline of the dam crosses the centerline of the stream specified in latitude and longitude,

or in feet north and west of the southeast corner of the section;

(2) the location of the dam and the outline of the reservoir;

(3) the boundary of the watershed, shown by a line enclosing the entire area that will drain into the reservoir;

(4) section lines, with sections properly identified; and

(5) the size of the drainage area in acres or square miles;

(c) a topographic map of the dam site and reservoir area, which shall be shown to a scale that provides sufficient detail to clearly show the required features and to locate them in the field, but in no case is less than 1 to 3,600. The elevation of each contour shall be clearly noted on the map. The following details shall be shown:

(1) The location of the dam; and

(2) the following topography:

(A) The contours at two-foot intervals. For dams more than 20 feet in height, contours may be spaced at greater intervals, but the interval shall not exceed four feet;

(B) the contour equivalent to the elevation of the lowest uncontrolled spillway inlet, not including any low-flow augmentation works;

(C) the contour equivalent to the maximum water surface reached during the design storm;

(D) the contour equivalent to the elevation of the top of the dam;

(E) construction ingress and egress routes to the dam and reservoir;

(F) the name and address of each person owning any of the following:

(i) The land on which the dam and its appurtenances, including the auxiliary spillway or service spillway, down to the location where the spillway discharges back to the receiving stream, will be constructed;

(ii) ingress and egress routes to the dam and reservoir;

(iii) the reservoir site up to the top of the dam elevation; and

(iv) the borrow areas if they are located outside the reservoir site;

(G) if the reservoir area is divided between more than one landowner, the property lines, which shall be shown on the topographic map of the reservoir;

(H) roads, railroads, pipeline crossings, and any other prominent features in the vicinity;

(I) the boundary line for each easement; and

(J) the limits of each borrow area;

(d) the cross-section view of the valley at the dam site, which shall be shown along the centerline of the dam with the same stationing as that used on the plan view. The following shall be shown:

(1) The elevation to which the top of the dam is to be maintained and the elevation to which the dam is to be initially constructed in order to provide an adequate settlement allowance;

(2) the location and elevation of the auxiliary spillway or service spillway at the centerline of the dam;

(3) the original surface of the ground, including the streambed, up to the elevation of the top of the dam;

(4) the proposed elevations of the bottom of the cutoff trench; and

(5) the location of all test holes and the materials encountered in the test holes;

(e) a cross-section view perpendicular to the centerline of the dam at the lowest point on the downstream toe extending to the limits of the fill being placed. If the cross section is variable, a typical section shall be shown for each reach of similar cross section with a proper description of the reach by stationing. Additional typical cross sections along the centerline of the primary spillway and the centerline of any other outlets shall be shown. Cross sections of the dam shall include the following:

(1) The elevations of the shoulders and centerline of the dam and the width of the top of the dam;

(2) the elevation of the top of any berm, the elevation of the outside shoulder of any berm, and the top width of any berm;

(3) the slopes of upstream and downstream faces of the dam;

(4) the elevation, location, and type of slope protection;

(5) the zones of the embankment;

(6) the dimensions to which the dam is to be constructed to provide an adequate allowance for settlement;

(7) the elevation, location, and dimensions of the planned cutoff trench; and

(8) the elevation of the downstream toe of the dam at its lowest point;

(f) the following information concerning each open-channel spillway:

(1) A plan view showing the location and sta-

tioning along the centerline of the spillway, together with the location of the control section;

(2) cross sections showing side slopes and dimensions of the spillway, and the original surface of the ground up to the point where the spillway sides intersect the original ground surface;

(3) a profile along the centerline of the spillway, extending from the point upstream where the profile of the spillway intersects natural ground through the control section to the streambed below the dam. The stationing on the profile shall correspond to that on the plan view. The station and elevation of the breaks in the grade of the spillway shall be shown. This profile shall show the existing ground elevation, proposed grade of the bottom of the spillway, elevation of slope protection on the side slopes, and geologic logs of the borings required in the auxiliary spillway or service spillway by K.A.R. 5-40-40, superimposed on the profile through which the spillway is excavated; and

(4) the data necessary to stake out any curves;

(g) the following information concerning the primary spillway:

(1) The profile along the centerline of the spillway, extending from the intake to the outlet, showing the size, dimensions, and locations of seepage control features. This profile shall show existing ground elevations and the proposed grade of the spillway;

(2) the plan, profile, and cross-section views of the stilling basin, primary spillway supports, and other features;

(3) the geologic logs of the borings done in the vicinity of the primary spillway shall be superimposed on the profile;

(4) the location and type of all bedding materials;

(5) a table of pipe grades for all concrete pipes; and

(6) conduit joint details;

(h) the number of acres enclosed by each contour within the reservoir area and the total storage capacity of the reservoir in acre-feet at the elevation of each contour, which shall be determined and tabulated on the plan. The data shall be compiled for all contours in the reservoir up to the elevation of the top of the dam. Computations of capacity shall be based on the natural topography of the reservoir basin but may include the volume of any excavation in the reservoir made during construction of the dam;

(i) a curve or table showing the discharge capacities, in cubic feet per second, of all spillways through a range of surface water elevations from the lowest spillway inlet elevation to the top of the dam elevation, which shall be developed and shown on the plans or in the design report;

(j) the following information, which shall be shown on the plans in plan view, profile, and cross section:

(1) Drain details, including foundation drains;

(2) permanent erosion control protection, including riprap; and

(3) details of stilling basins, outlets, and other appurtenant structures; and

(k) the following information, which shall be shown on either the plans or the specifications:

(1) A table of gradation for each drain; and

(2) a table of gradation of the bedding of the riprap. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 1, 1983; amended May 1, 1985; amended May 1, 1987; amended May 18, 2007.)

5-40-2a. Benchmarks. (a) At least two permanent benchmarks shall be installed for future reference at each dam. Each benchmark shall be located according to the following criteria:

(1) In an area where the benchmark will not be disturbed, destroyed, or inundated after the dam is complete; and

(2) along the centerline of the dam on either end of the dam, if practical, and in undisturbed soil.

(b) On high-impact dams, each permanent benchmark shall also meet the following criteria:

(1) Be installed in a hole that meets the following criteria:

(A) Is 12 inches in diameter; and

(B) is at least 42 inches deep or is drilled to bedrock, whichever is less;

(2) be constructed of one or more steel reinforcing bars at least ⅜ inch in diameter and 36 inches in length or the length of the depth of the hole, whichever is less. The reinforcing bar or bars shall be placed in the hole and the hole backfilled with concrete rounded off flush with the ground;

(3) be capped by a metal survey marker; and

(4) be either marked by a witness post or survey marker sign or tied to at least two objects in the vicinity by distance and bearing.

(c) On low-impact dams, each permanent benchmark shall also meet the following minimum requirements:

(1) Be constructed of a reinforcing bar that is 36 inches long, one-half inch in diameter, and driven flush with the surface of the ground;

(2) be installed at a location protected from grazing animals and vehicular traffic; and

(3) be either marked by a witness post or survey marker sign or tied to at least two objects in the vicinity by distance and bearing.

(d)(1) The elevation and horizontal location of each permanent benchmark shall be shown on the as-built drawings or the construction inspection report. The location of each permanent benchmark shall be described in reference to centerline stationing and offset from the centerline. The elevation of each permanent benchmark for all of the following classes of dams shall be referenced to the national geodetic vertical datum of 1988, or other acceptable national vertical datum, to a tolerance of plus or minus 0.5 foot:

(A) Class size two, hazard classes B and C;

(B) class size three dams; and

(C) class size four dams.

(2) The elevation of each benchmark for class sizes one and two, hazard class A dams may be referenced to an assumed datum.

(e) Horizontal control shall be referenced to the Kansas state plane coordinate system as set forth in K.S.A. 58-20a01 et seq., and amendments thereto. The location of each benchmark shall be shown on the as-built drawings or the notice of completion by using either of the following:

(1) The plane coordinate values consisting of a northing and an easting from the appropriate monumented point according to K.S.A. 58-20a03, and amendments thereto; or

(2) the feet distances north or south, and east or west, from the nearest or most convenient section corner. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-2b. Design reports. (a) The application for each permit to construct, repair, or modify a dam shall be accompanied by a design report prepared by the engineer who designed the new dam or the repair or modification of an existing dam. The design report shall document every major design element of the dam, the conditions that must be addressed in the construction of the project, and the manner in which those conditions will be addressed. The design report shall document the design process, including references to each design method and computer program utilized in the design, and shall include the following:

(1) The design of any slope protection for the embankment and the auxiliary or service spillway. If no slope protection is provided, the report shall provide justification for not having slope protection;

(2) documentation of the determination of the hazard class;

(3) a report of the geotechnical investigation, including the results of the testing required in K.A.R. 5-40-40 through K.A.R. 5-40-42, and all boring logs not shown on the plans;

(4) documentation of the embankment design based upon the geotechnical investigation;

(5) documentation of the hydrological evaluation, including the determination of the composite curve number and drainage area;

(6) if a proposed dam is part of a general plan, the report shall evaluate whether the proposed dam conforms to the general plan;

(7) the design of the foundations, including the proposed depth of the cutoff trench;

(8) the design of the drains, including size, material gradation, interface with soil, and outlets;

(9) the design of the pipe bedding, including documentation that the loading and deflection conditions are met;

(10) the stilling basin design;

(11) documentation of the flood routing or routings;

(12) the gradation of the material in the diaphragm and the design of the diaphragm; and

(13) any other relevant information required by the chief engineer.

(b) In addition to those items required in subsection (a), the design report for each high-impact dam shall include the following:

(1) The auxiliary spillway or service spillway analysis required by K.A.R. 5-40-56(c), if applicable, or K.A.R. 5-40-57(a);

(2) a slope stability analysis; and

(3) an embankment settlement analysis. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-3. Specifications. (a) Each applicant shall submit specifications with the application for a permit to construct a dam. The specifications shall address every major element in the construction of the dam and the materials used to construct the dam. The specifications shall be clear,

legible, and sufficiently detailed to ensure that the dam and appurtenant works will be properly constructed and shall meet the requirements of sound engineering principles and commonly accepted engineering practices. The specifications shall state the minimum quality of materials and workmanship that is acceptable and the required materials tests and testing frequency. The specifications shall cover the following:

(1) The excavation procedures;

(2) the placement and compaction of earthen fill;

(3) the dewatering process;

(4) concrete and reinforcing steel requirements and placement;

(5) the materials for and placement of all conduits;

(6) the materials for and placement of permanent erosion control measures;

(7) drains and seepage control, including aggregate requirements; and

(8) seeding and fencing.

The specifications shall also include an index. The specifications may be submitted electronically in a form and manner prescribed by the chief engineer.

(b) A copy of the plans and specifications that have been approved by the chief engineer shall be accessible at the construction site at all times during construction. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 1, 1983; amended May 1, 1987; amended May 18, 2007.)

5-40-4. Preparer of maps, plans, profiles, reports, and specifications. In addition to the requirements of the Kansas state board of technical professions, the requirements in this regulation shall apply. (a) Each map, plan, profile, report, and specification submitted to the chief engineer for approval shall be prepared by, or under the supervision of, a person who is competent in the design and construction of channel changes or stream obstructions, as appropriate.

(b) Maps, plans, profiles, reports, and specifications for any dam shall be prepared by, or under the supervision of, a licensed professional engineer who is competent in the design and construction of dams.

(c) Maps, plans, profiles, reports, and specifications for any channel change or stream obstruction project on a navigable stream or a stream having a mean annual flow of 100 cubic feet per second or more at the proposed location of the project shall be prepared by a licensed professional engineer who is competent in the design of that type of project.

(d) No provision of this regulation, and no decision made by the chief engineer pursuant to this regulation, shall alter the responsibilities or duties of any licensee of the Kansas state board of technical professions to comply with that board's requirements. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 1, 1983; amended May 1, 1986; amended May 1, 1987; amended Sept. 22, 2000; amended May 18, 2007.)

5-40-5. Determining the capacity of a reservoir. (a) The capacity of each proposed reservoir shall be determined as specified in K.A.R. 5-40-2(h).

(b) The capacity of each existing reservoir shall be determined by using the procedure specified in K.A.R. 5-40-2(h) for contours above the water surface. The engineer determining the reservoir capacity shall demonstrate the validity of the method that the engineer selects to extrapolate the data for contours below the water surface. The capacity of an existing reservoir shall not be reduced by including the accumulated sediment. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-301 and 82a-303a; effective May 1, 1983; amended May 18, 2007.)

5-40-5a. Determining the height of a dam or barrier. To determine the height of a dam or barrier pursuant to K.S.A. 82a-301(b) and amendments thereto, that measurement shall be made as follows: (a) The height of a dam or barrier that extends across the natural bed of a stream or watercourse shall be the vertical distance measured from the bed of the stream or watercourse at the downstream toe of the dam or barrier to the lowest elevation on the top of the dam or barrier, excluding any open-channel spillway and any anomalous low points.

(b) The height of a dam or barrier that does not extend across the natural bed of a stream or watercourse shall be the vertical distance measured from the lowest elevation of the outside limit of the dam or barrier to the lowest elevation on the top of the dam or barrier, excluding any open-channel spillway and any anomalous low points.

(c) The height of a proposed barrier or dam shall be measured from the planned top of the

dam, excluding any allowance for settlement. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-301 and 82a-303a; effective May 18, 2007.)

5-40-8. Acceptable application. (a) To be acceptable for filing, each application for a permit to construct, modify, or repair a dam, other stream obstruction, or channel change shall be accompanied by the statutorily required filing fee and shall contain all of the following:

(1) One copy of the completed application on a form prescribed by the chief engineer and signed by the applicant;

(2) two copies of the maps, plans, specifications, and profiles for a proposed or existing dam that meet the requirements of these regulations or one copy of the maps, plans, specifications, and profiles for any other stream obstruction or channel change that meet the requirements of these regulations; and

(3) for a proposed or existing dam, one copy of the design report that meets the requirements of these regulations.

(b) If the applicant fails to meet the requirements of subsection (a), the applicant shall be notified by the chief engineer of the deficiencies in writing and given 60 days from the time the notice is postmarked to submit the required items. If the required items are not submitted within 30 days after the chief engineer's notice is postmarked, a reminder letter shall be sent to applicant again requesting the required items.

(c) Any applicant may submit a request for an extension of time to provide a complete application. The applicant shall submit the request for extension of time before the deadline to submit the items. The request shall also include a justification for the extension of time and an estimate of the time needed to submit the required items.

(d) If the required items are not submitted within 60 days after the chief engineer's notification of deficiency, or within any authorized extension of time, the application shall be dismissed and the application fee forfeited.

(e) If the dismissed application was for the construction, repair, or modification of an existing illegal, unpermitted dam, the removal of the dam shall be ordered by the chief engineer.

(f) If an application is dismissed pursuant to this regulation, within 30 days of the date of dismissal the applicant may apply to have the application reinstated. The application may be reinstated by the chief engineer for good cause shown by the applicant. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-301, 82a-302, and 82a-303a and K.S.A. 82a-303c; effective May 1, 1983; amended May 18, 2007.)

5-40-9. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-302; effective May 1, 1983; amended May 1, 1985; amended May 1, 1986; revoked May 18, 2007.)

5-40-10. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-302; effective May 1, 1984; amended May 1, 1985; amended May 1, 1986; revoked May 18, 2007.)

5-40-11. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-302 and 82a-303; effective Sept. 22, 2000; revoked May 18, 2007.)

5-40-12. As-built drawings. (a) Each permit shall be conditioned by the chief engineer to require as-built drawings for each category listed in subsection (b) to be submitted within 90 days of the completion of the dam, repairs, or modifications, or any extension of time authorized by the chief engineer for good cause. The drawings shall be prepared by a person qualified to prepare the original plans and specifications pursuant to K.A.R. 5-40-4.

(b) As-built drawings shall be submitted for each of the following categories:

(1) All high-impact dams;

(2) any dam, if required by the chief engineer as a condition of the permit to build, repair, or modify the dam; and

(3) any dam, if required by the chief engineer as the result of an approval of a change in the approved plans requested by the applicant during construction.

(c) The as-built drawings shall show all the features of the structure included in the approved plans as those features were constructed. A legibly marked-up copy of the approved plans shall be acceptable as as-built drawings.

(d) A profile of the bottom of the cutoff trench as constructed shall be shown on the as-built drawings. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 82a-303 and 82a-303a; effective May 1, 1987; amended May 18, 2007.)

5-40-13. (Authorized by K.S.A. 82a-303a;

implementing K.S.A. 82a-303; effective May 1, 1987; revoked May 18, 2007.)

5-40-20. Hazard classes of dams. (a) The hazard classes of dams shall be determined from the following based on the location of the dam, the hazards found within the inundation area, and the impact of a failure of a dam:

(1) A "hazard class A dam" shall mean a dam located in an area where failure could damage only farm or other uninhabited buildings, agricultural or undeveloped land including hiking trails, or traffic on low-volume roads that meet the requirements for hazard class A dams as specified in subsections (b) and (c).

(2) A "hazard class B dam" shall mean a dam located in an area where failure could endanger a few lives, damage an isolated home, damage traffic on moderate-volume roads that meet the requirements for hazard class B dams as specified in subsections (b) and (c), damage low-volume railroad tracks, interrupt the use or service of a utility serving a small number of customers, or inundate recreation facilities, including campground areas intermittently used for sleeping and serving a relatively small number of persons.

(3) A "hazard class C dam" shall mean a dam located in an area where failure could result in any of the following:

(A) Extensive loss of life;

(B) damage to more than one home;

(C) damage to industrial or commercial facilities;

(D) interruption of a public utility serving a large number of customers;

(E) damage to traffic on high-volume roads that meet the requirements for hazard class C dams as specified in subsections (b) and (c) or a high-volume railroad line;

(F) inundation of a frequently used recreation facility serving a relatively large number of persons; or

(G) two or more individual hazards described in hazard class B.

(b) If there is a road across any part of the embankment or a spillway, including the auxiliary spillway or service spillway channel down to the receiving stream, the daily vehicular traffic shall be considered in determining the hazard classification, in addition to the criteria specified in subsection (a). The hazard classifications specified in this subsection shall be used if these classifications are more stringent than the hazard classifications required by subsection (a).

Hazard class	Vehicles per day
A	0 through 100
B	101 through 500
C	more than 500

(c) If any road in the inundation area does not meet the criteria of subsection (b), the daily vehicular traffic shall be considered in determining the hazard classification, in addition to the criteria specified in subsection (a). The hazard classifications specified in this subsection shall be used if these classifications are more stringent than the hazard classifications otherwise required by subsection (a).

Hazard class	Vehicles per day
A	0 through 500
B	501 through 1,500
C	more than 1,500

(Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-303a and 82a-303b; effective May 18, 2007.)

5-40-21. Class sizes of dams. (a) Each dam that the chief engineer has authority to regulate pursuant to K.S.A. 82a-301 et seq., and amendments thereto, with an effective height of less than 25 feet and an effective storage of less than 50 acre-feet shall be considered to be a class size 1 dam. The class size of all other dams shall be determined from the following table:

Class size	Size factor
2	less than 3,000
3	3,000 through 30,000
4	more than 30,000

(b) Each existing permitted dam and each dam for which an application was submitted before the effective date of this regulation shall continue to have the effective height measured from the flow line of the stream at the centerline of the dam. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-303a and 82a-303b; effective May 18, 2007.)

5-40-22. Design requirements for construction of a dam. Each dam constructed shall meet or exceed the design requirements specified in the table in this regulation. The minimum top of the dam elevation shall be the maximum water surface elevation determined by routing the design storm specified in the following table, using

the methodology specified in K.A.R. 5-40-30 through K.A.R. 5-40-33, through the reservoir and the dam's spillways, plus the minimum freeboard shown in the following table. The minimum floor width of the open-channel spillway shall be the minimum floor width shown in the following table.

Dam size class	Hazard class	Precipitation for design storm	Minimum freeboard in feet	Minimum floor width of open-channel spillway in feet
1	A	2% chance	1	20
	B	0.25 PMP	2	
	C	0.40 PMP	3	
2	A	1% chance	2	30
	B	0.25 PMP	2	
	C	0.40 PMP	3	
3	A	1% chance	3	40
	B	0.30 PMP	3	
	C	0.40 PMP	3	
4	A	0.25 PMP	3	40
	B	0.30 PMP	3	
	C	0.40 PMP	3	

(Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-23. Detention storage. (a) To determine the minimum required detention storage, the applicant shall show that the computed runoff from the detention storm can be stored in the reservoir and discharged through the primary spillway without any flow being discharged through the auxiliary spillway. The elevation of the auxiliary spillway control section shall be set so that the computed runoff from the detention storm specified in the following table and determined from the procedures in K.A.R. 5-40-30 through K.A.R. 5-40-33 does not result in discharge through the auxiliary spillway.

Hazard class	Size	Purpose	Minimum detention storm
A	1, 2	Flood control	4% chance
A	3	Flood control	4% chance
A	4	Flood control	2% chance
B	All	Flood control	2% chance
C	All	Flood control	2% chance
A	1, 2	All uses other than flood control	50% chance
A	3	All uses other than flood control	50% chance
A	4	All uses other than flood control	20% chance
B	All	All uses other than flood control	20% chance
C	All	All uses other than flood control	20% chance

Each dam that has flood control as a purpose shall meet the detention storm requirements for a flood control structure. A dam that is not constructed for flood control purposes and whose auxiliary spillway meets the requirements for a service spillway in K.A.R. 5-40-57 shall not be required to meet any minimum detention storm requirement in the table in this subsection.

(b) Each dam shall have a primary spillway and an auxiliary spillway, unless a service spillway meeting the requirements of K.A.R. 5-40-57 is provided. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-24. Dam breach analysis. A dam breach analysis shall be conducted on each proposed dam as specified in this regulation. If a dam breach analysis is required for an existing dam, the analysis shall be conducted in the same manner as that specified in this regulation for a proposed dam. (a) To determine the appropriate water surface elevation in the reservoir when the breach begins, the breach analysis shall route the appropriate design duration one percent-chance storm determined by K.A.R. 5-40-31 through the reservoir. The routing shall begin by assuming that the water surface elevation is at the elevation of the lowest uncontrolled spillway inlet, not including any low-flow augmentation works. The antecedent moisture condition (AMC) used to determine the runoff shall be determined according to K.A.R. 5-40-32. The minimum water surface elevation used to begin the breach analysis shall be the greater of the following:

(1) The water surface elevation determined by routing the required design duration one percent-chance storm through the reservoir; or

(2) the elevation of the crest of the auxiliary spillway.

Routing the storm through the reservoir may account for the discharge of the primary spillway and any open-channel spillways. If the dam does not have an open-channel spillway, the water sur-

face elevation used shall be the elevation of the top of the dam or the elevation resulting from using PMP as the runoff event, whichever is lower.

(b) The breach discharge shall be determined by using the peak breach discharge criteria section on pages 1-1 through 1-2 in "earth dams and reservoirs," TR-60, dated July 2005, published by the conservation engineering division of the natural resources conservation service, and hereby adopted by reference, unless the applicant receives written approval of the chief engineer to use a model that is more appropriate for a particular dam. The breach discharge hydrograph shall be determined by methods in NRCS TR-66, third edition, "simplified dam-breach routing procedure," dated September 1985, which is hereby adopted by reference, including the appendices. If another model is used, the following breach modeling assumptions shall be used, unless the applicant demonstrates to the chief engineer that more appropriate assumptions should be used:

(1) The parameters shall support the assumption of a rapidly developing breach that is either an overtopping failure or a spillway failure caused by intense, localized erosion beginning at the downstream end of the auxiliary spillway or service spillway and working its way upstream.

(2) If the breach model has breach width as a variable, the minimum bottom width of the breach shall be twice the height of the dam. If there is a well-defined physical floodplain, the height of the dam may be measured from the top of the low bank of the stream to the top of the dam for the purpose of determining the minimum breach width.

(3) If the side slopes of the breach are a parameter of the model, vertical side slopes shall be used.

(4) If the breach model has breach time as a variable, the maximum breach time shall be one minute per foot of height of the dam.

(c) The breach discharge shall be routed downstream using a hydraulic flow model in accordance with sound engineering principles and commonly accepted engineering practices. An unsteady state hydraulic flow model shall be used if it is necessary to model existing hydraulic structures in the inundation area. In all other instances, a steady state hydraulic flow model may be used.

(d) The inundation area analyzed shall meet both of the following requirements:

(1) Be from the downstream toe of the dam and the control section of any open-channel section of any open-channel spillway, downstream to the point where the crest of the breach wave intersects the flood level of the peak discharge of the one percent-chance storm, assuming that the dam was not in place; and

(2) be analyzed to the point at which there are no more hazards downstream.

The peak discharge of the one percent-chance storm may be determined by any of the methods provided in K.A.R. 5-42-5 or the appropriate published flood insurance study for the stream receiving the discharge from the breach of the dam.

(e) If there is more than one dam on a stream, it shall be assumed that the most upstream dam is breached first and that the peak flow of that breach arrives at the next downstream dam at the same time the peak water surface elevation from the inflow of the one percent-chance storm from the uncontrolled portion of the lower dam's drainage area occurs. An appropriate model may be used to demonstrate when the peaks will occur for an entire system of dams, in which case the water surface elevation modeled shall be used.

(f) If there are dams on separate tributaries above the dam being analyzed, the modeling assumption specified in subsection (e) shall be applied only to the tributary that has the upstream dam whose breach results in the greatest computed breach discharge at the dam being analyzed.

(g) If digital elevation data is used in the analysis of the breach, the data used shall have a root mean square error of 2.5 meters or less.

(h) Cross sections for modeling purposes shall be taken at appropriate locations, but in no case shall the intervals be less than 2,640 feet measured along the floodplain of the watercourse. Cross sections shall be generally perpendicular to the direction of flow and the contour lines that the cross sections intersect. Cross sections may be broken into several connected segments as needed to meet the requirements of this subsection.

(i) Each bridge and any other hydraulic structure that has a significant hydraulic effect shall be included in the analysis.

(j)(1) The applicant shall submit a contour map of the valley with contour intervals of 10 feet or less and a scale of not less than 1:24,000, which shall show the following:

(A) The inundation area determined from the breach;

(B) the location of each existing hazard; and

(C) each cross section entered in the hydraulic flow model with a label identifying the cross section.

(2) The following items shall be shown on the contour map or on separate documentation:

(A) The elevation of each existing hazard;

(B) the water surface elevation at each existing hazard;

(C) the elevation of the streambed at the point nearest each existing hazard; and

(D) a tabular report including the following information for each cross section:

(i) The label identifying each cross section shown on the map;

(ii) the elevation of the maximum water surface attained during the breach;

(iii) the peak discharge; and

(iv) the computed width of the water surface.

(3) If there are more than 10 hazards in any 2,640-foot reach in the flood inundation area, the information required in paragraph (j)(2) may be noted only for the hazard in that reach that is closest to the maximum water surface elevation measured vertically and the hazard in that reach that is farthest from the maximum water surface elevation measured vertically.

(k) The applicant shall submit one copy of each data file used to perform each analysis in electronic form along with identification of the computer programs used to perform the analysis and any model documentation needed for the chief engineer to review the analysis. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-26. Request to issue or reconsider hazard class determination. (a)(1) If an owner or applicant does not agree with the hazard classification determined for a dam, the owner or applicant may file a request for reconsideration of the hazard class determination.

(2) Each request for reconsideration shall be submitted in writing and shall indicate the following:

(A) The owner's or applicant's proposed hazard classification;

(B) the basis of that proposal; and

(C) an explanation of why the owner or applicant believes that the determination of the hazard classification by the chief engineer is incorrect. The request shall also contain documentation and analysis that support the request.

(3) Each request for reconsideration shall be filed with the chief engineer within 15 days after the owner or applicant is served with written notice of the hazard classification by the office of the chief engineer or within any extension of time authorized by the chief engineer in writing.

(b) Each request for reconsideration shall be reviewed by the chief engineer, and a final written determination of the hazard classification shall be made by the chief engineer.

(c) If the chief engineer has not issued a written notice of the hazard classification, the owner or applicant may request a written notice after the owner or applicant has been informed verbally of the proposed hazard classification by the chief engineer. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-303a and 82a-303b; effective May 18, 2007.)

5-40-30. Time of concentration. (a) Except as specified in subsections (b) and (c), the time of concentration (T_c) shall be determined by using one of the methods specified in chapter 15, "travel time, time of concentration and lag," in the natural resources conservation service (NRCS) national engineering handbook, part 630, dated August 1972, which is hereby adopted by reference.

(b) For drainage areas of not more than three square miles, the time of concentration (T_c) may be determined by use of the Kirpich formula, which is as follows:

$$T_c = \left(\frac{11.9L^3}{H} \right)^{0.385}$$

Where

T_c = the time of concentration, in hours

L = the longest distance that water has to travel in the drainage basin, in miles

H = the maximum elevation difference in the drainage basin, in feet.

(c) In addition to the methods specified in subsections (a) and (b), the applicant may determine T_c based on sound engineering principles and commonly accepted engineering practices if the applicant obtains the prior written consent of the chief engineer. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-31. Design duration rainfall depth. (a) If the time of concentration is six hours or less, a duration of six hours shall be used for all design

storms. The appropriate six-hour storm depth, in inches, shall be selected from the following table.

County	Probability of occurrence in any year					
	50%	**20%**	**4%**	**2%**	**1%**	**PMP**
Allen	2.7	3.5	4.8	5.4	6.1	28.0

(b) If the time of concentration of the watershed, or any subwatershed being used to develop the inflow hydrograph, is more than six hours, the ratio for the time equal to or greater than the computed time of concentration shall be selected from the following table. Linear interpolation shall be acceptable. That ratio shall be multiplied by the depth of the six-hour rainfall in the table in subsection (a). The resulting depth is the design duration rainfall depth.

Relative increase in rainfall amount for storm durations over six hours

Time (hours)	100-year ratio	PMP ratio
6	1.000	1.000
6.5	1.019	1.013
7	1.035	1.025
7.5	1.051	1.037
8	1.066	1.048
8.5	1.081	1.058
9	1.094	1.068
9.5	1.108	1.078
10	1.120	1.087
10.5	1.132	1.096
11	1.144	1.104
11.5	1.155	1.112
12	1.166	1.120
13	1.187	1.134
14	1.207	1.148
15	1.225	1.161
16	1.243	1.173
17	1.259	1.185
18	1.275	1.196
20	1.305	1.217
22	1.333	1.236
24	1.359	1.254

(c) If the drainage area exceeds 10 square miles, the rainfall depth obtained from the table in subsection (a) may be reduced by the ratio shown in the table in this subsection. The ratio for the zone in which the dam is located and a drainage area less than or equal to the actual drainage area above the dam shall be selected. The use of linear interpolation shall be acceptable. That ratio shall be multiplied by the depth of rainfall from the table in subsection (a). The result is the design duration rainfall depth. The ratios in subsection (b) and this subsection may be used together, if subsections (b) and (c) both apply.

Drainage area (sq. mi.)	Reduction ratio		
	Zone 1	Zone 2	Zone 3
10	1.00	1.00	1.00
12	0.99	0.99	0.98
15	0.97	0.95	0.93
17	0.96	0.94	0.91
20	0.94	0.91	0.88
22	0.93	0.90	0.86
25	0.92	0.88	0.83
27	0.92	0.87	0.82
30	0.91	0.86	0.80
35	0.90	0.84	0.77
40	0.88	0.82	0.75
45	0.87	0.80	0.72
50	0.86	0.78	0.70
60	0.84	0.75	0.65
70	0.82	0.72	0.62
80	0.80	0.70	0.59
90	0.79	0.68	0.57
100	0.78	0.67	0.55

Zone 1, zone 2, and zone 3 shall have the meanings specified in K.A.R. 5-40-1 under the definition of a "stream." (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-32. Determination of rainfall excess. (a) Rainfall excess shall be determined by using the natural resource conservation service (NRCS) runoff curve number method.

(b) The antecedent moisture condition (AMC) to be used when determining the curve number for the design storm shall be one of the following:

(1) For zone one, the curve number determined using AMC III;

(2) for zone two, the curve number determined by averaging the AMC II and AMC III curve numbers; or

(3) for zone three, the curve number determined using AMC II.

Zone one, zone two, and zone three shall have

the meanings specified in K.A.R. 5-40-1 under the definition of a "stream."

(c) If the drainage basin is in two zones, the curve number may be weighted based on the drainage area within each zone.

(d) AMC II shall be used in determining the rainfall-runoff relationship used to compute the required detention storage. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-33. Hydrographs. The rainfall excess determined in K.A.R. 5-40-32 shall be used to determine the time-discharge relationship of inflow to the reservoir for the detention storm and design storm using the techniques described in chapter 16, "hydrographs," in the natural resource conservation service (NRCS) national engineering handbook, part 630, dated March 2007, which is hereby adopted by reference. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-40. Geotechnical investigation of all dams. (a) Each applicant shall ensure that a sufficient geotechnical investigation is performed on the proposed site for each dam to design the dam in accordance with the regulations of the chief engineer and with sound engineering principles and commonly accepted engineering practices. The materials under the proposed dam, open-channel spillway, and borrow area shall be investigated before design and submission of the application for a permit to construct a dam. If unusual or unexpected foundation conditions are encountered in the investigations required in this regulation, additional geotechnical investigation and soil mechanics testing shall be performed as necessary to design and construct the dam in accordance with the regulations of the chief engineer and with sound engineering principles and commonly accepted engineering practices.

(b) The geotechnical investigation specified in these regulations shall be designed by a licensed professional competent in geotechnical investigation and analysis for dams.

(c) The geotechnical information specified in these regulations shall be included in the engineering design report and submitted with the proposed construction plans. The report shall contain a general description of the geotechnical investigation, including the method used for sampling.

(d) The soils sampled in all of the geotechnical investigations shall be classified by using field classification methods and the uniform soil classification system.

(e) The dam design shall make appropriate accommodations for the geology discovered in the investigation.

(f)(1) The foundation of the dam shall be investigated to a depth of not less than one-half the height of the dam at the location of the test hole plus five feet.

(2) If unweathered bedrock is encountered before reaching the sampling depth required in paragraph (f)(1), the sampling shall be done to the unweathered bedrock.

(g) The static water level in each test hole shall be recorded.

(h) A sufficient number of test holes shall be made in each open-channel spillway to determine the stability of the spillway crest and the outlet channel down to the streambed elevation.

(i) A sufficient number of test holes in the borrow area shall be made to determine the amount of suitable material available and to classify the soil to be used in the embankment. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-41. Geotechnical investigation of a low-impact dam. (a) In addition to meeting the requirements of K.A.R. 5-40-40, each low-impact dam shall have a sufficient number of properly placed test holes to be representative of the geology under the proposed dam embankment, with an average of at least one test hole each 200 feet along the centerline of the dam and at least three test holes.

(b) Except as specified in subsection (d) and K.A.R. 5-40-74, each existing unpermitted, illegal dam shall have the same level of geotechnical investigation as that required for a proposed new dam, except that testing the borrow area shall not be required, before a permit will be issued. In addition, the condition of the following shall be determined:

(1) All conduits passing through the embankment;

(2) the embankment in the vicinity of the conduits; and

(3) the rest of the embankment, including any slides, seeps, saturated areas, sloughs, and other visible anomalies in the embankment.

(c) If there are any signs of instability in the embankment, the stability of the slope of the ex-

isting embankment shall be analyzed according to the requirements of K.A.R. 5-40-46(c).

(d) An existing unpermitted, illegal low-hazard dam that is class size 1, 2, or 3, for which a qualified professional has conducted an inspection and submitted to the chief engineer a report of that investigation demonstrating that a geotechnical investigation is not necessary to protect the public safety and property, shall not be required to have the geotechnical investigation required by subsection (b). (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-42. Geotechnical investigation of a high-impact dam. (a) In addition to meeting the requirements of K.A.R. 5-40-40, each proposed high-impact dam shall have at least the following number of geotechnical test holes:

(1) A sufficient number of properly placed test holes to be representative of the geology under the proposed dam embankment, with an average of at least one test hole every 100 feet along and as close to the centerline of the dam as practical and a minimum of three test holes; and

(2) a test hole as close as practical to the anticipated location of the following:

(A) The base of the drop inlet; and

(B) the support of the outlet pipe.

(b) At least one representative sample of undisturbed soil shall be tested to determine shear strength parameters, permeability, and compressability.

(c) The geotechnical investigation shall determine the following for at least one representative sample:

(1) Atterberg limits;

(2) the settlement characteristics of the proposed embankment materials and the foundation of the dam;

(3) the Proctor compaction curves of soils;

(4) gradation tests of foundation materials, especially where drain systems could be located; and

(5) any other properties necessary to design a dam to meet the requirements of the regulations of the chief engineer, sound engineering principles, and commonly accepted engineering practices.

(d) Each existing unpermitted, illegal dam shall have the same level of geotechnical investigation as that required for a proposed dam, except that testing the borrow area shall not be required, before a permit may be issued. In addition, the following properties shall be determined:

(1) The condition of all conduits passing through the embankment and the condition of the embankment in the vicinity of the conduits;

(2) the in situ density of the existing embankment and its foundation;

(3) the condition of the embankment, including any slides, seeps, saturated areas, sloughs, and other visible anomalies in the embankment; and

(4) a slope stability analysis of the existing embankment, which shall be performed according to the requirements of K.A.R. 5-40-46. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-43. Cutoff trench. (a) Each dam shall have a cutoff trench. The cutoff trench shall meet all of the following requirements:

(1) Have side slopes no steeper than one horizontal unit to one vertical unit;

(2) have a bottom width of 10 or more feet as necessary to meet the compaction requirements of K.A.R. 5-40-44;

(3) be constructed to the depth justified in the design report based on the findings in the geotechnical report, unless observations by the inspecting engineer during construction justify a different depth;

(4) be backfilled with the most impervious material available at the site. If no impervious material is available at the site, then this material shall be procured off-site;

(5) be backfilled with material that is contiguous to and homogeneous with the most impervious zone within the dam, if the dam is designed as a zoned fill;

(6) be constructed in lifts that shall not exceed nine inches for each lift; and

(7) be constructed of a material that has been brought to acceptable moisture content.

(b) The material placed in the cutoff trench shall be placed according to the same specifications as those required for the embankment in K.A.R. 5-40-44. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-44. Embankment. (a) The minimum top width of an embankment shall be determined from the following table:

Height of dam (in feet)	Minimum top width (in feet)
less than 20	10
20 through 24.9	12
25 through 39.9	14
40 or greater	15

(b) The top of the dam shall be sloped toward the reservoir, unless special measures are taken to adequately control erosion on the downstream side of the dam.

(c) The height of each lift in the embankment and cutoff trench shall be no more than nine inches, unless the dam is designed as a zoned fill. If the dam is designed as a zoned fill, the lifts outside the cutoff trench and most impermeable zone may be larger if geotechnical data is provided that shows that adequate compaction can be achieved using lifts in excess of nine inches.

(d) The material in each low-impact embankment and cutoff trench shall be brought to a moisture content that can be compacted in accordance with this subsection. Each application for a low-impact dam shall contain specifications requiring adequate compaction. The minimum compaction required shall be achieved by one of the following:

(1) Using a sheepsfoot roller until the feet cease to push into the fill material and start to walk across the compacted surface;

(2) using the controlled movement of rubber-tired earth-moving equipment so that every point on the surface of each lift is traversed by not less than one tread track of the equipment; or

(3) using another method that achieves the compaction required by this subsection.

(e) Each high-impact dam shall include the following in its specifications for earth placement in the embankment and cutoff trench:

(1) The minimum and maximum allowable levels of soil moisture;

(2) the compaction standards;

(3) a provision for testing the soils placed during construction; and

(4) a means to ensure that the compaction standards approved by the chief engineer are met during construction.

(f) In addition to the requirements of subsections (d) and (e), the specifications for hand-compacted fill around each conduit in the embankment shall meet the following requirements:

(1) Set a maximum lift of one-third the diameter of the outside of the conduit. However, no lift shall exceed four inches; and

(2) specify a minimum distance around the conduit for hand compaction. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-45. Allowance for settlement of an earthen dam. (a) A detailed soil mechanics investigation report shall be submitted as part of the design report for each high-impact dam. An appropriate allowance for settlement shall be made based on the results in the soil mechanics report.

(b) If a detailed soil mechanics investigation report is not submitted for a low-impact dam, at least five percent of the height of the dam shall be allowed for settlement of the embankment.

(c) An allowance for settlement on each dam may be made by steepening the side slopes during construction and adding to the height of the embankment as needed to increase the height of the dam. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-46. Side slopes of an earthen dam. (a) The side slopes of each earthen dam shall be designed and constructed to be stable and easily maintained.

(b) A slope stability analysis shall be required on each high-impact dam.

(c) If a slope stability analysis is required, the minimum factor of safety shall be based on the steady-state seepage load condition with the water level at the elevation of the lowest open-channel spillway or other uncontrolled spillway with a trash rack that meets the requirements of K.A.R. 5-40-51, as shown in the following table:

Class size	Hazard class	Factor of safety
4	A	1.4
3, 4	B	1.5
1, 2, 3, 4	C	1.5

(d) Each dam whose face is subject to prevailing winds shall be given additional protection from erosion caused by wave action, which may include a flatter side slope, the use of riprap, or the use of grass or vegetation adapted to fluctuating water levels. The design of any slope protection for the embankment and the auxiliary spillway or service spillway shall be shown on the plans. If no slope protection is provided, regardless of the orientation of the dam, the design report shall provide justification for not having slope protection.

(e) The steepest allowable design side slope shall be three horizontal units to one vertical unit on the upstream side of the dam, and two and

one-half horizontal units to one vertical unit on the downstream slope of the dam. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-50. Pipes. (a) Each pipe under or through an embankment shall meet the following requirements:

(1) Be capable of withstanding the external load without buckling, cracking, being damaged, or being deformed. The minimum internal diameter of the pipe shall not be reduced by more than the pipe manufacturer's stated allowable, long-term pipe deflection limit and in no case by more than five percent;

(2) be designed to adequately resist flotation;

(3) be impervious to water, with watertight joints and seams;

(4) except for drawdown pipes, be installed with sufficient slope to provide adequate drainage, with a minimum average slope of one percent after settlement. No pipe shall have an adverse grade through any section of pipe;

(5) if the pipe is installed in conjunction with a riser on a high-impact dam, be placed to insure that the requirements of paragraph (a)(4) are met and that all pipe sections are properly aligned after settlement of the foundation and consolidation of the embankment;

(6) have the discharge end extended a sufficient distance beyond the downstream toe of the dam to avoid erosion to the dam;

(7) be adequately supported at the discharge end to prevent deflection when the pipe is flowing full; and

(8) if the pipe is a primary spillway, be sized to evacuate 95 percent of the detention storage in 14 or fewer days.

(b) Steel cylinder-reinforced concrete pipe shall be acceptable for use in any dam if the design computations, plans, and specifications related to the placement of the pipe meet the minimum requirements of the manufacturer.

(c) In applying the provisions of subsections (c), (e), and (f), the depth of fill over the top of each pipe shall be measured from the top of the embankment after settlement has occurred. Reinforced concrete pipe shall be acceptable for use in a low-impact dam if less than 30 feet of fill will be placed over the pipe and if the design computations, plans, and specifications related to the placement of the pipe meet the minimum requirements of the manufacturer.

(d) Each metal pipe shall be coated with a protective coating adequate to prevent corrosion for the planned life of the dam, or the design report shall include an estimate of the expected life of the pipe, the expected life of the dam, and a plan for replacement of the pipe when it no longer functions as designed.

(e) Corrugated metal pipe shall be acceptable for use in any hazard class A or B dam if no more than 25 feet of fill is placed over the pipe.

(f)(1) Polyvinyl chloride pipe shall be acceptable for use in any dam if the maximum fill over the pipe does not exceed the depth specified in the following table:

Standard dimension ratio (SDR)	Maximum fill over top of pipe (feet)
SDR 17 and thicker	35
SDR 18	31
SDR 21	23
SDR 25	18
SDR 26	16
SDR 28	14

A pipe with walls thinner than SDR 28 shall not be used.

(2) Polyvinyl chloride pipe shall not be placed in high-plasticity soils.

(3) Each portion of polyvinyl chloride pipe that will be exposed to sunlight shall be protected as recommended by the manufacturer of the pipe or shall be encased in a protective material.

(g) Pipe materials other than those described in subsections (b) through (f) may be used if the applicant demonstrates that all of the following criteria are met:

(1) The pipe material, accounting for any protective measures that will be taken, has a minimum expected life of 25 years if exposed to sunlight or buried in soil with the same characteristics of the soil to be used to construct the dam.

(2) All of the pipe manufacturer's design recommendations are met by the plans and specifications for the dam and are documented in the design report.

(3) All of the pipe manufacturer's recommendations for bedding, supporting, and installing the pipe are included in the specifications for construction of the dam, except those specifications that are demonstrated in the design report to be inapplicable in the construction of the proposed dam.

(4) The design report includes an estimate of

the life of the pipe, the life of the dam, and a plan to replace the pipe when it no longer functions as designed if the design life of the pipe is less than that of the dam.

(5) The design report demonstrates that the proposed placement and use of the pipe will meet the requirements of sound engineering principles and commonly accepted engineering practices.

(h) If the estimated life of a pipe is less than the estimated life of the dam, the permit shall contain the condition that the pipe shall be replaced when the pipe no longer functions properly. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-51. Acceptable trash racks for primary spillways. (a) Except as specified in subsection (c), each new or modified primary spillway permitted on or after the effective date of this regulation shall be equipped with an acceptable trash rack, as specified in subsection (b).

(b) "Acceptable trash rack" shall mean a trash rack designed and constructed to prevent debris from clogging the inlet of the primary spillway or the primary spillway conduit. Each acceptable trash rack shall be constructed of material of sufficient strength to withstand the impact of the material that could strike the inlet.

(c)(1) Each primary spillway in a dam permitted before the effective date of this regulation shall be equipped with the acceptable trash rack required by the permit and approval of design. If no trash rack was required by the permit and approval of design, no trash rack shall be required unless the primary spillway fails to function properly.

(2) If the applicant demonstrates that there is not sufficient woody vegetation or other debris in the drainage area to justify the installation of an acceptable trash rack, the requirement to have an acceptable trash rack may be waived.

(d) If a fish screen is installed, the screen shall not impair the functioning of the primary spillway. If a fish screen is proposed, the design report shall demonstrate that the screen is designed in accordance with the standards of subsection (b) and will not impair the functioning of the primary spillway. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-52. Stilling basins. (a) For each new dam, for each primary spillway conduit replacement, and for each existing dam for which the chief engineer determines that it is necessary to protect the integrity of the embankment, each primary spillway conduit with a cross-sectional area in excess of 1.75 square feet shall discharge into one of the following:

(1) A constructed stilling basin below the downstream toe of the dam; or

(2) any other constructed works designed to dissipate energy and prevent erosion.

(b) If a stilling basin is required or constructed, the stilling basin shall be designed to dissipate the energy of the water exiting the conduit so that the stilling basin discharges water to the receiving channel without causing excessive erosion and the stilling basin itself is not damaged by full conduit flow.

(c) The invert of the outlet conduit that discharges into a stilling basin shall be located at least one foot above the tailwater elevation in the stilling basin when water is flowing through the primary spillway at the maximum rate of discharge during the design storm. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-53. Drawdown pipes. (a) Except as specified in subsection (b), each dam shall be equipped with a drawdown pipe that meets the requirements for a pipe as specified in K.A.R. 5-40-50. A valve or gate shall be installed in the pipe so that the controls are accessible and damage from freezing is prevented. Drawdown pipes may be incorporated into the primary spillway.

(b) The installation of a drawdown pipe shall not be required for a low-impact dam if the chief engineer determines that both of the following criteria are met:

(1) The failure to install a drawdown pipe will not prejudicially and unreasonably affect the public interest and the public safety.

(2) The drawdown pipe is not necessary to administer water rights.

(c) Each drawdown pipe shall have the capacity to evacuate 90 percent of the volume of the permanent pool in 14 or fewer days assuming no inflow into the reservoir, but in no case shall the drawdown pipe have an internal diameter of less than four inches. The inlet of the drawdown pipe shall be constructed to reduce the likelihood of plugging. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-54. Control of seepage along a conduit. (a) Each conduit through any portion of a dam below the elevation of the permanent pool shall be constructed to protect the dam from seepage along the conduit by means of cutoff collars or a drainage diaphragm. Cutoff collars may be used only on hazard class A dams that are class sizes one and two.

(b) Each drainage diaphragm shall meet all of the following design criteria:

(1) Be installed so that the largest face is perpendicular to the conduit;

(2) be sized as follows:

(A) If the conduit is circular, the diaphragm shall extend a minimum of two feet or three times the outside diameter of the conduit, whichever is greater, from the outside surface of the conduit horizontally and vertically upward. The diaphragm shall extend vertically downward a minimum of two feet from the outside surface of the conduit;

(B) if the conduit is rectangular, the diaphragm shall extend minimum of two feet or three times the vertical dimension of the conduit, whichever is greater, from the outside surface of the conduit horizontally and vertically upward. The diaphragm shall extend vertically downward a minimum of two feet from the outside surface of the conduit;

(C) a drainage diaphragm shall not be required to penetrate unweathered bedrock; and

(D) the diaphragm shall not be required to extend vertically upward to an elevation higher than the crest of the auxiliary spillway;

(3) have a dimension parallel to the conduit that is at least three feet thick;

(4) except as specified in subsection (d), be located downstream of the centerline of the dam, downstream of the cutoff trench, and far enough upstream of the toe so that there is a minimum of two feet of fill, measured perpendicular to the surface of the embankment, over the top of the diaphragm after settlement of the embankment; and

(5) have an outlet that provides positive drainage of the diaphragm to the stilling basin or other point below the downstream toe of the dam. The flow line of the outlet shall be no lower than one-half foot above the elevation of the outlet of the stilling basin.

(c) Except as specified in subsection (d), each cutoff collar shall meet all of the following design criteria:

(1) Be constructed of the same or similar material as that of the conduit;

(2) be attached to the conduit with a watertight seal;

(3) be of sufficient size and number to increase the length of the seepage path by at least 15 percent;

(4) be spaced at intervals of at least twice the vertical dimension of the largest collar being used;

(5) be located along the conduit in that portion of the dam that will be saturated;

(6) project a minimum of two feet beyond the outside wall of the conduit; and

(7) be located no closer than two feet from any conduit joint.

(d) If cutoff collars or a drainage diaphragm is located in a zoned fill, the location shall be justified in the design report and established in accordance with sound engineering principles and commonly accepted engineering practices.

(e) If another drain included in the design meets the requirements for a diaphragm in subsection (b), that other drain may be considered to be the diaphragm required by subsection (a).

(f) If the applicant desires to use any other type of seepage control, the applicant shall demonstrate to the chief engineer that the proposed type of seepage control protects the dam from seepage along the conduit and meets the requirements of sound engineering principles and commonly accepted engineering practices. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-55. Earthen auxiliary spillways. Each earthen auxiliary spillway shall meet all of the following requirements: (a) If the design discharge from the auxiliary spillway is directed so that the discharge impinges on the downstream toe of the dam, a wing dike shall be designed and constructed to direct spillway flows away from the downstream toe of the dam.

(b) If the auxiliary spillway is located on the embankment of the dam, adequate armor protection, including articulated blocks, concrete paving, gabion baskets underlain with properly designed bedding, or engineered riprap, shall be placed on the portion of the dam where the auxiliary spillway is located.

(c) The side slopes shall be no steeper than three horizontal units to one vertical unit, unless

the spillway is constructed through competent sandstone or limestone.

(d) There shall be at least a 30-foot level section immediately upstream of the control section. Immediately downstream of the control section, the slope of the spillway outlet shall be sufficient to ensure that flows at and above 50 percent of the design storm discharge will flow at a supercritical velocity.

(e) The auxiliary spillway shall be a minimum of three feet deep, as measured from the elevation of the control section to the design top of the dam.

(f) The entrance channel from the reservoir to the level section shall provide a smooth transition that prevents turbulent flow.

(g) The outlet channel shall convey flow to the receiving stream channel with a minimum of erosion.

(h) If a fish screen is installed, the screen shall not impair the functioning of the auxiliary spillway. If a fish screen is proposed, the design report shall demonstrate that the screen will not impair the functioning of the auxiliary spillway. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-56. Maximum design velocity for an auxiliary spillway. (a) The maximum velocity in feet per second during the design storm for water flowing in a vegetated earthen auxiliary spillway shall be determined from the following table:

	Slope of the exit channel			
Vegetation	**Erosion-resistant soils**		**Easily erodible soils**	
	0% to 5%	**5% to 10%**	**0% to 5%**	**5% to 10%**
Bermuda grass and Bahia grass	8	7	6	5
buffalo grass, Kentucky blue grass, smooth brome grass, tall fescue, and reed canary grass	7	6	5	4
sod-forming grass-legume mixtures	5	4	4	3
weeping love grass, yellow bluestem, and native grass mixtures	3.5	3.5	2.5	2.5

(b) The maximum design velocities specified in subsection (a) may be increased by not more than 10 percent if the design frequency of use of the auxiliary spillway is not more than two percent. The maximum design velocities may be increased by not more than 25 percent if the design frequency of use of the auxiliary spillway is not more than one percent.

(c) For exit channel slopes greater than 10 percent, the applicant shall provide analyses showing both of the following:

(1) There is no more than 0.5 foot of erosion depth within 20 feet of the control section for the one-percent chance storm.

(2) The auxiliary spillway does not fail by breaching during the spillway stability design event indicated in the following table:

Hazard class	Size class	Spillway stability design event
A	1, 2, or 3	0.3 PMP
A	4	0.4 PMP
B	1, 2, 3, or 4	0.5 PMP
C	1, 2, 3, or 4	PMP

(d) The provisions of paragraphs (c)(1) and (2) may be used for slopes of 10 percent or less in lieu of the maximum values specified in the table in subsection (a).

(e) The maximum allowable design velocity for water flowing over the following types of materials shall be determined from the following table:

Material	Maximum velocity allowed in feet per second
stratified rock	8.0
sound rock	13.0

(f) Channel lining materials not reliant on vegetation, including concrete, riprap, and grouted riprap, may be used if the applicant demonstrates that the lining will not fail during the spillway stability design event specified in paragraph (c)(2). (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-57. Service spillway design. (a) If a dam will have a service spillway, the spillway shall be designed and constructed with a lining material that meets the following requirements:

(1) Covers the channel floor and walls up to the

depth of flow required to bypass the flows of the storm specified as the detention requirement in K.A.R. 5-40-23(a), at a minimum; and

(2) will not fail during the spillway stability design event specified in K.A.R. 5-40-56(c)(2).

(b) Each design report required by K.A.R. 5-40-2b shall include all hydraulic, structural, and geotechnical design information necessary to show that the criteria in subsection (a) are met.

(c) If a fish screen is installed, the screen shall not impair the functioning of the service spillway. If a fish screen is proposed, the design report shall demonstrate that the screen will not impair the functioning of the service spillway. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-70. Construction notification to the chief engineer. Each holder of a permit to construct, or an approval to repair or modify a dam, shall notify the chief engineer at least 48 hours before any of the following stages of construction and shall obtain the approval of the chief engineer before proceeding with each of these stages of construction: (a) Starting construction;

(b) placing backfill in the cutoff trench;

(c) placing backfill around the primary spillway conduit or any other conduit that extends through the dam embankment and exits the downstream slope; and

(d) starting any stage of construction not specified in this regulation for which the permit requires that the chief engineer shall be notified. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-301a and 82a-303a; effective May 18, 2007.)

5-40-71. Inspection during dam construction, repair, and modification. (a) Except as specified in subsection (d), each high-impact dam shall be inspected by an engineer competent in the design of dams, or that engineer's authorized representative, at all times during any construction activity.

(b) Each low-impact dam shall be inspected by an engineer qualified in the design of dams, or that engineer's authorized representative, whenever any of the following conditions is met:

(1) Backfill is being placed in the cutoff trench of a dam.

(2) Conduits and their appurtenances are being placed.

(3) Backfill is being placed around a conduit.

(4) Drain material and outlets are being installed.

(5) Concrete forms and reinforcing steel are being placed.

(6) Concrete is being placed.

(7) Any other stage of construction required by the permit, approved plans, or approved specifications to be inspected occurs.

(c) Before the start of construction, the permit holder shall provide the chief engineer in writing with the name, address, and telephone number of the engineer responsible for the inspection.

(d) The inspecting engineer, or the engineer's authorized representative, shall not be required to be present during any of the following construction activities for a high-impact dam:

(1) The clearing and grubbing of the construction site;

(2) the removal of structures from the reservoir area other than the removal of a dam;

(3) the installation of pollution-control measures, unless required by other authorities;

(4) seeding;

(5) mulching; and

(6) the construction of a fence.

(e) If the inspecting engineer, or the engineer's authorized representative, observes construction activity that is not in compliance with the approved permit, plans, or specifications and the contractor fails to correct the item or items that are not in compliance with the approved permit, plans, or specifications after being notified by the inspector, the inspector shall notify the chief engineer of the noncompliant activity. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-301a and 82a-303a; effective May 18, 2007.)

5-40-72. Construction inspection reports. The engineer responsible for the inspection required by K.A.R. 5-40-71 shall, within 30 days of the completion of the construction, repair, or modification of the dam and its appurtenances, submit to the chief engineer an inspection report containing the following items: (a) A notice of completion showing the date on which construction, repair, or modification of the dam and its appurtenances was completed;

(b) a statement indicating one of the following:

(1) The dam and its appurtenances were constructed, repaired, or modified substantially in accordance with the permit and the approved plans and specifications; or

(2) the completed work varied from the permit and the approved plans and specifications. A description of each variation shall be provided;

(c) a final survey of the completed dam and its appurtenances, including the following:

(1) A profile of the top of the dam;

(2) a profile of the centerline of the auxiliary spillway or service spillway;

(3) a cross section at the control section of the auxiliary spillway or service spillway;

(4) a cross section of the dam at its deepest point;

(5) a cross section of the dam at the primary spillway if that section is not near the deepest section of the dam;

(6) the locations and elevations of the inlet and the outlet of the primary spillway;

(7) the location and elevation of each drain outlet; and

(8) the final elevation and coordinates of each permanent benchmark; and

(d) a summary or a copy of the daily inspection logs if required by the permit. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-301a and 82a-303a; effective May 18, 2007.)

5-40-73. Emergency action plan. (a) The owner of each hazard class B dam shall create an emergency action plan (EAP) on a form prescribed by the chief engineer. The owner shall keep the original EAP and submit a copy of the EAP to the chief engineer. The EAP shall address each of the following:

(1) A description of the dam, including the location of the dam and the access roads;

(2) the name, address, and telephone number of the person responsible for notifying local authorities of an emergency;

(3) a map or written description of the area that could be inundated by the type of breach described in K.A.R. 5-40-24;

(4) a list of persons who should be notified in case of an emergency, including the telephone numbers of those persons and their responsibilities; and

(5) the names, addresses, and telephone numbers of each owner of the dam and its appurtenances and those persons responsible for the operation and maintenance of the dam.

(b) Except as specified in subsection (d), the owner of a hazard class C dam shall create and maintain an emergency action plan that meets the recommendations of the "federal guidelines for dam safety: emergency action planning for dam owners," prepared by the interagency committee on dam safety and published by the federal emergency management agency, dated October 1998 and reprinted January 2004, which is hereby adopted by reference. The owner shall submit a copy of the EAP to the chief engineer.

(c) The owner of any dam for which an EAP is required under these regulations shall annually review the EAP to determine if it is still accurate and applicable to the current condition of the dam and current downstream conditions, including the following:

(1) The contact names and related information;

(2) the breach inundation map or a description of the inundation area; and

(3) emergency procedures.

If any material changes are made when updating the EAP, a copy of the revised EAP shall be submitted to the chief engineer.

(d) Any owner of a hazard class C dam may request that the chief engineer allow the owner to submit an EAP that meets only the requirements of subsection (a) in lieu of meeting the requirements of subsection (b). To make this request, the owner shall submit written justification of why an EAP meeting the requirements of subsection (a) is sufficient to protect the public safety. If the chief engineer approves the request, the chief engineer shall reserve the right to later impose the requirements of subsection (b) if downstream conditions change, the condition of the dam deteriorates, or the EAP does not adequately protect the public safety.

(e) The owner of a hazard class B dam shall submit the required EAP within 180 days of written notification by the chief engineer of the requirement.

(f) The owner of a hazard class C dam shall submit the required EAP within 180 days of written notification by the chief engineer that an EAP is required and that an adequate EAP is not on file in the chief engineer's office. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-73a. Discovery of an existing illegal, unpermitted dam. (a) Except when it is necessary to take additional actions to protect the public safety, when the chief engineer becomes aware of an existing illegal, unpermitted dam, the

following actions shall be taken by the chief engineer:

(1) Determine the hazard classification and condition of the dam;

(2) notify the owner of the dam of the following, in writing:

(A) The fact that the dam is illegal and unpermitted;

(B) the hazard classification of the dam;

(C) the fact that if the owner desires to keep the dam in existence, the owner shall submit a complete application for a permit for the dam pursuant to K.S.A. 82a-301 and K.S.A. 82a-302, and amendments thereto, within 120 days of the date of the chief engineer's notification;

(D) the condition that the application to obtain a permit for the dam shall meet the requirements of K.A.R. 5-40-8 and K.A.R. 5-40-74;

(E) the fact that failure to apply for a permit within 120 days shall result in the issuance of an order by the chief engineer requiring the owner to submit plans to breach or completely remove the dam; and

(F) the fact that the dam is subject to the provisions of this regulation.

(b)(1) If the owner submits an application for a permit within the time specified in paragraph (a)(2)(C), or within any extension of time authorized by the chief engineer in writing, the application shall meet the requirements of K.A.R. 5-40-8 and K.A.R. 5-40-74.

(2) If the owner fails to submit an application for a permit within the time specified in paragraph (a)(2)(C), or within any extension of time authorized by the chief engineer, an order requiring the owner to perform the following shall be issued by the chief engineer:

(A) Submit plans to breach or completely remove the dam; and

(B) bypass inflows and release water from storage so that no more than 15 acre-feet of water is kept in storage in the reservoir while the application for a permit to breach or completely remove the dam is being processed. The application for a permit shall contain all of the information required by K.A.R. 5-40-8 and any other information necessary to properly and safely design and complete the breach or removal. The application shall be submitted within 120 days of the date of the order, or within any extension of time authorized by the chief engineer. The owner shall be required to complete the breach or removal as permitted by the chief engineer within one year of the approval of a permit by the chief engineer, or any extension of time authorized by the chief engineer in writing.

(c) If the chief engineer dismisses an application for an existing illegal, unpermitted dam for any reason, the dismissal of the application shall be accompanied with an order requiring the dam to be breached or removed as provided in paragraph (b)(2).

(d) The order described in paragraph (b)(2) shall be filed by the chief engineer with the register of deeds for the county in which the dam is located.

(e) Each existing illegal, unpermitted dam of which the chief engineer becomes aware, either before or after the adoption of this regulation, shall be subject to this regulation. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-301, 82a-302, and 82a-303a; effective May 18, 2007.)

5-40-74. Design criteria for an existing illegal, unpermitted dam. (a) Except as specified in subsection (b), the design criteria specified in this subsection (a) shall be met to obtain a permit from the chief engineer pursuant to K.S.A. 82a-301 et seq., and amendments thereto, for an existing illegal, unpermitted hazard class A dam constructed before May 1, 1984 that has not been modified on or after May 1, 1984. The applicant shall have an engineer who is qualified in dam design and construction conduct an inspection of the dam and prepare a report that includes all of the following:

(1) The date of the inspection and a list of the members of the inspection team;

(2) color photographs documenting the condition of the dam's appurtenances and embankment and any observed deficiencies in the appurtenances and embankment;

(3) a plan view sketch of the dam and its immediate vicinity showing the location from which each photograph was taken and the direction in which it was taken;

(4) a description of the physical condition of the dam and its appurtenances, a list of the deficiencies that were observed, and a description of the severity of each observed deficiency. All deficiencies that may threaten the structural integrity of the dam shall be shown; and

(5) a survey of the dam, documented by a plan view of the dam and cross section drawings, including the following:

(A) Cross sections of the embankment every 200 feet, with each cross section starting from the upstream toe of the dam or the water surface on the upstream side to the toe of the dam on the downstream side of the dam;

(B) a profile of each open-channel spillway from the water surface on the upstream side of the dam to the point where spillway flows enter the receiving stream;

(C) a cross section of each open-channel spillway every 200 feet and at each control section, with a minimum of two cross sections;

(D) the elevation of each primary spillway inlet and outlet;

(E) the elevation of the flow line of the outlet channel; and

(F) the dimensions, locations, and descriptions of materials, workmanship, condition, apparent purpose for, and any other relevant information about all visible appurtenances in sufficient detail to represent the appurtenances in three dimensions;

(6) the dimensions and location of each deficiency noted as required in paragraph (a)(4);

(7) the estimated rate and color of discharge from drain outlets and any seeps;

(8) a determination of the hazard classification of the dam as specified in K.A.R. 5-40-24;

(9)(A) A description of the drawdown valve, if any;

(B) specification of whether the valve was operated during the inspection; and

(C) if the valve could not be operated, an explanation of why it could not be operated;

(10) the name, mailing address, and telephone number of the engineer who conducted the inspection;

(11) the name, mailing address, and telephone number of each current owner of the dam; and

(12) any other information relevant to the safety and integrity of the dam, including any items requested by the chief engineer before the inspection.

(b) If the applicant provides construction plans prepared before construction that show how the dam was to be constructed or modified and that reflect the actual dimensions of the dam as it exists, those plans may be substituted for the survey required in paragraph (a)(5).

(c) If the chief engineer determines from the inspection report that the dam does not pose a threat to public safety or public or private property and that the condition of the dam is sound, an after-the-fact permit may be issued by the chief engineer pursuant to K.S.A. 82a-301 et seq., and amendments thereto.

(d)(1) In order for an existing illegal, unpermitted hazard class A dam constructed or modified on or after May 1, 1984 or an existing illegal, unpermitted hazard class B or C dam to receive a permit from the chief engineer pursuant to K.S.A. 82a-301 et seq. and amendments thereto, the applicant shall demonstrate that the dam meets all of the applicable statutory and regulatory requirements in effect when the application for the permit is filed. The applicant shall provide a survey meeting the requirements of paragraph (a)(5) and a design report that meets the requirements of K.A.R. 5-40-2b. If plans are available that show how the dam was constructed or modified and those plans reflect the actual dimensions of the dam as it exists when the application is filed, the plans may be substituted for the required survey. If a geologic investigation was conducted before construction of the dam and the results of that investigation are available, that investigation may be substituted for the investigation and report required by K.A.R. 5-40-40 through K.A.R. 5-40-42.

(2) If the applicant cannot determine that the chief engineer's requirements for the following design or actual construction properties were met without significantly disturbing the embankment but the applicant demonstrates that the dam was built in a manner appropriate to the standards in effect when the dam was constructed, then a permit may be issued if the chief engineer determines that the dam does not pose a hazard to public safety:

(A) The location, dimensions, and composition of the backfill materials to fill the cutoff trench;

(B) the location, dimensions, and construction of cutoff collars, drains, or other seepage control;

(C) the allowance for settlement of an earthen dam;

(D) specification of whether the primary spillway pipe was tested;

(E) the specifications used; and

(F) documentation of any construction inspections. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-301a, 82a-302, and 82a-303a; effective May 18, 2007.)

5-40-75. Maintenance of dams. Each owner of a dam that the chief engineer has authority to regulate pursuant to K.S.A. 82a-301 et seq., and amendments thereto, shall operate and

maintain the dam in a manner that protects the public safety, complies with the terms of any permit of the chief engineer, and ensures the integrity of the dam. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-301a and 82a-303a; effective May 18, 2007.)

5-40-76. Repair or modification of a permitted or prejurisdictional dam. (a) The repair or modification of a permitted or prejurisdictional dam shall meet the requirements of both of the following:

(1) The statutes and the regulations in effect when the application for repair or modification is filed; and

(2) any additional criteria specified by the chief engineer that are necessary to ensure the integrity of the dam and its appurtenances.

(b) At the time of the repair or modification, the applicant shall bring the dam and all of its appurtenances into conformance with the requirements of the statutes and regulations in effect at the time of the application for repair or modification, unless both of the following conditions are met:

(1) The applicant demonstrates that bringing any feature of the dam and its appurtenances into compliance is not feasible or is unduly burdensome.

(2) The chief engineer determines that failing to bring any feature of the dam into compliance with one or more requirements applicable to that feature will not significantly affect the public safety.

(c) Each application to repair or modify a dam or its appurtenances shall include a design report on the repair or modification, including a section describing the condition of the dam at the time of the application. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-77. Easements for dams. (a) Each applicant that applies for a permit to construct a dam, modify a dam in a manner that will raise the top of the dam, or modify the dam in any other way that will increase the backwater effect of the dam or the flow of water from the dam to the receiving stream shall demonstrate either of the following to the chief engineer:

(1) The applicant owns the site of the dam and appurtenant works, the land that will be inundated, and the land over which discharge from the dam's spillways will flow.

(2) The applicant has easements or other legal authority to perform the following for the design life of the dam:

(A) Construct and maintain the dam;

(B) inundate all of the land upstream from the dam to the top of the dam elevation; and

(C) discharge water from the spillways to a stream channel and the associated floodplain adequate to convey the discharge from the design storm.

(b) For permitted dams for which a modification is proposed, an easement or other legal authority shall be required only for the effects caused by the modification. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302, K.S.A. 82a-303, and K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

5-40-90. Requirements for a dam safety inspection report. Each dam safety inspection report required by K.S.A. 82a-303b, and amendments thereto, shall document the observations made during the inspection and the engineer's opinion of the condition of the dam and shall include all of the following:

(a) An executive summary briefly describing the overall condition of the dam as found during the inspection;

(b) the date of the inspection and a list of the members of the inspection team;

(c) color photographs documenting the condition of the dam appurtenances and embankment and any observed deficiencies in the appurtenances and embankment;

(d) a plan view sketch of the dam and the vicinity, showing the location where each photograph was taken and the direction in which the photograph was taken;

(e) a description of the physical condition of the dam and its appurtenances, a list of any deficiencies that were observed, and a plan view sketch of the dam and its appurtenances showing the location of those deficiencies. The deficiencies that shall be shown shall include those that meet any of the following conditions:

(1) Violate the permit or approved plans or any approved modifications of the permit or approved plans;

(2) threaten the structural integrity of the dam; or

(3) threaten the safety of people or property above or below the dam;

(f) survey and other documenting data if the

engineer observes any changes from previously documented conditions in the dam or its appurtenances that could jeopardize the integrity of the dam, including any changes in the profile or cross section of the dam, profile, or cross section of any open-channel spillway, and areas of settlement or erosion;

(g) a description of the severity of each observed deficiency and the engineer's opinion about the urgency of remedying each deficiency;

(h) a summary of the engineer's review of the adequacy of the emergency action plan, including a review of any updates since the last inspection;

(i) the estimated rate and color of discharge from drain outlets and any seeps;

(j) a statement indicating whether the engineer agrees or disagrees with the hazard classification of the dam, including the reasons why the engineer agrees or disagrees with that classification;

(k) a map drawn to a scale of 1:24,000 or larger showing the location of any hazards added, removed, or not previously shown downstream of the dam, in addition to those identified in previous reports, that would require a modification of the emergency action plan or might change the hazard classification of the dam;

(l) any significant changes in the capacity of the reservoir;

(m) any significant changes in the capacity of any spillway;

(n) a statement indicating whether there have been any significant changes in the watershed and an estimate of the impact of those changes on the design hydrology;

(o) the name, mailing address, and telephone number of the engineer;

(p) the name, mailing address, and telephone number of each current owner of the dam;

(q) observations or readings from all instrumentation required by the permit, the approved plans, the approved specifications, or the chief engineer;

(r)(1) A description of the drawdown valve, if any; and

(2) specification of whether the drawdown valve was operated during the inspection and, if the valve could not be operated, an explanation of why it could not be operated; and

(s) any other information relevant to the safety of the dam, including any items requested by the chief engineer before the inspection. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-303a and 82a-303b; effective May 18, 2007.)

5-40-91. Schedule for inspection of hazard class C dams. Each hazard class C dam shall be inspected every third inspection year after the inspection year in which the initial inspection was completed. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-303a and 82a-303b; effective May 18, 2007.)

5-40-92. Schedule for inspection of hazard class B dams. Each hazard class B dam shall be inspected every fifth inspection year after its initial inspection. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-303a and 82a-303b; effective May 18, 2007.)

5-40-93. Schedule for inspection of dams. The initial and follow-up dam safety inspections required by K.S.A. 82a-303b, and amendments thereto, for any dam completed on or after July 1, 2002, shall be conducted and a report shall be filed with the chief engineer in accordance with the following schedule: (a) Each permitted hazard class C dam shall be inspected in the third inspection year after the inspection year in which the dam is completed and every third inspection year thereafter.

(b) Each permitted hazard class B dam shall be inspected in the fifth inspection year after the inspection year in which the dam is completed and every fifth inspection year thereafter.

(c) Each unpermitted class B or class C hazard dam completed on or after July 1, 2002, shall be inspected in accordance with a schedule approved by the chief engineer as necessary to protect the public safety.

(d) Each dam that had its hazard class increased by the chief engineer on or after July 1, 2002, shall initially be inspected by the chief engineer in the inspection year in which the hazard class is increased.

(e) If the dam was reclassified as a hazard class B dam, the dam shall be inspected every fifth inspection year after the inspection year in which the hazard class was changed.

(f) If the dam was reclassified as a hazard C dam, the dam shall be inspected every third inspection year after the inspection year in which the hazard class was changed. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-303a and 82a-303b; effective May 18, 2007.)

5-40-94. Revision of schedule of inspections. For good cause shown, including a change

in hazard class or repair or modification of a dam, the dam safety inspection schedule may be revised by the chief engineer and a new inspection cycle may be started. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-303a and 82a-303b; effective May 18, 2007.)

5-40-100. Request to be included on the list of independent engineers qualified to review applications. (a) Each licensed professional engineer who desires to be placed on the list of licensed professional engineers approved to review applications for the permit required by K.S.A. 82a-301 et seq., and amendments thereto, shall submit a request to the chief engineer on a form prescribed by the chief engineer.

(b) Any engineer may request approval in one or more of the following areas:

(1) Dam design;

(2) channel design; and

(3) the design of stream obstructions other than dams.

(c) A team of persons may be qualified to be a reviewer for a project. The qualifications of each team member shall be submitted, and one person shall be designated as the supervising reviewer. The supervising reviewer shall meet the minimum requirements for an individual reviewer. The other members of the review team shall not be required to meet the minimum requirements for an individual reviewer. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-101. Information to be submitted with a request to be a reviewer. (a) Each engineer who wants to be included on the list of licensed professional engineers approved to review applications under the obstructions in streams act, as authorized by K.S.A. 82a-302, and amendments thereto, shall submit that request on a form prescribed by the chief engineer and shall designate each area of review for which the engineer or a team of engineers desires to be approved.

(b) All of the following information shall be included on each request for each area in which the engineer seeks to be approved:

(1) The type and license number of each current license from the Kansas state board of technical professions;

(2) relevant education, including graduate and postgraduate schools attended, degrees received, and professional development work; and

(3) work experience in the requested area of expertise, including the following:

(A) The number of years of experience as an engineering intern;

(B) the number of years of experience as an engineer; and

(C) the approximate number of projects for which the engineer met the following criteria:

(i) Was responsible for the project;

(ii) performed substantive design tasks;

(iii) had quality assurance, quality control, or project review responsibilities; and

(iv) performed construction supervision or inspection; and

(D) the project name, the location, a brief description of the project, and a brief description of the engineer's responsibilities for one or two projects for which the engineer met the following criteria:

(i) Had responsible charge or performed significant portions of the design; or

(ii) provided quality control, quality assurance, project review, construction supervision, or construction inspection duties. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-102. Minimum requirements to be an individual reviewer. To be an individual reviewer, each person shall meet both of the following qualifications: (a) Have a current professional engineer's license from the Kansas state board of technical professions; and

(b) have a minimum of five years of relevant work experience in the area for which approval is sought. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-103. Conflict of interest. A reviewer shall not be eligible to review any of the following: (a) Any project in which the reviewer has participated in the project's design in any way;

(b) any project designed by any other employee of the reviewer's current employer; or

(c) any other project for which the reviewer has a conflict of interest with the owner of the dam, the designer of the dam, or the state of Kansas. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-104. Notification of approval or disapproval to be a reviewer. Within 60 days of the receipt in the office of the chief engineer of a completed request pursuant to K.A.R. 5-40-101, the requester shall be notified by the chief engineer of whether that individual has been approved in each requested area. If the chief engineer has not approved the request for each area of review requested, the requester shall be notified by the chief engineer of the reason or reasons that each request has been denied. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-105. Procedure for independent review of an application to construct a dam or other water obstruction. (a) When an applicant provides a copy of that individual's application to an approved reviewer pursuant to K.S.A. 82a-302 and amendments thereto, the applicant shall also submit the following to the chief engineer:

(1) The original application;

(2) all documentation required for an acceptable application as specified in K.A.R. 5-40-8;

(3) the statutorily required filing fee; and

(4) the name, address, and telephone number of the reviewer.

(b) The review required by the water projects environmental coordination act, K.S.A. 82a-325 et seq. and amendments thereto, shall be initiated by the chief engineer after the chief engineer receives the application.

(c) Within 37 days after the review specified in subsection (b) is initiated by the chief engineer, any comments received from the environmental review agencies shall be sent by the chief engineer to the reviewer. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

5-40-106. Report of findings of independent reviewer. (a) When a reviewer completes the review of an application pursuant to K.S.A. 82a-302 and amendments thereto, the reviewer shall submit a report of that review to the chief engineer. The report shall be properly sealed by the reviewing engineer as directed by the Kansas state board of technical professions.

(b) Each complete report shall include the following:

(1) An opinion as to whether the application meets the requirements of K.S.A. 82a-301 et seq., and amendments thereto, the regulations that implement these statutes, sound engineering principles, and commonly accepted engineering practices;

(2) the basis for that opinion, including any analyses that were performed, and the supporting data;

(3) an evaluation of the comments from the environmental review agencies that were furnished to the reviewer by the chief engineer and a recommendation about how to address all adverse comments;

(4) a recommendation about whether any request by the applicant to waive one or more regulations should be approved and the basis for approving or denying the waiver; and

(5) a recommendation about whether the chief engineer should approve or deny the permit and any conditions that the chief engineer should impose on the permit.

(c) The recommendations shall not be binding on the chief engineer. The chief engineer shall maintain the final authority to approve or deny all applications. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-302 and 82a-303a; effective May 18, 2007.)

Article 42.—DESIGN OF STREAM OBSTRUCTIONS

5-42-1. Stream obstructions; plans and specifications. (a) The plans required for a permit for a stream obstruction pursuant to K.S.A. 82a-301, and amendments thereto, shall include the following:

(1) A general location map or aerial photograph showing the stream, location of the proposed obstruction, sufficient detail to locate the proposed construction site, section lines, a bar scale, a north arrow, property lines with the names and addresses of adjoining landowners and any other landowners whose land may be hydraulically affected by the proposed stream obstruction, drainage area, and any other prominent features;

(2) a detailed plan view fully describing the obstruction and the site;

(3) the following topographical information, which shall be provided from streambed elevation to the limits specified in subsection (b):

(A) A profile of the streambed and both banks;

(B) a contour map with a contour interval of no more than two feet; or

(C) cross sections perpendicular to the stream

and at intervals of no more than five times the width of the channel;

(4) an elevation view showing the obstruction on a cross section of the stream and the valley up to the post project design flood elevation at the site;

(5) at least one permanent benchmark shall be conveniently located for use after construction. The location, description, and elevation of the permanent benchmark to which all elevations are referred shall be shown on the plans. Reference to the national geodetic vertical datum of 1988, or other acceptable national vertical datum, to a tolerance of plus or minus one-half foot shall be required for all stream obstructions on perennial streams and all other streams where base flood elevations have been determined and are shown on flood insurance rate maps. An assumed project datum shall be acceptable on all other stream obstruction projects;

(6) details of the manner in which the obstruction is to be tied into the bed and banks of the streams;

(7) the land for which easements or rights-of-way are to be acquired if the proposed obstruction affects land other than that owned by the applicant; and

(8) unless it is clear that the impact of the proposed project will be contained within the channel or limited to property under the control of the applicant, a hydraulic analysis determining the preproject and postproject water surface elevations for the 50 percent-chance flood and the one percent-chance flood shall be prepared and submitted to the chief engineer.

(b)(1) If it is clear that the impact of the proposed stream obstruction will be contained within the channel or limited to property under the control of the applicant, the topographical information upstream of the stream obstruction required in paragraph (a)(3) shall be required to either of the following, whichever is lower:

(A) The elevation of the highest point on the proposed obstruction; or

(B) the elevation of the one percent-chance flood water surface.

The applicant shall not be required to show topographical information for any property not under the control of the applicant.

(2) If it is not clear that the impact of the proposed project will be contained within the channel or limited to property under the control of the applicant, the topographical information upstream of the stream obstruction required in paragraph (a)(3) shall be provided from streambed elevation up to the elevation of the one percent-chance flood water surface upstream of the stream obstruction.

(3) The topographical information required in paragraph (a)(3) and subsection (b) shall be provided downstream of each proposed stream obstruction for a distance equal to five times the width of the channel at the proposed site of the stream obstruction or 50 feet downstream from the toe of the stream obstruction, whichever is greater.

(c) Each application for a permit to construct a stream obstruction shall include the following specifications:

(1) Each major element in the construction of the obstruction;

(2) the minimum quality of workmanship that is acceptable to construct the obstruction;

(3) the minimum quality of materials that is acceptable to construct the obstruction; and

(4) the materials proposed to be used to construct the obstruction.

(d) The specifications shall meet the following requirements:

(1) Be clear, legible, and shown in sufficient detail to assure that the work can be properly constructed; and

(2) be shown on the plans, in the design report, or on a separate document.

(e) If the Kansas department of transportation (KDOT) standard construction specifications meet all of the requirements of this regulation and are to be enforced during construction, referencing those specifications on the plans shall be sufficient to comply with this regulation.

(f) If the standard construction specifications of a city or county in Kansas meet the following requirements, then referencing those specifications on the plans shall be sufficient to comply with this regulation:

(1) Meet all the requirements of this regulation;

(2) are to be enforced during construction; and

(3)(A) Have been provided to the chief engineer; or

(B) are readily available at no cost from the city or county that utilizes the specifications. (Authorized by K.S.A. 2006 Supp. 82a-303a; implementing K.S.A. 2006 Supp. 82a-301, 82a-302, and 82a-303a; effective May 1, 1987; amended, T-5-12-30-91, Dec. 30, 1991; amended April 27, 1992; amended May 18, 2007.)

5-42-5. Determining the peak discharge of a one percent-chance storm. In determining the flow magnitude of a design storm, the applicant shall use one of the following methods. (a) For drainage areas of less than 640 acres, use of the rational formula shall be acceptable.

The rational formula is Q = CIA

Where C = the runoff coefficient

I = the intensity of rainfall, in inches per hour

A = the drainage area, in acres.

(b) For any drainage area, the flow magnitude of a design storm may be determined by using one of the methods in the following:

(1) "Estimation of peak streamflows for unregulated rural streams in Kansas," water-resources investigations report 00-4079, published by the United States geological survey in 2000, which is hereby adopted by reference;

(2) "urban hydrology for small watersheds," technical release 55, published by the natural resources conservation service and dated June 1986, which is hereby adopted by reference; and

(3) "computer program for project formulation," technical release 20, published by the natural resources conservation service, United States department of agriculture, and dated October 2004, which is hereby adopted by reference.

(c) For streams for which sufficient stream gaging data is available, the applicant may use sound engineering principles and commonly accepted engineering practices to estimate the peak one percent-chance discharge from the gage record.

(d) A method other than the methods specified in subsections (a), (b), and (c) may be used to determine the one percent-chance storm discharge if the method meets both of the following criteria:

(1) The method is based on sound engineering principles and commonly accepted engineering practices.

(2) The method has been previously approved, in writing, by the chief engineer. (Authorized by and implementing K.S.A. 2006 Supp. 82a-303a; effective May 18, 2007.)

Article 44.—FLOODPLAIN MANAGEMENT

5-44-7. Certification of elevations. Any elevation required to be certified to meet the requirements of this article of regulations may be certified by either a licensed land surveyor or a licensed professional engineer. (Authorized by and implementing K.S.A. 2006 Supp. 12-766; effective May 18, 2007.)

Article 1.—DEFINITIONS

5-1-1. Definitions. As used in these regulations and the Kansas water appropriation act, and by the division of water resources in the administration of the Kansas water appropriation act, unless the context clearly requires otherwise, the following words and phrases shall have the meanings ascribed to them in this regulation.

(a) "Above-baseflow stage" means streamflow that is in response to a significant runoff event during which period the water level elevation of the stream is greater than the elevation of the adjacent water table.

(b) "Acceptable quality surface water" means surface water that will not degrade the quality of the groundwater source into which it is discharged.

(c) "Application" means the formal document submitted on the form prescribed by the chief engineer for a permit to appropriate water for beneficial use and filed in the office of the chief engineer as provided by K.S.A. 82a-708a and 82a-709, and amendments thereto.

(d) "Approval of application" means a permit to proceed with construction of diversion works and the diversion and use of water in accordance with the terms and conditions set forth in the permit. Approval of application shall not constitute any permit that may be required by other state laws.

(e) "Aquifer storage" means the act of storing water in the unsaturated portion of an aquifer by artificial recharge for subsequent diversion and beneficial use.

(f) "Aquifer storage and recovery system" means the physical infrastructure that meets the following conditions:

(1) Is constructed and operated for artificial recharge, storage, and recovery of source water; and

(2) consists of apparatus for diversion, treatment, recharge, storage, extraction, and distribution.

(g) "Artificial recharge" means the use of source water to artificially replenish the water supply in an aquifer.

(h) "Authorized representative" means any staff employee designated by the chief engineer to perform duties and functions on behalf of the chief engineer.

(i) "Bank storage" means water absorbed by and temporarily stored in the banks and bed of a stream during above-baseflow stage.

(j) "Bank storage well" means a well used to divert or withdraw water from bank storage.

(k) "Basin storage area" means the portion of the aquifer's unsaturated zone used for aquifer storage that has defined horizontal boundaries and is delimited by the highest and lowest index water level elevations.

(l) "Basin storage loss" means that portion of artificial recharge naturally flowing or discharging from the basin storage area.

(m) "Basin term permit" means a term permit to appropriate surface water from a stream within a specific drainage basin, or a portion of it, for a reasonable quantity of water, not to exceed a maximum of 100 acre-feet per calendar year, for use in either of the following:

(1) Drilling oil and gas wells; or

(2) construction projects within the specified basin.

(n) "Battery of wells" means two or more wells connected to a common pump by a manifold, or not more than four wells in the same local source of supply within a 300-foot-radius circle that are being operated by pumps not to exceed a total maximum rate of diversion of 800 gallons per minute and that supply water to a common distribution system.

(o) "Beneficial uses of water" are the following:

(1) Domestic uses;

(2) stockwatering;

(3) municipal uses;

(4) irrigation;

(5) industrial uses;

(6) recreational uses;

(7) waterpower;

(8) artificial recharge;

(9) hydraulic dredging;

(10) contamination remediation;

(11) dewatering;

(12) fire protection;

(13) thermal exchange; and

(14) sediment control in a reservoir.

(p) "Complete and accurate water use report" means a water use report that the water right owner has filed pursuant to K.S.A. 82a-732, and amendments thereto, that provided all of the information required on the form prescribed by the chief engineer, including the following:

(1) The quantity of water diverted during the calendar year;

(2) if the diversion of water was required to be metered during the calendar year for which the

report is being filed, the information required by K.A.R. 5-3-5e;

(3) if the water was used for irrigation purposes, the number of acres that were irrigated; and

(4) if the water was diverted from a sand and gravel pit operation, the size of the surface area of the pit in acres at the end of the calendar year for which the report was filed.

(q) "Completed substantially as shown on aerial photograph, topographic map, or plat," as used to define the authorized point of diversion, means within 300 feet of the location as shown on the aerial photograph, topographic map, or plat accompanying the application.

(r) "Confined Dakota aquifer system" means that portion of the Dakota aquifer system overlain by Graneros shale.

(s) "Conjunctive use" means the safe-yield management and operation of an aquifer in coordination with a surface water system to enhance the use of the total water supply availability in accordance with the provisions of the water appropriation act.

(t) "Contamination remediation" means the diversion of water by a state agency, or under a written agreement or order of an appropriate state agency, for the purpose of improving the water quality.

(u) "Dakota aquifer system" shall include the Dakota formation, the Kiowa formation, the Cheyenne sandstone, and, where hydraulically connected, the Morrison formation.

(v) "Dakota aquifer system well" means a well or proposed well screened in whole or in part in the Dakota aquifer system.

(w) "Dam" means any artificial barrier, together with all appurtenant works, that does or could impound water.

(x) "Dewatering" means the removal of surface water or groundwater to achieve either of the following:

(1) Facilitate the construction of a building, pipeline, or other facility; or

(2) protect a building, levee, mining activity, or other facility.

(y) "Direct diversion of surface water" means the diversion of surface water directly from a stream by means of a pump, headgate, siphon, or similar installation, for application to beneficial use without storing it behind a dam, levee, or similar type of structure.

(z) "Diversion" means the act of bringing water under control by means of a well, pump, dam, or other device for delivery and distribution for the proposed use.

(aa) "Diversion works" means any well, pump, power unit, power source, dam, and any other devices necessary to bring water under control for delivery to a distribution system by which the water will be distributed to the proposed use and any other equipment required as a condition of the permit, including a check valve, water level measurement tube, meter, or other measuring device.

(bb) "Division" means the division of water resources of the Kansas department of agriculture.

(cc) "Dry hydrant" means a permanent, unpressurized intake pipe used to remove water from a pond, stream, reservoir, or other surface water supply by means of suction or vacuum supplied by a fire truck or other portable pumping device.

(dd) "Field inspection" means that for the purpose of issuing a certificate of appropriation pursuant to K.S.A. 82a-714 and amendments thereto, the chief engineer conducts a test of the rate of diversion of the diversion works under the normal and maximum conditions that the diversion works actually applied water to beneficial use during the perfection period. The chief engineer also collects all other information necessary to prepare a certificate, including the following:

(1) A description of the location and size of the place where water was actually applied to beneficial use during the perfection period in accordance with the terms, conditions, and limitations of the approval of application;

(2) information on the quantity and rate of water that was applied to the authorized use during the perfection period; and

(3) the actual location of the point or points of diversion from which water was diverted in accordance with the terms, conditions, and limitations of the approval of application.

(ee) "Fire protection" means the use of water for fire protection by a fire department for public protection in general.

(ff) "Fish farming" means the controlled cultivation and harvest of aquatic animals.

(gg) "Flow-straightening vanes" means vanes, or other device installed at the upstream throat of a measuring chamber for the purpose of aligning all velocity components of flow parallel with the flow in the measuring chamber at the water flowmeter sensor location.

(hh) "Full irrigation" means the application of water to crops during the growing season. Full irrigation shall include water for preirrigation.

(ii) "Groundwater" means water below the surface of the earth.

(jj) "Growing season" means the average frost-free period of the year.

(kk) "Household purposes" means the use of water by a person for cooking, cleaning, washing, bathing, human consumption, rest room facilities, fire protection, and other uses normally associated with the operation of a household.

(1) "Fire protection" shall be considered to be use of water for "household purposes" if either of the following conditions is met:

(A) Water is available from a "dry hydrant" that has been installed on a pond located within 1,000 feet of the residence.

(B) Water can be pumped from a well located within 1,000 feet of the residence for fire protection.

(2) Household purposes shall also include the replacement of the potential net evaporation from a domestic pond of up to ½ acre in surface area if both of the following conditions are met:

(A) The pond is utilized for aesthetic purposes as an integral part of the landscaping of a house.

(B) Any portion of the pond is located within 300 feet of the closest edge of the house.

(3) The maximum reasonable annual quantity of groundwater that may be pumped into a pond to be withdrawn later for domestic fire protection shall not exceed 0.06 acre-feet plus the average annual potential net evaporation for a pond at that location in the state having a surface area of 0.2 of an acre.

(4) Household purposes shall also include the use of 1½ acre-feet of water or less per calendar year by an industrial user, restaurant, hotel, motel, church, camp, correctional facility, educational institution, or similar entity for household purposes.

(ll) "Hydraulic dredging" means the removal of saturated aggregate from a stream channel, pit, or quarry by means of hydraulic suction and the pumping of the aggregate and water mixture as a slurry to a location where at least 95% of the water returns directly to the source of supply.

(mm) "Immediate vicinity," as used in specifying the place of use for a water right in which the water is authorized to be used for municipal purposes, means within 2,640 feet of the corporate limits of the municipality, rural water district, or other entity.

(nn) "In compliance" means that a water flowmeter does not meet any of the criteria of K.A.R. 5-1-9 for being out of compliance.

(oo) "Index water level" means water level elevations established spatially throughout a basin storage area to be used to represent the maximum volume of a basin storage area, and storage available for recovery based upon accounting methodology, and conditions of the permit.

(pp) "Indirect use" means the total of the seepage loss and the average annual potential net evaporation loss from the surface of water originally impounded in a reservoir for beneficial use.

(qq) "Industrial use" means the use of water in connection with the manufacture, production, transport, or storage of products, or the use of water in connection with providing commercial services, including water used in connection with steam electric power plants, greenhouses, fish farms, poultry operations that are not incidental to the operation of a traditional farmstead pursuant to K.S.A. 82a-701(c) and amendments thereto, secondary and tertiary oil recovery, air conditioning, heat pumps, equipment cooling, and all uses of water associated with the removal of aggregate for commercial purposes except the following:

(1) The evaporation caused by exposing the groundwater table or increasing the surface area of a stream, lake, pit, or quarry by excavation or dredging, unless the evaporation has a substantially adverse impact on the area groundwater supply; and

(2) hydraulic dredging.

(rr) "Irrigation use" means the use of water for the following:

(1) The growing of crops;

(2) the watering of gardens, orchards, and lawns exceeding two acres in area; and

(3) the watering of golf courses, parks, cemeteries, athletic fields, racetrack grounds, and similar facilities.

(ss) "Measuring chamber" means a cylindrical chamber in which a water flowmeter is installed that is calibrated to match the measuring element of the water flowmeter and the nominal size of the pipe in which it is installed.

(tt) "Municipal use" means the various uses made of water delivered through a common distribution system operated by any of the following:

(1) A municipality;

(2) a rural water district;

(3) a water district;

(4) a public wholesale water supply district;

(5) any person or entity serving 10 or more hookups for residences or mobile homes; or

(6) any other similar entity distributing water to other water users for various purposes.

Municipal use shall also include the use of water by restaurants, hotels, motels, churches, camps, correctional facilities, educational institutions, and similar entities using water that does not qualify as a domestic use.

(uu) "Nonvolatile memory" means the ability of a water flowmeter to retain the values stored in the mechanical or electronic memory if all power, including backup battery power, is removed.

(vv) "Normal operating range" means the range of flow rates for which the water flowmeter will meet the accuracy requirements of K.A.R. 5-1-4 (a), as certified by the water flowmeter manufacturer.

(ww) "Off-season irrigation" means the application of water to land for the purpose of storing moisture in the soil for future use by a crop that will not be irrigated during the growing season.

(xx) "Operator," as used in the regulation of sand and gravel pits, means any person who engages in mining sand or gravel, or both.

(yy) "Perfect" means the actions taken by a water user to develop an approval of application into a water right. These actions shall consist of the completion of the diversion works and the actual application of water to the authorized beneficial use in accordance with the terms, conditions, and limitations of the approval of application.

(zz) "Point of diversion" means the point at which water is diverted or withdrawn from a source of water supply.

(aaa) "Point of diversion for storage of surface water in a reservoir created by a dam" means the point at which the longitudinal axis of the dam crosses the centerline of the stream impounded by the reservoir.

(bbb) "Potential annual runoff" means the mean annual runoff for the watershed of the reservoir.

(ccc) "Preirrigation" means the application of water to the land for a crop before planting to ensure adequate moisture for early plant growth.

(ddd) "Primary well" means a well for which a standby well is available.

(eee) "Prior right" means a vested right, an appropriation right with earlier priority, or a permit with earlier priority than that of a subsequent appropriation right or permit.

(fff) "Proven reserves" means extractable sand and gravel deposits for which good estimates of the quantity and quality have been made by various means, including core drilling.

(ggg) "Recharge" means the natural infiltration of surface water or rainfall into an aquifer from its catchment area.

(hhh) "Recharge credit" means the quantity of water that is stored in the basin storage area and that is available for subsequent appropriation for beneficial use by the operator of the aquifer storage and recovery system.

(iii) "Recreation storage" means the storage and use of water within the reservoir for recreational use as defined in this regulation. Water stored for recreation use in a reservoir shall be considered to be an indirect use of water.

(jjj) "Recreational use" means a use of water in accordance with a water right that provides entertainment, enjoyment, relaxation, and fish and wildlife benefits.

(kkk) "Rediversion of water" means releasing or withdrawing water that had been previously impounded behind a dam, levee, or similar type of structure, by use of a pump, outlet tube, headgate, or similar type of device, and the application of the water directly to beneficial use.

(lll) "Register" means an integral or remote device that displays the quantity of water passing the water flowmeter sensor and is part of the water flowmeter.

(mmm) "Reservoir" means the area upstream from a dam that contains, or will contain, impounded water.

(nnn) "Reservoir capacity" means the volume of water that can be stored below the lower of either of the following:

(1) The elevation of the principal spillway tube; or

(2) the lowest uncontrolled spillway in the reservoir.

(ooo) "Reservoir having a total water volume of less than 15 acre-feet," as used in K.S.A. 82a-728 and amendments thereto, means a reservoir having a capacity of 15 acre-feet or less as measured at the principal spillway tube or the lowest uncontrolled spillway, whichever is lower.

(ppp) "Safe yield" means the long-term sustainable yield of the source of supply, including hydraulically connected surface water or groundwater.

(qqq) "Sand and gravel pit operation" means a project that meets the following conditions:

(1) Excavates overburden for mining sand or

gravel, or both, exposing the underlying groundwater table to evaporation; and

(2) has a perimeter equal to or greater than its depth.

(rrr) "Sediment control in a reservoir" means a beneficial use of water that meets both of the following criteria:

(1) The water is stored in a reservoir that has no other authorized type of beneficial use, except domestic use.

(2) The water is stored only in the part of the reservoir designed and constructed for the storage of sediment.

(sss) "Source water" means water used for artificial recharge that meets the following conditions:

(1) Is available for appropriation for beneficial use;

(2) is above base-flow stage in the stream;

(3) is not needed to satisfy minimum desirable streamflow requirements; and

(4) will not degrade the ambient groundwater quality in the basin storage area.

(ttt) "Specialty crop" means a crop other than a normal Kansas field crop. This term shall include turf grass, trees, vegetables, ornamentals, and other similar crops.

(uuu) "Standby well" means a well that can withdraw water from the same source of supply as the primary well and that is used only when water is temporarily unavailable from the primary well or wells authorized to be used on the same place of use because of mechanical failure, maintenance, or power failure. A standby well may also be used for fire protection or a similar type of emergency.

(vvv) "Static water level" means the depth below land surface at which the top of the groundwater is found when not affected by recent pumping.

(www) (1) "Stockwatering" means the watering of livestock and other uses of water directly related to either of the following:

(A) The operation of a feedlot with the capacity to confine 1,000 or more head of cattle; or

(B) any other confined livestock operation or dairy that would divert 15 or more acre-feet of water per calendar year.

(2) Stockwatering shall not include the irrigation of feed grains or other crops.

(3) For the purposes of this subsection, a group of feedlots or other confined feeding operations shall be considered to be one feedlot or confined feeding operation if both of these conditions are met:

(A) There are common feeding or other physical facilities.

(B) The group of facilities is under common management.

(xxx) "Straight pipe" means a straight length of pipe free of all internal obstructions, including size changes, valves, cooling coils, injection ports, sand or foreign material, and any other condition that would cause a disturbance of the internal velocity profile in the pipe. Internal obstructions shall not include properly designed, constructed, and installed straightening vanes and inspection ports.

(yyy) "Stream channel aquifer" means unconsolidated water-bearing deposits in river valleys, flood plains, and terraces that are separate and distinct from any other aquifer and capable of yielding water in sufficient quantities for beneficial use.

(zzz) "Surface water" means water in creeks, rivers, or other watercourses, and in reservoirs, lakes, and ponds.

(aaaa) "Term permit" means a permit to appropriate water issued for a specified period of time. At the end of the specified time, or any authorized extension of it, the permit shall be automatically dismissed, and any priority it may have had shall be forfeited.

(bbbb) "The production and return of saltwater in connection with the operation of oil and gas wells in accordance with the written approval granted therefor by the Kansas corporation commission pursuant to K.S.A. 55-901, and amendments thereto" means only that saltwater actually produced during the primary production of oil and gas wells and shall not include the following:

(1) Saltwater used in the drilling of an oil and gas well; and

(2) saltwater injected into an enhanced recovery injection well, unless that saltwater was produced in the primary production of the oil and gas well, separated from the oil and gas, and then subsequently reinjected.

(cccc) "Thermal exchange" means the use of water for climate control in a nondomestic building and in a manner that is essentially nonconsumptive to the source of supply.

(dddd) "Totalizer" means the mechanical or electronic portion of the register that displays the total quantity of water that has passed the water flowmeter sensor.

(eeee) "Unconfined Dakota aquifer system" means that portion of the Dakota aquifer system not overlain by Graneros shale.

(ffff) "Unconsolidated regional aquifer" means a body of mostly unconsolidated and heterogeneous water-bearing deposits that are hydraulically and geologically contiguous, and are capable of yielding water in sufficient quantities for beneficial use.

(gggg) "Waste of water" means any act or omission that causes any of the following:

(1) The diversion or withdrawal of water from a source of supply that is not used or reapplied to a beneficial use on or in connection with the place of use authorized by a vested right, an appropriation right, or an approval of application for a permit to appropriate water for beneficial use;

(2) the unreasonable deterioration of the quality of water in any source of supply, thereby causing impairment of a person's right to the use of water;

(3) the escaping and draining of water intended for irrigation use from the authorized place of use; or

(4) the application of water to an authorized beneficial use in excess of the needs for this use.

(hhhh) "Waterpower use" means the use of falling water for hydroelectric or hydromechanical power.

(iiii) "Water balance" means the method of determining the amount of water in storage in a basin storage area by accounting for inflow to, outflow from, and changes in storage in that basin storage area.

(jjjj) "Water flowmeter" means the combination of a flow-sensing device, measuring chamber, integral or remote display device or register, and any connecting parts required to make a working assemblage to measure, record, and allow determination of flow rate and total quantity of water flowing past the water flowmeter sensor.

(kkkk) "Water storage device" means a reservoir, elevated water tank, pressurized water tank, including a bladder tank, or other container into which water is pumped and stored before beneficial use.

(llll) "Water use correspondent" means a person designated in writing, on a form prescribed by the chief engineer, by one of the owners of a water right to file the water use reports required by K.S.A. 82a-732 and amendments thereto, on behalf of the owner or owners of that water right. (Authorized by and implementing K.S.A. 82a-706a; modified, L. 1978, ch. 460, May 1, 1978; amended May 1, 1980; amended May 1, 1981; amended May 1, 1983; amended May 1, 1986; amended Dec. 3, 1990; amended May 31, 1994; amended Sept. 22, 2000; amended Oct. 24, 2003.)

5-1-2. Standby well. In order for a well to qualify as a standby well:

(a) The well shall be maintained in operable condition and be capable of being hooked to a power source within a reasonable amount of time to allow the well to function effectively as a standby well.

(b) Both the primary well or wells and the standby well or wells shall be required to be metered by order of the chief engineer or as a condition of the water right or permit.

(c) The standby well shall be located close enough to the primary well so that both wells withdraw water from the same local source of supply.

(d) The standby well shall be authorized to divert the same rate and quantity as the primary well or wells. A limitation clause shall be placed on any water right or permit authorizing a standby well or wells limiting the standby well to no more than the rate and quantity authorized for the primary well or wells. With the limitation clause or clauses in effect, the standby well or wells shall not be counted in any safe yield, allowable appropriation, depletion or similar type of analysis. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706; effective May 31, 1994.)

5-1-3. Permitting requirements of the Kansas water appropriation act. An individual engaged in the drilling of water well test holes, seismic test holes, stratigraphic test holes, observation wells, and water quality sampling wells, shall not be required to have an approval of application pursuant to the Kansas water appropriation act if water will not be diverted for beneficial use. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-701(f), 82a-703, 82a-705, and K.S.A. 1999 Supp. 82a-711; effective Sept. 22, 2000.)

5-1-4. Water flowmeter specifications. Each water flowmeter required by the chief engineer, or required pursuant to a regulation adopted by the chief engineer, on or after the effective date of this regulation shall meet the following minimum requirements:

(a)(1) The water flowmeter has been certified by the manufacturer to register neither less than 98

percent nor more than 102 percent of the actual volume of water passing the water flowmeter when installed according to the manufacturer's instructions. This requirement shall be met throughout the water flowmeter's normal operating range without further adjustment or calibration.

(2) The manufacturer has certified to the chief engineer that it has an effective quality assurance program, including wet testing a random sample of production line water flowmeters with water flowmeter test equipment. The minimum number of samples to be tested shall be determined using a confidence interval of 90 percent, an expected compliance of 95 percent, and an acceptable error of two percent. The minimum number of samples of each model that shall be tested shall be calculated by multiplying 1,300 times the annual production of that model of water flowmeter divided by Q. Q equals four times the annual production of that water flowmeter plus 1,300.

(3) The manufacturer has certified that the water flowmeter test equipment described in paragraph (a)(2) has been tested annually and found accurate by standards traceable to the national institute of standards and technology (NIST). Documentation of the testing required in paragraphs (a)(1) and (2) shall be maintained by the manufacturer for a period of at least five years and shall be made available to the chief engineer upon request during normal business hours.

(b) The water flowmeter shall be designed and constructed so that it will meet the following criteria:

(1) Maintain the accuracy required by the chief engineer in K.A.R. 5-1-4(a) and K.A.R. 5-1-9(a);

(2) be protected by the following:

(A) A seal installed by the manufacturer or an authorized representative of the manufacturer; or

(B) a way that makes it impossible to alter the totalizer reading without breaking the seal or obtaining the authorization of the manufacturer, an authorized representative of the manufacturer, or the chief engineer;

(3) clearly indicate the direction of water flow;

(4) clearly indicate the serial number of the water flowmeter;

(5) have a weatherproof register that is sealed from all water sources;

(6) have a register that is readable at all times, whether the system is operating or not;

(7) be able to be sealed by an authorized representative of the chief engineer to prevent unauthorized manipulation of, tampering with, or removal of the water flowmeter;

(8) be equipped with a manufacturer-approved measuring chamber through which all water flows. Except for positive displacement water flowmeters, full-bore electromagnetic water flowmeters, and multijet water flowmeters, flow-straightening vanes shall be installed at the upstream throat of the water flowmeter chamber. The flow-straightening vanes shall meet either of the following criteria:

(A) Be designed and installed by the manufacturer, or an authorized representative of the manufacturer; or

(B) consist of at least three vanes that meet the following conditions:

(i) Are longer, when placed parallel to the length of the pipe, than the inside diameter of the pipe;

(ii) are equally spaced radially on the inner periphery of the pipe; and

(iii) are wider in diametrical distance than one-fourth of the inside diameter of the pipe;

(9) be equipped with an inspection port if the straightening vanes are not designed, constructed, and installed by the manufacturer or an authorized representative of the manufacturer. The port shall be of sufficient size and placement to allow determination of the following:

(A) The proper installation of the flow-straightening vanes; and

(B) the inside diameter of the pipe in which the water flowmeter sensor is installed;

(10) remain operable without need for recalibration to maintain accuracy throughout the operating life of the water flowmeter; and

(11) have a totalizer that meets the following criteria:

(A) Is continuously updated to read directly only in acre-feet, acre-inches, or gallons;

(B) has sufficient capacity, without cycling past zero more than once each year, to record the quantity of water diverted in any one calendar year;

(C) reads in units small enough to discriminate the annual water use to within the nearest 0.1 percent of the total annual permitted quantity of water;

(D) has a dial or counter that can be timed with a stopwatch over not more than a 10-minute period to accurately determine the rate of flow under normal operating conditions; and

(E) has a nonvolatile memory.

(c) Each water flowmeter that is required to be installed by the chief engineer, or that was required to be installed as a condition of either an approval of application or an order of the chief engineer, or pursuant to a regulation adopted by the chief engineer before the effective date of this regulation, shall meet the following minimum specifications:

(1) Each water flowmeter shall be of the proper size, pressure rating, and style, and shall have a normal operating range sufficient to accurately measure the water flow passing the water flowmeter under normal operating conditions.

(2) Each water flowmeter shall meet the accuracy requirements of K.A.R. 5-1-9(a). If the water flowmeter does not meet the accuracy requirements of K.A.R. 5-1-9(a), then the water flowmeter shall meet either of the following criteria:

(A) Be repaired so that it can meet the accuracy requirements of K.A.R. 5-1-9(a); or

(B) be replaced with a water flowmeter complying with all of the requirements of K.A.R. 5-1-4 and installed in a manner that meets the requirements of K.A.R. 5-1-6. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 82a-706c; effective Sept. 22, 2000; amended Oct. 24, 2003.)

5-1-5. Variances from water flowmeter specifications. (a) A variance from the chief engineer's water flowmeter specifications may be granted by the chief engineer if the water right owner furnishes detailed specifications of a proposed water flowmeter and demonstrates to the chief engineer all the following:

(1) A water flowmeter meeting the specifications of K.A.R. 5-1-4 will not satisfactorily serve the water user's needs.

(2) The proposed water flowmeter will meet the accuracy requirements of K.A.R. 5-1- 4(a) and (b).

(3) The proposed water flowmeter will provide a reliable and accurate water use record for that point of diversion.

(b) Variances shall be granted only on a site-by-site, case-by-case basis. No general variances shall be granted for any brand or model of water flowmeter, except as set forth in subsection (c).

(c) A limited variance shall be granted by the chief engineer for a period of up to three years to allow that specific brand and model of a water flowmeter to be tested in the field and to serve as a water flowmeter required by the chief engineer if all of the following conditions are met:

(1) The manufacturer demonstrates to the chief engineer that a particular model and brand of water flowmeter utilizes new technology, does not meet one or more of the requirements of K.A.R. 5-1-4, and is likely to be as reliable, or more reliable, than water flowmeters currently meeting all of the requirements of K.A.R. 5-1-4.

(2) The manufacturer agrees to install not more than 50, nor less than 10, water flowmeters to test the new technology.

(3) The manufacturer agrees to collect data for at least one year that is sufficient to allow the chief engineer to determine whether that brand and model of water flowmeter meets the reliability and accuracy specifications of K.A.R. 5-1-4. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706c; effective Sept. 22, 2000.)

5-1-6. Water flowmeter installation specifications. (a) Each water flowmeter required by the chief engineer to be installed or required pursuant to a regulation adopted by the chief engineer, on or after the effective date of these regulations shall meet the following minimum water flowmeter installation specifications:

(1) Each water flowmeter shall be installed in a manner that meets the following criteria:

(A) Meets or exceeds the instructions of the manufacturer; and

(B) except for a multijet and a positive displacement water flowmeter, is installed so that there are at least five pipe diameters of straight pipe upstream and at least two pipe diameters of straight pipe downstream of the sensor portion of the water flowmeter, regardless of the manufacturer's installation specifications.

(2) Each water flowmeter shall be sized and installed so that full pipe flow will be maintained through the water flowmeter and so that water velocity in the measuring chamber will be within the normal operating range of the water flowmeter at all times while water is being diverted.

(3) If a water flowmeter is located downstream of a water storage device, there shall be at least seven diameters of straight pipe upstream of the water storage device where a water flowmeter may be installed for a field test by the chief engineer.

(4) Each water flowmeter shall be installed at a location at which the flowmeter measures all water diverted from the source of supply and does

not measure water or other discharge, including tailwater and sewage effluent.

(b) Each water flowmeter that is required by the chief engineer to be installed, or that was required to be installed as a condition of either an approval of application or an order of the chief engineer, or pursuant to a regulation adopted by the chief engineer, before the effective date of these regulations, shall meet the following minimum installation specifications:

(1) Each water flowmeter shall be installed in a manner that meets or exceeds the instructions of the manufacturer and, except for a multijet and a positive displacement water flowmeter, shall be installed so that there are at least five pipe diameters of straight pipe upstream and at least two pipe diameters of straight pipe downstream of the sensor portion of the water flowmeter, regardless of the manufacturer's installation specifications.

(2) Each water flowmeter shall be sized and installed so that full pipe flow will be maintained through the water flowmeter and so that water velocity in the measuring chamber will be within the normal operating range of the water flowmeter at all times while the water is being diverted.

(3) Each water flowmeter shall be installed at a location at which the flowmeter measures all water diverted from the source of supply and does not measure water or other discharge, including tailwater and sewage effluent. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 82a-706c; effective Sept. 22, 2000; amended Oct. 24, 2003.)

5-1-7. Requirement to install a water flowmeter or other suitable water-measuring device. (a) All nondomestic, nontemporary wells and pump sites operated under the authority of an approval of application issued on or after the effective date of this regulation shall be equipped with a water flowmeter that meets or exceeds the specifications of the chief engineer effective at the time the application is approved by the chief engineer.

(b)(1) All nondomestic, nontemporary gravity diversions of water, including irrigation ditches, operating under the authority of an approval of application issued on or after the effective date of this regulation shall be equipped with a continuous recording gauge, or other suitable water-measuring device located at or near the headgate. Before installation, the water right owner shall submit plans and specifications for the proposed gauge, or other suitable water-measuring device, to the chief engineer and shall receive approval in writing from the chief engineer before installing the gauge or other suitable water-measuring device.

(2) The gauge or other suitable water-measuring device shall meet the following criteria:

(A) Register not less than 94% and not more than 106% of the actual volume of water passing the device under normal operating conditions when compared to a field test made by, or approved by, the chief engineer;

(B) be installed in accordance with the installation requirements of the chief engineer; and

(C) be maintained in a satisfactory operating condition any time water can reasonably be expected to be diverted.

(c) An approval of a nondomestic application for change in place of use, the point of diversion, or the use made of the water, or any combination of these, shall require the owner of the well or pump site to install a water flowmeter on all points of diversion authorized by the water right or approval of application, unless any of the following conditions is met:

(1) The applicant demonstrates to the chief engineer that the application to change the place of use meets the requirements of K.A.R. 5-5-11(e).

(2) The applicant demonstrates to the chief engineer both of the following:

(A) Installation of a water flowmeter meeting these specifications is not physically feasible.

(B) The applicant agrees to implement a reasonable, objective alternative of measuring the quantity of water diverted that is acceptable to the chief engineer.

(3) The water is being diverted from multiple points of diversion authorized by one water right that does not limit the maximum annual quantity and maximum rate of diversion by point of diversion, and all of the water flows to a common point where a water flowmeter meeting the requirements of K.A.R. 5-1-4 and K.A.R. 5-1-6 measures all of the water pumped from all of the points of diversion authorized by that water right.

(4) An application for change in point of diversion only is filed to change the point of diversion of only one well, when more than one well is authorized by the approval of application or water right that authorizes the well for which a change in point of diversion is sought. In this case, only the well that is being relocated shall be required to have a water flowmeter.

(d) Except as set forth in subsection (c), if an approval of an application for change requires the installation of a water flowmeter, the requirement to install a water flowmeter shall also be placed on all other water rights and approvals authorizing diversion of water from the same point of diversion.

(e) If any water right or approval of application has a condition requiring development, adoption, and implementation of a water conservation plan pursuant to K.S.A. 82a-733 and amendments thereto, a water flowmeter or suitable water-measuring device shall be installed on each authorized point of diversion in compliance with these regulations.

(f) The owner of a water right, including a domestic water right, or an approval of application shall also be required by the chief engineer to install a water flowmeter or other suitable water-measurement device that complies with these regulations on each authorized point of diversion if it is necessary for the chief engineer to effectively administer water rights to prevent impairment, to protect minimum desirable stream flows, to conserve water, or to otherwise carry out the duties of the chief engineer as set forth in the Kansas water appropriation act, K.S.A. 82a-701 et seq., and amendments thereto.

(g) Except as set forth in subsection (c), if a water flowmeter is required by the chief engineer, each point of diversion authorized by the approval of application or water right shall be required to have a separate meter. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706c; effective Sept. 22, 2000.)

5-1-8. Water flowmeter maintenance. If a water right owner is required by the chief engineer to install a water flowmeter, the water right owner shall maintain the water flowmeter in compliance, as defined by K.A.R. 5-1-1, whenever diversion of water can reasonably be expected to occur. If at any time the required water flowmeter fails to function properly, the owner shall promptly initiate action to repair or replace the meter, or to correct any problems with the installation. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706c; effective Sept. 22, 2000.)

5-1-9. Criteria to determine when a water flowmeter is out of compliance. A water flowmeter shall be considered to be out of compliance if any of the following criteria is met: (a) The water flowmeter registers less than 94 percent or more than 106 percent of the actual volume of flow water passing the water flowmeter. If necessary, this determination may be made by a field test conducted by, or approved by, the chief engineer.

(b) The seal placed on the totalizer by the manufacturer or the manufacturer's authorized representative has been broken, or the totalizer value has been reset or altered without the authorization of the manufacturer, an authorized representative of the manufacturer, or the chief engineer.

(c) A seal placed on the water flowmeter or totalizer by the chief engineer has been broken.

(d) The water flowmeter register is not clearly visible or is unreadable for any reason.

(e) There is not full pipe flow through the water flowmeter.

(f) Flow-straightening vanes have not been properly designed, manufactured, and installed.

(g) The water flowmeter is not calibrated for the nominal size of the pipe in which it is installed.

(h) The water flowmeter is not installed in accordance with the manufacturer's installation specifications. However, five diameters of straight pipe above the water flowmeter sensor and two diameters below the water flowmeter sensor shall be the minimum spacing, regardless of the manufacturer's installation specifications.

(i) A water flowmeter is installed at a location at which the flowmeter does not measure all of the water diverted from the source of supply. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 82a-706c; effective Sept. 22, 2000; amended Oct. 24, 2003.)

5-1-10. Duties of water right owner when a water flowmeter is out of compliance. (a) A water right owner, or the water right owner's authorized designee, shall promptly notify the chief engineer if any water flowmeter required by the chief engineer is out of compliance.

(b) Within 30 days after the date on which the out-of-compliance water flowmeter has been repaired or replaced, the water right owner or the water right owner's authorized designee shall notify the chief engineer in writing of the following information:

(1) The date the water flowmeter became out of compliance;

(2) the water flowmeter reading at the time the water flowmeter became out of compliance;

(3) if the water flowmeter was replaced, the following information:

(A) The brand, model, size, and serial number of the new water flowmeter;

(B) the units in which the new water flowmeter reads;

(C) the reading of the new water flowmeter at the time of installation; and

(D) the location of the new water flowmeter on the diversion works or delivery system;

(4) if the water flowmeter was repaired, the water flowmeter reading immediately before the repair and the reading of the water flowmeter at the time it was reinstalled or the repair was completed on site;

(5) the date the repair or replacement was completed; and

(6) the amount of water diverted while the water flowmeter was out of compliance.

(c) If the water right owner does not maintain a record of diversions of water that is sufficient to reasonably estimate the quantity of water diverted while the water flowmeter was out of compliance, it shall be assumed, for the sole purposes of enforcement of the terms, conditions, and limitations of the approval of application or water right, and priority administration of water rights among water users, that the diversion works were operated continuously at the tested rate of diversion during the entire period the water flowmeter was out of compliance. If the rate of diversion has not been tested by the chief engineer, then it shall be assumed that the diversion works were operated continuously at the authorized rate of diversion during the entire time the water flowmeter was out of compliance. The assumption set forth in this subsection shall not apply to the determination of the annual quantity of water diverted for the purpose of perfecting a water right.

(d) If the water right owner is required by the chief engineer to repair or replace an inoperable water flowmeter, it shall be the duty of the water right owner to ensure that the repaired or replaced water flowmeter is in compliance with K.A.R. 5-1-4 and K.A.R. 5-1-6. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706c; effective Sept. 22, 2000.)

5-1-11. Water flowmeter testing by a nonagency person. If a water right owner desires to have a water flowmeter flow rate test done by a nonagency person for any reason, a person may be approved by the chief engineer to perform a water flowmeter flow rate test if the person demonstrates to the chief engineer both of the following:

(a) The person has the training, skills, and experience necessary to properly conduct the test.

(b) The person has the appropriate water flowmeter to do the test, and the water flowmeter has been tested for accuracy with water flowmeter test equipment that has been found to be accurate using standards traceable to the national institute of standards and technology (NIST). The equipment shall have been tested and found to be accurate within 12 months of performing the water flowmeter test. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706c; effective Sept. 22, 2000.)

5-1-12. List of water flowmeters certified by the manufacturer to meet the specifications of the chief engineer. (a) A list of all makes and models of water flowmeters that have been certified by the water flowmeter manufacturer to meet the specifications of the chief engineer shall be maintained by the chief engineer. This list shall be made available by the chief engineer to the public upon request.

(b) A water flowmeter shall be placed on the list only if the manufacturer has submitted to the chief engineer all of the following information for each water flowmeter model:

(1) The water flowmeter manufacturer's name, address, contact person's name, and telephone number;

(2) the water flowmeter model name or number;

(3) proof that a random sample of water flowmeters of each model has been tested in accordance with the requirements of K.A.R. 5-1-4(a);

(4) the last date that the water flowmeter test equipment was tested and found to be accurate by standards traceable to the national institute of standards and technology (NIST);

(5) verification that the water flowmeter is designed and constructed so that accuracy will be maintained over the life of the water flowmeter;

(6) verification that the water flowmeter serial number and direction of flow are clearly indicated on the water flowmeter;

(7) verification that the register is weatherproof and sealed from all water sources;

(8) verification that the totalizer will read only in acre-feet, acre-inches, or gallons;

(9) the number of active digits in the totalizer;

(10) verification that the memory is nonvolatile;

(11) verification that the totalizer cannot be reset without breaking the manufacturer's seal or obtaining the authorization of the manufacturer, an authorized representative of the manufacturer, or the chief engineer;

(12) verification that the water flowmeter and register are constructed in such a manner that they can be sealed by the chief engineer;

(13) a description of the measuring chamber provided for each water flowmeter model;

(14) specifications of the flow-straightening vanes installed in the measuring chamber;

(15) the spacing recommendations for each water flowmeter model in terms of pipe diameters of straight pipe required upstream and downstream of the water flowmeter sensor; and

(16) the normal operating range of the water flowmeter.

(c) A brand or model of a water flowmeter shall be removed from the list of water flowmeters specified in subsection (a) of this regulation if it has been demonstrated to the chief engineer that the brand or model of water flowmeter does not reliably and consistently meet the accuracy standards of K.A.R. 5-1-9(a). (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 82a-706c; effective Sept. 22, 2000; amended Oct. 24, 2003.)

Article 2.—VESTED RIGHTS

5-2-1 and 5-2-2. Not in active use.

Editor's Note:

Proposed regulations 5-2-1 and 5-2-2 were rejected by the legislature, see L. 1978, ch. 460.

5-2-3. Battery of wells. Except as set forth in subsection (c), if a permit to appropriate water did not authorize a battery of wells, as defined in K.A.R. 5-1-1, before the effective date of this regulation, an application for change filed pursuant to K.S.A. 82a-708b, and amendments thereto, to add one or more wells to the authorized well to create a battery of wells shall not be approved unless all of the following criteria in either subsection (a) or (b) are met at the time that the application for change is filed:

(a) (1) The time to construct the diversion works has not expired.

(2) The proposed battery will meet the definition of a battery of wells as defined in K.A.R. 5-1-1.

(b) (1) The time to construct the diversion works has expired.

(2) A new application to appropriate water filed to appropriate water at the geocenter of the proposed battery of wells would meet the safe yield, allowable appropriation, or similar type of regulation, for a well filed at that location.

(3) The proposed battery of wells meets the definition of a battery of wells as defined in K.A.R. 5-1-1.

(c) Subsections (a) and (b) shall not apply to an application to change the point of diversion filed to add one or more wells to the authorized well to create a battery of wells if the proposed battery of wells is located within the boundary of a groundwater management district for which the chief engineer has adopted a specific regulation applicable to batteries of wells within that district. (Authorized by and implementing K.S.A. 82a-706a; effective Sept. 22, 2000.)

Article 3.—APPROPRIATION RIGHTS

5-3-1. Application acceptable for filing. (a) To be acceptable for filing, an application for an approval of application shall be accompanied by the statutorily required filing fee, except for an application for domestic use, and shall contain all of the following:

(1) The name and mailing address of each applicant;

(2) the signature of each applicant or each authorized representative;

(3) the proposed source of water supply;

(4) the proposed authorized place of use; and

(5) either a description of the location of the proposed point of diversion or a request for a 60-day period of time in which to establish the proposed point of diversion within a specifically described, nominal legal quarter section of land.

(b) When an application is received in the office of the chief engineer and assigned a number, the maximum quantity of water per calendar year and the maximum rate of diversion shall not be increased. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 82a-709; modified, L. 1978, ch. 460, May 1, 1978; amended May 1, 1980; amended Oct. 24, 2003.)

5-3-1a. Application for a basin term permit. An application for a basin term permit shall be filed on a form prescribed by the chief engineer. The term requested shall not exceed one year. A basin term permit may be extended in one-year increments if all of the following conditions are met:

(a) The request for extension is filed before the end of the current term in a manner acceptable to the chief engineer.

(b) The applicant has complied with the terms, conditions, and limitations of the basin term permit during the previous calendar year.

(c) Granting the requested extension will not cause impairment of each approval of application and water right with an earlier priority.

(d) The applicant shows good cause why the extension should be granted.

The total time authorized by a basin term permit shall not exceed five calendar years. Basin term permits shall not be transferable. At the end of the specified term, the permit shall be dismissed, and any priority it may have had shall be forfeited. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-712; effective Sept. 22, 2000.)

5-3-1b. Complete new application. (a) A new application to appropriate water for beneficial use shall be considered to be a "complete application" for the purposes of K.S.A. 82a-708a, and amendments thereto, if the application completely and accurately meets all the requirements specified in this regulation and the following criteria:

(1) The requirements specified in K.S.A. 82a-708a, and amendments thereto;

(2) the requirements specified in K.S.A. 82a-709, and amendments thereto;

(3) the requirements specified in K.S.A. 82a-710, and amendments thereto;

(4) any water conservation plans required by the chief engineer pursuant to K.S.A. 82a-733, and amendments thereto;

(5) the requirements of K.S.A. 82a-301 through K.S.A. 82a-305a, and amendments thereto, if the proposed point of diversion, or rediversion, is a dam or stream obstruction;

(6) the requirements specified in K.A.R. 5-3-1;

(7) the requirements specified in K.A.R. 5-3-4; and

(8) the requirements specified in K.A.R. 5-3-4d.

(b) If minimum desirable streamflow (MDS) requirements have been set for the proposed source of water supply, the application shall contain a statement signed by the applicant acknowledging that the MDS requirements apply to the proposed source of water supply and that the diversions of water authorized by this approval of application could be regulated at times to protect MDS.

(c) If the applicant is requesting a waiver or exemption of a regulation pursuant to K.S.A. 82a-1904, and amendments thereto, the applicant shall submit a written request for the waiver or exemption, and documentation to support the waiver or exemption.

(d) If the proposed point of diversion is located within the boundaries of a groundwater management district, a final recommendation or analysis of the availability of water has been received from the groundwater management district within the time limit set by the chief engineer concerning the approval, denial, or modification of the application.

(e) If a substantive question has been raised concerning whether approval of the application could cause impairment of senior water rights or prejudicially and unreasonably affect the public interest, the applicant shall submit sufficient information to resolve that question.

(f) If any actions are required to be taken by the applicant on other approvals of applications or water rights owned by the applicant in order to make the new application approvable, including dismissals, reductions in water rights in accordance with K.A.R. 5-7-5, and applications for change, all necessary forms shall be completed and filed with the chief engineer.

(g) The applicant shall submit all information and data necessary to demonstrate that the application complies with the applicable regulations adopted by the chief engineer. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a, K.S.A. 2002 Supp. 82a-708a, K.S.A. 82a-709, K.S.A. 82a-710, K.S.A. 2002 Supp. 82a-711, K.S.A. 82a-733, and K.S.A. 2002 Supp. 82a-1904; effective Oct. 24, 2003.)

5-3-2. Priorities. (a) Upon receipt in the office of the chief engineer of an acceptable application for permit to appropriate water for beneficial use, accompanied by the statutory application fee, a stamp showing the date and time of receipt shall be placed on the application form. The date and time of receipt of the application for any use, other than domestic, shall establish the priority of whatever appropriation right that may be subsequently perfected pursuant to the application; (b) The date and time of the receipt of an application for permit to appropriate water for domestic use or the date of the first use of water for such purpose, whichever is earlier, shall establish

the priority of the appropriation right for domestic use. When the first use of water is earlier in time than the filing date of an application, the applicant shall furnish affidavits from disinterested parties to substantiate the date that water was first used from the appropriate water supply for domestic purposes. (Authorized by K.S.A. 82a-706a; modified, L. 1978, ch. 460, May 1, 1978.)

5-3-3. Storage of water for domestic use. Any person entitled to use water for beneficial purposes may collect and store the same so long as such collection, storage, use and times of use thereafter are consistent with reasonable storage and conservation practices. A reasonable quantity of water stored for domestic use shall be considered to be that quantity sufficient to satisfy the domestic use for the current year and two succeeding years. (Authorized by K.S.A. 82a-706a; modified, L. 1978, ch. 460, May 1, 1978.)

5-3-3a. Legal access. If the chief engineer is aware, or becomes aware, that the applicant does not have legal access to either the point of diversion or the place of use, before an application for any of the following can be approved by the chief engineer, the applicant shall demonstrate that the applicant has legal access to the proposed point of diversion and the proposed place of use before the approval of the application: (a) An approval of application;

(b) a change in place of use;

(c) a change in point of diversion; or

(d) any combination of subsections (a), (b), and (c). (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-708a; effective Oct. 24, 2003.)

5-3-4. Application contents. (a) Each application for permit to appropriate water for beneficial use shall contain all the information requested for the proposed uses as set forth in the prescribed application form and such other information as may be required for a proper understanding of the proposed appropriation.

(b) Each application shall be accompanied by an aerial photograph or a detailed plat preferably to a scale of one (1) inch equals one thousand three hundred and twenty (1,320) feet, or a U.S. geological survey topographic map, scale 1:24,000. Information that shall be plotted on the plat, photograph, or topographic map is as follows:

(1) The section corners.

(2) The center of the section, identified by the section number, township and range.

(3) The location of the point of diversion—well location, stream bank pump site, dam location or location of other works for diversion of water—indicated by an appropriate symbol.

(4) The location of the place of use identified by crosshatching or by some other appropriate method.

(5) The location of all other water wells of every kind within one-half (½) mile of the well(s) covered by the proposed appropriation, each of which shall be identified as to its use and the name and mailing address of the owner, if the proposed appropriation is for use of groundwater.

(6) The name and mailing address of the owner(s) of each tract of land adjacent to the stream for a distance of one-half (½) mile upstream and one-half (½) mile downstream from the property lines of the land owned or controlled by the applicant, if the proposed appropriation is for the use of surface water.

(7) The locations of proposed or existing dams, dikes, reservoirs, canals, pipelines, power houses and other structures for the purpose of storing, conveying or using water.

(8) A north arrow and scale.

The information shown on the photograph or plat shall be legible. Black line prints may be submitted in lieu of the original drawing if a plat is submitted.

(c) Separate applications shall be filed for surface water and groundwater.

(d) If the source of supply is groundwater, a separate application shall be filed for each proposed well or battery of wells, except that up to four (4) wells within a circle with a quarter (¼) mile radius in the same local source of supply which do not exceed a maximum diversion rate of twenty (20) gallons per minute per well and which are operated by means of submersible pumps may be included in a single application. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-709; modified, L. 1978, ch. 460, May 1, 1978; amended May 1, 1980; amended May 1, 1981.)

5-3-4a. Hearing prior to approval of application. A hearing may be held before the chief engineer, or a person designated by the chief engineer, on an application to appropriate water for beneficial use prior to approval, when the chief engineer finds it to be in the public interest to hold a hearing, or a hearing has been requested

by a person who shows to the satisfaction of the chief engineer that approval of the application may cause impairment of senior water rights or permits. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1993 Supp. 82a-711; effective May 1, 1980; amended May 31, 1994.)

5-3-4b. Deadlines for return of documents. (a) If the chief engineer allows a person a specific number of days to return or submit a document or other information, the time period shall be computed as prescribed in K.S.A. 60-206(a) and (e), and amendments thereto.

(b) If a person is given until a specific date to return or submit a document or other information, the document or information shall be deemed to be timely filed if it is received in the office of the chief engineer no later than the third working day following the specified date. Working days shall be all days except Saturdays, Sundays, and legal holidays designated by the United States congress, the Kansas legislature, or the governor of Kansas. Half holidays shall be counted as working days.

(c) Any document that is postmarked by the United States postal service with a legible date on or before the deadline set by the division for returning the document shall be accepted by the division as being timely filed, regardless of when it is received. In the case of United States registered mail, the date of registration shall be deemed to be the postmark date. The term "United States postal service," as used in this subsection, shall include a private delivery service available to the general public that routinely records, in the regular course of business, the date the item is given to the service for delivery. The date the item is given to the service for delivery shall be deemed to be the postmark date. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-710; effective May 1, 1980; amended Sept. 22, 2000.)

5-3-4c. Retaining new applications. (a) A new application to appropriate water for beneficial use shall be held by the chief engineer in accordance with the terms of subsection (b) if the application meets both of the following conditions:

(1) The application is in proper form and has been completely processed, but cannot be approved because it does not currently comply with one or more statutory or regulatory requirements, including spacing, safe yield, and allowable appropriation regulations.

(2) There is good cause to believe that, if the application were held for a reasonable period of time, it may be approvable in the future because of actions currently pending on other permits and water rights in the area, including issuance of certificates, dismissals of applications, and declarations of abandonment.

(b) Upon demonstration by the applicant to the chief engineer that the application apparently could be approved within a reasonable time, not to exceed 365 days from the date the request to retain the application was received by the chief engineer, if the pending actions take place, the applicant's pending new application may be held by the chief engineer for a period not to exceed 365 days.

(c) If the application still cannot be approved at the end of the time set forth in section (b), the application shall be dismissed by the chief engineer and the priority of the application forfeited.

(d) If any prior applications to appropriate water or prior applications to change the point of diversion from the same source of supply are not complete and if the approval or denial of these applications could affect the approval of the proposed new application or application to change a water right, then the 150-day period specified in K.S.A. 82a-708a, and amendments thereto, shall begin to run only after all these prior applications have been processed. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-705, K.S.A 82a-706a, K.S.A. 2002 Supp. 82a-708a, and K.S.A. 82a-710; effective Sept. 22, 2000; amended Oct. 24, 2003.)

5-3-4d. Stratigraphic log requirements. (a) Except as set forth in subsection (b), each applicant who files either of the following applications shall submit to the chief engineer a stratigraphic log for a test hole located within 300 feet of the proposed new or replacement well:

(1) A new application to appropriate groundwater, except for domestic use, a temporary permit, or a term permit for fewer than five years; or

(2) an application to change the point of diversion to relocate a well.

This stratigraphic log shall contain geologic and any other information sufficient to allow the chief engineer to understand the lithology and to classify the groundwater source formation or formations from which the proposed well will be withdrawing water.

(b) (1) If an application is filed for a new well, the stratigraphic log shall not be required if the

chief engineer has sufficient information to understand the lithology and determine the groundwater source formation or formations from which the proposed well will be withdrawing water.

(2) If an application is filed for a change in point of diversion, the stratigraphic log shall not be required if the chief engineer has sufficient information to understand the lithology and determine the groundwater source formation or formations from which the original well withdrew water and the replacement well will withdraw water.

(c) Each applicant to construct a new well or to change the point of diversion to a newly constructed well who submitted a stratigraphic log to the chief engineer pursuant to subsection (a) above shall not be required to submit to the chief engineer a copy of the stratigraphic log of the completed well as required by the Kansas department of health and environment under the authority of K.S.A. 82a-1212 and amendments thereto. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a, K.S.A. 82a-709, and K.S.A. 82a-710; effective Sept. 22, 2000; amended Oct. 24, 2003.)

5-3-4e. Groundwater source formation codes. The Kansas department of agriculture, division of water resources' document titled "groundwater source formation codes," dated June 24, 2004, is hereby adopted by reference. The groundwater source formation codes used by the chief engineer in administering the Kansas water appropriation act shall be the codes specified in this document. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-709; effective Sept. 22, 2000; amended, T-5-8-23-04, Aug. 23, 2004; amended Nov. 29, 2004.)

5-3-5. Approval of application. The approval of an application on the prescribed form shall constitute a permit to proceed with the construction of authorized diversion works and the diversion and use of water.

The applicant shall be notified of the approval of the application by transmitting to him or her the original document setting forth the terms, conditions, and limitations of the permit which has been duly dated and signed by the chief engineer or his or her authorized representative. A copy of the approval of application and permit to proceed shall be maintained in the office of the chief engineer or the appropriate field office. (Authorized by K.S.A. 82a-706a; modified, L. 1978, ch. 460, May 1, 1978.)

5-3-5a. Authorization for the use of water for emergency purposes. The chief engineer, or a person designated by the chief engineer, may authorize the use of water for emergency purposes. The emergency approval shall be subject to the terms, conditions and limitations specified by the chief engineer and may be granted when determined to be in the public interest or when needed to protect the quality of a water supply, to provide fire protection, or to provide an alternate point of diversion or source of supply when the principal source of supply or point of diversion is unavailable due to conditions beyond the control of the applicant. (Authorized by K.S.A. 82a-706a, 82a-711; effective May 1, 1980.)

5-3-5b. Approval of application for water for the development of underground storage in mineralized formations. In any case where it is not technologically and economically feasible to utilize poorer quality water for the development of underground storage in mineralized formations and fresh water must be used, the chief engineer shall require the construction of surface brine storage facilities to the extent economically and technologically feasible in an amount not to exceed forty percent (40%) of underground storage capacity of the applicant. This regulation does not exempt a person from complying with the requirements of other state and federal agencies relative to the construction of surface brine storage facilities. (Authorized by K.S.A. 82a-706a, 82a-707(d); effective May 1, 1980.)

5-3-5c. Check valves. (a) All diversion works not subject to regulation under the Kansas chemigation safety law, K.S.A. 2-3301 et seq. and amendments thereto, into which any type of chemical or other foreign substances will be injected into the water pumped from the diversion works shall be equipped with an in-line, automatic, quick-closing check valve capable of preventing pollution of the source of the water supply.

(b) Each check valve required by the chief engineer shall be constructed and installed in accordance with the requirements specified in K.A.R. 5-6-13a.

(c) Each check valve and all required components shall be maintained in an operating condition that prevents backflow into the source of water supply whenever a foreign substance could reasonably be expected to be introduced into the water system. (Authorized by K.S.A. 82a-706a;

implementing K.S.A. 82a-706, K.S.A. 82a-706a, K.S.A. 82a-712; effective May 1, 1980; amended May 1, 1981; amended Oct. 24, 2003.)

5-3-5d. Persons required to install a water level measurement tube. Every well with an authorized maximum rate of diversion of 100 or more gallons per minute drilled after the effective date of this regulation, except those wells authorized under a temporary permit, a domestic right, or a term permit for five or fewer years, shall have a tube installed in accordance with specifications adopted by the chief engineer. This tube shall be suitable for making water level measurements and shall be maintained in a satisfactory condition. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706c; effective May 1, 1980; amended Sept. 22, 2000.)

5-3-5e. Meters and other water-measuring devices; reporting readings; maintenance, and replacement. (a) For the purpose of this regulation, "meter" shall mean a water flowmeter or other water-measuring device.

(b) Whenever the installation of a meter is required by the chief engineer as a condition of a water right or permit, by written order of the chief engineer, or by requirement of a groundwater management district, the water right owner shall report all information required on the form prescribed by the chief engineer pursuant to K.S.A. 82a-732, and amendments thereto, including the following:

(1) The beginning and ending readings of the meter each calendar year;

(2) the units in which the meter registers; and

(3) the quantity of water diverted during the calendar year in the same units in which the meter registers.

(c) Whenever a totalizing hour meter has been required by the chief engineer or a groundwater management district, the water right owner shall report all information required on the form prescribed by the chief engineer pursuant to K.S.A. 82a-732, and amendments thereto, including the following:

(1) The beginning and ending readings of the meter each calendar year;

(2) the units in which the meter registers; and

(3) the rate of diversion at which water is pumped in gallons per minute. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-732; effective May 31, 1994; amended Sept. 22, 2000.)

5-3-5g. Designation of a water use correspondent. If the owner or owners of an approval of application or a water right desire to delegate the authority to receive and submit the annual water use reports as prescribed by K.S.A. 82a-732, and amendments thereto, to another person, an owner of the approval of application or the water right shall sign and submit a form prescribed by the chief engineer designating the person responsible to receive and submit the required annual water use report. However, the water right owner or owners shall remain, in all cases, the person or persons legally responsible for filing the water use reports required by K.S.A. 82a-732, and amendments thereto. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-732; effective Sept. 22, 2000.)

5-3-5h. Water conservation plans. Each water conservation plan shall be submitted on a form prescribed by the chief engineer. The plan shall also contain the name, address, and telephone number of the designer of the water conservation plan. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-733; effective Sept. 22, 2000.)

5-3-5i. Time limit to implement a water conservation plan. (a) The time to fully implement the water conservation plan shall be limited by the chief engineer to a reasonable specific date, which may be extended for good cause shown by the applicant.

(b) A municipal or industrial water user shall be given at least one full calendar year after the conservation plan is approved by the chief engineer to fully implement the water conservation plan.

(c) A user of water for irrigation shall be given at least one full growing season after the conservation plan is approved by the chief engineer to fully implement the approved water conservation plan. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-733; effective Sept. 22, 2000.)

5-3-5j. Maintenance of a water conservation plan. Once implemented, the applicant shall continue to satisfactorily maintain each component of the water conservation plan. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-733; effective Sept. 22, 2000.)

5-3-5k. Review of a water conservation plan. The right to review the water conservation plan to determine if it is consistent with current guidelines adopted and maintained pursuant to

K.S.A. 74-2608, and amendments thereto, shall be reserved by the chief engineer. If the review determines that the water conservation plan is materially different from those guidelines, then the owner of the water right or approval of application may be ordered by the chief engineer to amend the water conservation plan to make it consistent with the current guidelines for conservation plans and practices adopted and maintained pursuant to K.S.A. 74-2608, and amendments thereto. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-733; effective Sept. 22, 2000.)

5-3-5*l*. Changes in a water conservation plan. If a person required to implement a water conservation plan desires to make a material change in the plan, that person shall submit a request to make the change to the chief engineer on a form prescribed by the chief engineer. Any material change in an approved water conservation plan shall require the prior written approval of the chief engineer. Any proposed change in a water conservation plan shall be subject to the same type of review as that required for the original water conservation plan. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-733; effective Sept. 22, 2000.)

5-3-5m. Limited power of attorney. If all of the owners of an approval of application or water right desire to authorize any other person to take any type, or types, of official action on behalf of the approval of application or water right, all of the owners of the approval of application or water right shall meet the following requirements:

(a) A limited power of attorney shall be submitted to the chief engineer.

(b) The limited power of attorney shall be signed and acknowledged by all of the owners of the approval of application or water right and filed pursuant to the provisions of K.S.A. 58-601, and amendments thereto. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 82a-701 et seq.; effective Sept. 22, 2000.)

5-3-5n. Authorized place of use. (a) Except as set forth in subsection (b), each approval of application, or an approval of an application for change filed in accordance with K.S.A. 82a-708b, and amendments thereto, shall describe the authorized place of use as either of the following:

(1) Land not authorized for beneficial use of water by any other water right or approval of application; or

(2) exactly the same land authorized for beneficial use of water by one or more prior approvals of applications or water rights.

(b) The requirement in subsection (a) shall not apply to applications that propose to partially overlap the authorized place of use with any of the following:

(1) A municipality;

(2) an irrigation district;

(3) an irrigation ditch company;

(4) a rural water district;

(5) another authorized place of use that cannot all be physically served by all of the water rights and approvals of applications;

(6) an authorized place of use that is owned by different landowners who do not operate together; or

(7) the owner or owners of the water rights and approvals of applications demonstrate both of the following to the chief engineer:

(A) It is not practical or desirable to have a complete overlap.

(B) Allowing an incomplete overlap of authorized places of use will not prejudicially and unreasonably affect the public interest. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-709; effective Sept. 22, 2000.)

5-3-5o. Amending water use reports. (a) Except as specified in this subsection, each annual water use report submitted to the chief engineer pursuant to K.S.A. 82a-732, and amendments thereto, shall be considered the official report of water use information filed in the office of the chief engineer. Each person who files a request to correct a water use report shall ensure that the water use report is corrected in accordance with all of the following procedures, in order for the corrected report to be considered the official report:

(1) A written request to correct the report is submitted to the chief engineer on a form prescribed by the chief engineer.

(2) Each requested change in the water use report is documented by independent, verifiable supporting information, including fuel records, power records, crop production records, county appraiser records, natural resource conservation service records, crop insurance records, other similar types of records, and any combination of these records. The independent, verifiable supporting information may be supported by an affidavit from one or more competent, disinterested

persons who have actual personal knowledge of the facts.

(3) The written request, including the supporting documentation, is verified upon oath or affirmation to be accurate and complete to the best knowledge of the person filing the request.

(4) The person filing the request to change a water use report sustains the burden to show the following:

(A) How the water use report on file in the office of the chief engineer is erroneous or incomplete; and

(B) that the proposed changes are the most complete and accurate water use information available.

(b) The right to perform the following shall be reserved by the chief engineer:

(1) Contest the accuracy and completeness of any water use report filed with the chief engineer, or corrected in accordance with this regulation, to show that the water use report is inaccurate, incomplete, false, or fraudulent; and

(2) make a determination of the actual water use based on the best available information. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 82a-732; effective Aug. 13, 2004.)

5-3-6. Forfeiture, revocation and dismissal. Failure of the applicant or his or her successors to comply with the provisions of the approval of application and permit to proceed and its terms, conditions and limitations without good cause shall result in the forfeiture of the priority date, revocation of the permit and dismissal of the application. (Authorized by K.S.A. 82a-706a; modified, L. 1978, ch. 460, May 1, 1978.)

5-3-6a. Sealing pumps. If the chief engineer, or any of his or her duly authorized representatives, has reasonable cause to believe that any person has failed to obey an order of the chief engineer to cease and desist from operating a pump or other diversion device, the chief engineer or his or her duly authorized representative shall place a seal, or chain and padlock, on the pump or device in such a manner as to render the pump or other diversion device inoperable.

If the seal, or chain and padlock, is broken without the written permission of the chief engineer, this shall create a rebuttable presumption that the pump had been unlawfully operated in violation of the order of the chief engineer and that the water right holder has been acting in violation of the conditions of his or her permit to appropriate water for beneficial use.

The suspected violator shall be informed in writing of the creation of this presumption at the time the seal, or chain and padlock, is installed on the pump or other diversion device. (Authorized by K.S.A. 82a-706a, 82a-706b; effective May 1, 1980.)

5-3-7. Request for extension of time. (a) For applications filed after May 1, 1978, any request for extension of time either for completion of diversion works or for perfecting the appropriation shall be submitted to the chief engineer before the expiration of the time allowed for completing the diversion works or perfecting the appropriation. The request shall be signed by the holder of the approval of application and permit to proceed, by the owner of the land to be irrigated, by an authorized official of a municipality, corporation or partnership, or by any other person that has a recognized interest in the appropriation. Failure to request an extension of time to perfect the appropriation within the time allowed shall limit the water appropriation right to the extent perfected in accordance with the terms, conditions, and limitations set forth in the approval of application.

(b) The request for an extension of time either for completion of diversion works or for perfecting the appropriation shall be accompanied by the statutorily required filing fee and shall include the following information:

(1) The application number;

(2) the date by which the diversion works will be completed or the appropriation will be perfected;

(3) the progress that has been made toward completing the diversion works or perfecting the appropriation;

(4) if for irrigation, the number of acres of land to which water has been applied during one calendar year;

(5) the reason why the diversion works have not been completed or the appropriation has not been perfected; and

(6) the plans for completing the diversion works or perfecting the appropriation. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-714(e); modified, L. 1978, ch. 460, May 1, 1978; amended Oct. 24, 2003.)

5-3-8. Certificate of appropriation. Upon

determination that the appropriation diversion works have been completed and an appropriation right perfected in conformity with an approved application and plans, the chief engineer shall issue a certificate of appropriation setting forth the extent to which the appropriation right was perfected. No appropriation shall be determined for a quantity of water or a diversion rate in excess of that set forth in the approval of application and permit to proceed or in excess of that found to have been actually applied to the approved beneficial use or for any quantity of water found to have been wasted during the calendar year of record used as the basis for perfecting the appropriation right. (Authorized by K.S.A. 82a-706a; modified, L. 1978, ch. 460, May 1, 1978.)

5-3-9. Public interest. (a) In accordance with K.S.A. 82a-711(b)(5), as amended, in ascertaining whether a proposed use will prejudicially and unreasonably affect the public interest, the chief engineer shall also take into consideration the quantity, rate and availability of water necessary to:

(1) satisfy senior domestic water rights from the stream;

(2) protect senior water rights from being impaired by the unreasonable concentration of naturally occurring contaminants; and

(3) over the long term reasonably recharge the alluvium or other aquifers hydraulically connected to the stream.

(b) Unless otherwise provided by regulation, it shall be considered to be in the public interest that only the safe yield of any source of water supply, including hydraulically connected sources of water supply, shall be appropriated. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1993 Supp. 82a-711; effective Nov. 28, 1994.)

5-3-10. Availability of water for appropriation - safe yield. (a) Except as set forth in subsection (b) and K.A.R. 5-3-16 and K.A.R. 5-3-17, the approval of any new application to appropriate groundwater or surface water for beneficial use, except for domestic use, temporary use and term permits for five years or less, shall not cause the safe yield of the source of water supply to be exceeded, neither shall it otherwise prejudicially and unreasonably affect the public interest. The approval of term permits shall not allow impairment nor prejudicially and unreasonably affect the public interest.

(b) This regulation shall not apply to an application which proposes:

(1) to divert water from a source of water supply subject to a different safe yield, allowable appropriation, depletion or other similar type of criteria adopted by rule and regulation of the chief engineer or intensive groundwater use control area order of the chief engineer issued pursuant to K.S.A. 82a-1036 et seq., or

(2) to use water in a manner so that there is no significant net consumptive use of the local source of supply either in quantity or availability of water for use by other appropriators.

(c) If a total quantity of water that is available for appropriation in any basin, subbasin, stream reach or other hydrologic unit has been determined by the chief engineer prior to the date that application is filed, the total quantity of water authorized by vested rights, prior appropriations, requests by prior unapproved applications and the proposed appropriation shall be determined by the chief engineer.

(1) If the total quantity of water authorized and requested by applications with earlier filing dates is less than or equal to the total annual quantity of water determined to be available for appropriation, or if no total quantity of water available was determined by the chief engineer prior to the date the application was filed, the following procedures shall be used by the chief engineer to further evaluate the applications:

(A) K.A.R. 5-3-11 shall be used to evaluate an application to appropriate groundwater from an unconfined aquifer;

(B) K.A.R. 5-3-14 shall be used to evaluate an application to appropriate groundwater from a confined aquifer; or

(C) K.A.R. 5-3-15 shall be used to evaluate an application to appropriate surface water.

(2) If the total quantity of water authorized and requested exceeds the limit determined by the chief engineer pursuant to this subsection, the application shall be denied or considered only for the quantity available. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1993 Supp. 82a-711; effective Nov. 28, 1994.)

5-3-11. Availability of water for appropriation-safe yield; unconfined groundwater aquifers. (a) Each application to appropriate groundwater from an unconfined aquifer shall be processed in accordance with this regulation.

(b) To determine the safe yield available for ap-

propriation from an unconfined aquifer at a specific location, the following procedure shall be used by the chief engineer:

(1) The amount of calculated recharge occurring within the area of consideration shall be determined by the chief engineer.

(2) That amount shall be multiplied by the percent of calculated recharge determined by the chief engineer to be available nondomestic groundwater and surface water for appropriation.

(3) The total quantity of water authorized and requested in the same area of consideration shall be subtracted from the number derived from paragraph (b)(2) above. If a water right or permit authorizes more than one point of diversion and not all of them are within the area of consideration, the authorized quantity shall be divided equally between or among all the points of diversion, unless information is available to more accurately distribute the authorized quantity between or among the multiple points of diversion.

(c) (1) If the quantity of water remaining is sufficient to satisfy the proposed application, then the safe yield criteria shall be deemed to have been met, unless there are other relevant factors that need to be taken into account in order to protect the public interest. The application shall then be processed according to other criteria in effect in that area.

(2) If there is sufficient water available to reasonably satisfy part of the request, then the application shall be approved for the quantity available if the remaining quantity is reasonable for the proposed use and the application meets the other applicable criteria in that area.

(3) If no water is available to satisfy the proposed application, then the application shall be denied by the chief engineer.

(d)(1) In making a safe yield calculation, unless the context clearly requires otherwise, the following words and phrases shall have the meanings ascribed to them:

(A) "Circle" means a circle with a two-mile radius, with the proposed point of diversion as the center.

(B) "Area of consideration" means the portion of the two-mile circle located within the limits of the unconfined aquifer expressed in acres, including any area of the circle located within the boundaries of a groundwater management district. The area of consideration shall not include any portion of the circle located outside the state of Kansas.

(C) "Total quantity of water" means the total combined authorized annual quantities under all groundwater rights and approvals of applications, and requested by pending applications with a senior priority in that unconfined aquifer except for domestic use, temporary permits, and term permits for five or fewer years with priority dates senior to the proposed application and with points of diversion located within the area of consideration.

(D) "Calculated recharge" means that portion of the average annual precipitation that becomes recharge to the unconfined aquifer, calculated using the data shown on water resources investigations report 87-4230, plate no. 4, dated 1987, prepared by the United States geological survey, hereby adopted by reference, interpolated to the nearest tenth of an inch, unless better or more specific recharge data for the area of consideration, basin, or aquifer is supplied by the applicant or is already available to the chief engineer.

(2) The calculated recharge in the Kansas river alluvium shall be determined by taking 25% of the average annual rainfall in the area of consideration as taken from figure 2, United States geological survey water resources investigation report 92-4137, dated 1993, hereby adopted by reference, interpolated to the nearest 0.1 of an inch.

(3) For each application to appropriate groundwater from an unconfined aquifer filed on or after the effective date of this regulation, the percentages of calculated recharge that shall be considered to be available for appropriation shall be determined using the following table:

Percent of Calculated Recharge Available for Appropriation	River Basin
(A) 100% plus the recharge from the Missouri River available to the well, as calculated by a Jenkins or similar stream-depletion technique.	Missouri
(B) 100%	Arkansas River below Hutchinson*
	Big Blue River **
	Black Vermillion River **
	Delaware River **
	Little Arkansas River below GMD No. 2 *
	Little Blue River **
	Little Osage River **
	Lower Republican River Basin outside the effective alluvium and the Belleville formation that does not contribute significant baseflow to a stream**

Percent of Calculated Recharge Available for Appropriation	River Basin
	Marais des Cygnes River **
	Mill Creek **
	Marmaton River **
	Nemaha River **
	Pottawatomie Creek **
	Smoky Hill River below its confluence with the Saline River **
	Spring River *
	Stranger Creek **
	Sugar Creek **
	Vermillion Creek **
	Wakarusa River **
	Walnut River *
	Any hydrologic unit that does not contribute significant baseflow to a stream.
(C) 75%	Any hydrologic units in the following river basins that contribute significant baseflow to a stream:
	Arkansas River above Hutchinson*
	Caney River *
	Cottonwood River *
	Cow Creek outside the boundaries of GMD No. 2 and GMD No. 5*
	Elk River *
	Fall River *
	Kansas River **
	Little Arkansas River above GMD No. 2 *
	Lower Republican River Basin outside the effective alluvium and the Belleville formation that contributes significant baseflow to a stream. **
	Neosho River *
	Ninnescah River *
	Saline River **
	Salt Creek **
	Smoky Hill above its confluence with the Saline River **
	Solomon River **
	South Fork Ninnescah River (except Smoots Creek) *
	Upper Republican Basin outside areas closed to new appropriations as set forth in paragraph (d)(5) of this regulation. **
	Verdigris River *
	Any other basin in Kansas not specifically identified
(D) 50%	Any hydrologic units in the following river basins that contribute significant baseflow to a stream:
	Bluff Creek-Chikaskia River *
	Bluff Creek-Cimarron River *
	Chikaskia River *
	Cimarron River outside GMD No. 3 *
	Medicine Lodge River *
	North Fork Ninnescah River *
	Rattlesnake Creek *
	Salt Fork Arkansas River *
	Sandy Creek *
	South Fork Ninnescah River (Smoots Creek only) *

* Located in Arkansas River Basin
** Located in Kansas River Basin

(4) The total quantity of water and the percent of calculated recharge originally available to be appropriated for nondomestic groundwater and surface water use in all or part of the following basins, subbasins, stream reaches, and other hydrologic units identified in electronic data file unitbsn.e00, dated July 30, 1997, prepared by the division of water resources, Kansas department of agriculture and hereby adopted by reference for the purpose of defining the boundaries of the hydrologic units, shall be determined using the following table:

South-Central Kansas Designated Unit Areas

Map Label	Effective Date	Area (acres)	Recharge Rate (in/yr)	Recharge Quantity (Ac-ft/yr)	Percentage of Recharge to Appropriate	Original Quantities Available (Ac-ft/yr)	General Location (Twp.-Range)	Abbreviation for Portion of Basin or Basins

* Revision is effective the date of this regulation.

(5) The following hydrologic units, which have been determined by the chief engineer to be fully appropriated based on the safe yield criteria, shall be closed to further new surface water and groundwater appropriations except for domestic use, temporary permits, and term permits for five years or less:

(A) Big Creek, its tributaries and their valley alluviums, and any other aquifer that has a substantial hydraulic connection to an alluvium;

(B) Beaver Creek and Little Beaver Creek, their tributaries and their alluviums, and any other aquifer that has a substantial hydraulic connection to an alluvium;

(C) North Fork Solomon River, its tributaries and their alluviums, and any other aquifer that has a substantial hydraulic connection to an alluvium;

(D) Prairie Dog Creek, its tributaries and their alluviums, and any other aquifer that has a substantial hydraulic connection to an alluvium;

(E) Sappa Creek, its tributaries and their alluviums, and any other aquifer that has a substantial hydraulic connection to an alluvium;

(F) South Fork of the Solomon River, its tributaries and their alluviums above Glen Elder Dam, and any other aquifer that has a substantial hydraulic connection to an alluvium; and

(G) Walnut Creek, its tributaries and their alluviums, and other hydraulically connected aquifers outside the boundaries of the intensive groundwater use control area created by order of the chief engineer shall be those set forth below:

Section	Township	Range	County
28 through 33	18S	23W	Barton
4 through 10 and 14 through 36	18S	14W	Barton
1 through 36	18S	25W	Barton

(6) "Technical guidelines for determining the availability of groundwater for appropriation in the Lower Republican River Basin and Belleville Formation and the availability of surface water for appropriation in the Lower Republican River Basin," adopted by the chief engineer, division of water resources, Kansas department of agriculture, on October 1, 1999, is hereby adopted by reference as determining the availability of groundwater for appropriation in the lower Republican River basin and Belleville formation and the availability of surface water for appropriation in the lower Republican River basin.

(7) (A) All applications for a permit to appropriate groundwater from the area described in paragraph (7) (B) for any beneficial use, except for domestic use, temporary permits, and short-term permits for five or fewer years, shall be accepted for filing and given a file number, if acceptable for filing. The application shall be returned by the chief engineer, and the reason that the application will be denied shall be specified by the chief engineer. The applicant shall be given 30 days to show cause why the application should not be denied. If the applicant does not show good cause, the application shall be dismissed.

(B) The area is described as sections 17, 18, 19, 20, township 7 south, range 6 west, and sections 13, 14, township 7 south, range 7 west, all in Mitchell County, Kansas.

(C) All applications for permits to appropriate groundwater from sections 29 and 30 in township 7 south, range 6 west, and sections 12, 15, 16, 21, 22, 23, 24, 25, 26, and 27 in township 7 south, range 7 west, all in Mitchell County, Kansas, for any beneficial use, except for domestic use, temporary permits, and term permits for five or fewer years, shall be processed based on the criteria set forth below in paragraph (7) (D).

(D) No new wells shall be allowed in the area described in paragraph (7) (C) above if the proposed well would produce one foot or more of additional drawdown at any existing well in that area and if the proposed well was pumped continuously for 45 days (1,080 hours) at the rate requested on the application. This analysis shall be done by using the Theis equation, with a coefficient of transmissivity of 71,000 gallons per day per foot (gpd/ft) and a coefficient of storage of 0.02.

(E) Any application for a change in the point of diversion filed for a well located in the areas described in paragraphs (7) (B) and (C) above shall be limited to a move of no more than 100 feet, unless the applicant can show the chief engineer that the proposed move will not prejudicially and unreasonably affect the public interest, will not impair existing water rights, and otherwise complies with the provisions of K.S.A. 82a-708b, and amendments thereto. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-711; effective Nov. 28, 1994; amended Sept. 22, 2000.)

5-3-12. (Authorized by K.S.A. 82a-701(g), 82a-706a; effective May 1, 1980; revoked May 1, 1987.)

5-3-13. Dewatering of construction sites. The chief engineer shall limit the time in which water may be withdrawn for dewatering purposes. Any water right that may be perfected by the dewatering project shall be deemed abandoned and terminated upon the completion of the dewatering project. Any extension of time in which to complete the project must be requested in writing by the applicant prior to the expiration date on the permit. (Authorized by K.S.A. 82a-706a, 82a-712; effective May 1, 1980.)

5-3-14. Availability of water for appropriation - safe yield; confined groundwater aquifers. (a) Each application to appropriate water from a confined aquifer shall be processed on a case by case basis so that the safe yield of the source of water supply is not exceeded.

(b) Until a specific regulation is adopted by the chief engineer for the confined source of water supply, the analysis shall be made using the best information reasonably available to the chief engineer. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1993 Supp. 82a-711; effective Nov. 28, 1994.)

5-3-15. Availability of water for appropriation - safe yield; surface water. (a) Each application filed to directly divert the natural flow of the Kansas river, the Missouri river, the Big Blue river, the Spring river, or their tributaries, shall:

(1) be processed in accordance with K.A.R. 5-3-9; and

(2) meet all other requirements for the approval of a new application.

(b) The water right owner shall be required by the chief engineer to meet minimum desirable streamflows (MDS), assurance district target flows (assurance target flows) and division of wa-

ter resources (DWR) target flows where applicable.

(c) Each application filed to directly divert the natural flow from any stream or tributary in the state of Kansas, except those streams listed in paragraph (a) of this regulation, shall have the following conditions of approval.

(1) If MDS or assurance target flows or DWR target flows have been set for that stream, and MDS administration has been requested by the Kansas water office, diversion of natural flow shall only be permitted if MDS, assurance target flows or DWR target flows, if applicable, are being met at the gage or gages immediately below the proposed point of diversion.

(2) Diversion of natural flow shall not take place unless there is water available to satisfy all demands by senior water rights and permits.

(3) The streamflow shall not be stopped at the first riffle below the point of diversion while diversion is taking place under the authority of that water right or permit.

(4) During the period October 1 through June 30, the verbal or written permission of the chief engineer, or an authorized representative of the chief engineer, shall be obtained in order to divert water each time the applicant desires to divert water.

(5) The applicant shall be required to demonstrate that the direct diversion of streamflow is not necessary during the period July 1 through September 30 each calendar year because of lack of need; the availability of adequate water storage or alternative water supplies; or other similar reasons.

(6) During the period July 1 through September 30 each calendar year, no direct diversions of water shall be permitted unless written permission is obtained from the chief engineer or the chief engineer's authorized representative.

(d) Each application filed by a member of an operational assurance district for that stream shall be processed taking into consideration the provisions of the assurance district contract.

(e) Each application filed for a point of diversion which might divert water released from storage pursuant to an agreement between the state of Kansas and the federal government shall be processed taking into consideration the provisions of that agreement.

(f) Each application filed to divert the natural flow of any stream subject to a more specific regulation adopted by the chief engineer or an intensive groundwater use control area order issued by the chief engineer, for a basin or portion thereof, shall be processed in accordance with the provisions of that regulation or order. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1993 Supp. 82a-711; effective Nov. 28, 1994.)

5-3-16. Safe yield; exemptions for up to 15 acre-feet of groundwater. In any area of the state outside a groundwater management district that is subject to safe yield criteria and is not closed by regulation or intensive groundwater use control area order by the chief engineer to new nondomestic, nontemporary permits and term permits for five or fewer years, applications to appropriate groundwater shall be exempt from meeting the safe yield criteria if the chief engineer finds that all of the following conditions are met:

(a) The sum of the annual quantity requested by the proposed appropriation and the total annual quantities authorized by prior permits allowed because of an exemption pursuant to this regulation does not exceed 15 acre-feet in a ½-mile-radius circle surrounding the proposed point of diversion.

(b) Well spacing criteria in the area have been met.

(c) The approval of the application does not authorize an additional quantity of water out of an existing authorized well with a nondomestic permit or water right, which would result in a total combined annual quantity of water authorized from that well in excess of 15 acre-feet.

(d) All other criteria for processing a new application to appropriate water at that location have been met. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-711; effective Nov. 28, 1994; amended Sept. 22, 2000.)

5-3-16a. Closed areas; exemptions for up to five acre-feet of groundwater. In any area of the state that is outside a groundwater management district and an intensive groundwater use control area (IGUCA) and that is closed to new appropriations of groundwater by regulation except for domestic use, temporary permits, and term permits for five or fewer years, applications to appropriate groundwater shall be exempt from meeting the safe yield criteria and the regulation closing the area to new appropriations if the chief engineer finds that all of the following criteria are met: (a) The sum of the annual quantity of water requested by the proposed appropriation and the total annual quantities of water au-

thorized by prior approvals of applications allowed because of an exemption pursuant to this regulation does not exceed five acre-feet in a two-mile-radius circle surrounding the proposed point of diversion.

(b) The annual quantity of water requested is reasonable for the proposed beneficial use of water.

(c) All other criteria for processing a new application to appropriate water at that location, including well spacing criteria, have been met.

(d) The approval of the application does not authorize an additional quantity of water out of an existing well that would result in a total combined annual quantity of water authorized from that well in excess of five acre-feet per calendar year.

(e) The proposed beneficial use of water will significantly benefit the public interest and help maximize economic development. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a, K.S.A. 2002 Supp. 82a-711, and K.S.A. 2002 Supp. 82a-1904; effective Oct. 24, 2003.)

5-3-17. Safe yield; miscellaneous exemptions. In any area of the state which is subject to safe yield criteria, and outside a groundwater management district or an intensive groundwater use control area closed to new non-domestic, non-temporary uses, each application to appropriate groundwater for a beneficial use shall be exempt from meeting the safe yield criteria if the chief engineer finds that:

(a) the proposed use has occurred continuously since prior to the effective date of this regulation;

(b) the proposed use could have reasonably been classified by the division of water resources as a domestic use at the time the use began; and

(c) all other requirements in effect for the approval of a new application to appropriate water at that location have been met. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1993 Supp. 82a-711; effective Nov. 28, 1994.)

5-3-18. Applicant's opportunity to submit additional information. (a) If at any stage of processing an application, it is determined by the chief engineer that an application does not meet the safe yield criteria, the applicant shall be notified by the chief engineer in writing prior to denial of the application that the safe yield requirements have not been met and the reason for the proposed denial. In this written notice, the chief engineer shall allow the applicant 15 days to request time in which to submit additional information to show why the application should be approved.

(b) Within 15 days the applicant shall either submit the additional information or file a written request for a reasonable amount of time to submit an engineering report or similar type of hydrologic analysis to show that approval of the application will not cause the safe yield of the source of water supply to be exceeded.

(c) If the applicant fails to timely show to the satisfaction of the chief engineer that the application can be approved, then the application shall be denied by the chief engineer. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1993 Supp. 82a-711; effective Nov. 28, 1994.)

5-3-19. Maximum reasonable annual quantity of water for irrigation use. (a) For applications filed before the effective date of this regulation, the maximum annual quantity of water reasonably necessary to irrigate crops shall be determined as follows:

(1) In that area of Kansas located between the eastern border of Kansas and the western border of range 6 east, the maximum reasonable annual quantity of water shall not exceed one acre-foot of water per acre irrigated.

(2) In that area of Kansas located between the eastern border of range 5 east and the western border of range 20 west, the maximum reasonable annual quantity of water shall not exceed 1½ acre-feet of water per acre irrigated.

(3) In that area of Kansas located between the eastern border of range 21 west and the western border of Kansas, the maximum reasonable annual quantity of water shall not exceed two acre-feet of water per acre irrigated.

(b) On and after the effective date of this regulation, the maximum annual quantity of water reasonably necessary to irrigate crops shall be determined by multiplying the number of irrigated acres by the county value found on the map adopted by reference in K.A.R. 5-3-24. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a, K.S.A. 82a-707(e), and K.S.A. 2002 Supp. 82a-711; effective Sept. 22, 2000; amended Oct. 24, 2003.)

5-3-20. Maximum reasonable annual quantity of water approvable for a new appropriation of water for irrigation use. (a) The maximum reasonable annual quantity of water that may be approved for use on irrigated land for

applications filed before the effective date of this regulation shall be limited to the following:

(1) The quantity of water available for appropriation as determined by the safe yield, allowable appropriation or similar type of limitation adopted by regulation of the chief engineer for the area in which the proposed point of diversion will be located;

(2) the quantity of water reasonably physically available from the source of water supply based on the physical characteristics of the source of water supply and the proposed diversion works; and

(3) the quantity of water reasonably necessary to irrigate crops in the region of the state where the proposed place of use is located as set forth in K.A.R. 5-3-19(a). The authorized quantity shall be determined by multiplying the number of acres approved to be irrigated by the quantity per acre set forth in K.A.R. 5-3-19(a).

(b) The maximum reasonable annual quantity of water that may be approved for use on irrigated land for applications filed on or after the effective date of this regulation shall be limited to the following:

(1) The quantity of water available for appropriation as determined by the safe yield, allowable appropriation or similar type of limitation adopted by regulation of the chief engineer for the area in which the proposed point of diversion will be located;

(2) the quantity of water reasonably physically available from the source of water supply based on the physical characteristics of the source of water supply and the proposed diversion works; and

(3) the quantity of water reasonably necessary to irrigate crops in the region of the state where the proposed place of use is located as set forth in K.A.R. 5-3-19(b).

(c) The quantity specified in subsection (a) or (b) may be exceeded only if the applicant demonstrates both of the following to the chief engineer:

(1) Because of specialty crops or other unusual conditions, the quantity specified in K.A.R. 5-3-19 is insufficient.

(2) The requested quantity is reasonable for the intended irrigation use, is not wasteful, and will not otherwise prejudicially and unreasonably affect the public interest. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-707(e), K.S.A. 1999 Supp. 82a-711, and K.S.A. 82a- 712; effective Sept. 22, 2000.)

5-3-21. Perfection of a water right for irrigation use. (a) For applications with a priority date before the effective date of this regulation, the maximum reasonable annual quantity of water that may be perfected for irrigation use shall not exceed the following:

(1) The maximum annual quantity of water actually applied to beneficial use in any one calendar year in accordance with the terms, conditions, and limitations of the approval of application during the perfection period; and

(2) the quantity of water reasonably necessary to irrigate crops in the region of the state where the place of use is located as set forth in K.A.R. 5-3-19(a). The reasonable quantity shall be determined by multiplying the number of acres actually irrigated during the year of record by the quantity per acre as set forth in K.A.R. 5-3-19(a).

(b) For applications with a priority date on or after the effective date of this regulation, the maximum reasonable annual quantity of water that may be perfected for irrigation use shall not exceed the following:

(1) The maximum annual quantity of water actually applied to beneficial use in any one calendar year in accordance with the terms, conditions, and limitations of the approval of application during the perfection period; and

(2) the quantity of water reasonably necessary to irrigate crops in the region of the state where the place of use is located as set forth in K.A.R. 5-3-19(b). The reasonable quantity shall be determined by multiplying the number of acres actually irrigated during the year of record by the quantity per acre set as forth in K.A.R. 5-3-19(b).

(c) The quantity specified in subsection (a) or (b) may be exceeded only if the water right owner demonstrates both of the following to the chief engineer:

(1) Because of specialty crops or other unusual conditions, the quantity specified in K.A.R. 5-3-19 was insufficient.

(2) A greater quantity was reasonable for the intended irrigation use, was not wasteful, and did not otherwise prejudicially and unreasonably affect the public interest. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-707(e) and K.S.A. 1999 Supp. 82a-714; effective Sept. 22, 2000.)

5-3-22. Maximum reasonable quantity of water for livestock and poultry. (a) The following quantities shall be deemed the maximum

quantity of water reasonable for nondomestic livestock and poultry water use:

Livestock/ poultry	Drinking water (gallons per head per day)	Additional quantities for servicing/flushing (gallons per head per day)
Cattle, beef	15	0 (open lot) 100 [confined building capacity (cbc)]
Cattle, dairy	35	100 (cbc)
Swine		
finishing	5	15 (cbc)
nursery	1	4 (cbc)
sow and litter	8	35 (cbc)
gestating sow	6	25 (cbc)
Sheep	2	0 (open lot) 15 (cbc)
Horses	12	0 (open lot) 100 (cbc)
Poultry		
chickens (100	9	200 (cbc)
layers)	30	400 (cbc)
turkeys (100)		

(b) The maximum reasonable quantity of water that may be approved for nondomestic livestock and poultry use for applications approved on or after the effective date of this regulation shall be limited as set forth in subsection (a) above. The quantities set forth in subsection (a) may be exceeded only if the applicant demonstrates both of the following to the chief engineer:

(1) The requested quantity is reasonable for the intended use.

(2) This quantity is not wasteful and will not otherwise prejudicially and unreasonably affect the public interest.

(c) For all other types of nondomestic livestock, poultry, birds, and animals, the maximum quantity of water approved for beneficial use shall be reasonable.

(d) The maximum reasonable quantity of water that may be perfected for nondomestic livestock or poultry use shall not exceed the quantities set forth in subsections (a), (b) and (c) above, unless the water right owner demonstrates both of the following to the chief engineer:

(1) A larger quantity of water was actually applied to beneficial use within the terms, conditions, and limitations of the permit within the perfection period.

(2) The quantity used was not wasted. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-707(e), K.S.A. 1999 Supp. 82a-711, K.S.A. 82a-712, and K.S.A. 1999 Supp. 82a-714; effective Sept. 22, 2000.)

5-3-23. Maximum reasonable annual quantity approvable for irrigation use for an application for change in place of use and a request to reduce a water right. (a) Except as provided in subsections (c), (d), and (e), for water rights with a priority date before the effective date of this regulation, the maximum reasonable annual quantity of water that may be approved for either of the following shall be that quantity of water reasonably necessary to irrigate crops in the region of the state where the proposed place of use is located as set forth in K.A.R. 5-3-19(a):

(1) An application for change in place of use for irrigation filed pursuant to K.A.R. 82a-708b and amendments thereto; or

(2) a request to reduce the authorized place of use for irrigation for a water right filed pursuant to K.A.R. 5-7-5.

(b) Except as provided in subsections (c), (d), and (e), for water rights with a priority date on or after the effective date of this regulation, the maximum reasonable annual quantity of water that may be approved for either of the following shall be that quantity of water reasonably necessary to irrigate crops in the region of the state where the proposed place of use is located as set forth in K.A.R. 5-3-19(b):

(1) An application for change in place of use for irrigation filed pursuant to K.A.R. 82a-708b and amendments thereto; or

(2) a request to reduce the authorized place of use for a water right filed pursuant to K.A.R. 5-7-5.

(c) The maximum reasonable quantities approvable in subsections (a) and (b) above shall not exceed either of the following:

(1) The applicable quantity set forth in either subsection (a) or (b) above; or

(2) the maximum quantity of acre-feet per acre authorized by the vested water right or certificate of appropriation, whichever is greater. The maximum authorized quantity of acre-feet per acre shall be calculated by dividing the maximum annual quantity of water authorized at the time the application for change or request to reduce is filed by the number of acres authorized at the time the application for change is filed.

(d) The quantities set forth above in subsections (a), (b), and (c) above may be exceeded only if the

applicant demonstrates both of the following to the chief engineer:

(1) Because of specialty crops or other unusual conditions, the quantity specified in K.A.R. 5-3-19(a) is insufficient.

(2) The requested quantity is reasonable for the intended irrigation use, is not wasteful, and will not otherwise prejudicially and unreasonably affect the public interest.

(e) The maximum annual quantity of water approved pursuant to this regulation shall not exceed the maximum annual quantity of water authorized by the water right at the time the change application is approved. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-707(e) and K.S.A. 1999 Supp. 82a-708b; effective Sept. 22, 2000.)

5-3-24. Reasonable quantity for irrigation use. The Kansas department of agriculture, division of water resources' map titled "reasonable quantities for irrigation use in Kansas, by county," dated October 21, 1999, is hereby adopted by reference. (Authorized by K.S.A. 82a- 706a; implementing K.S.A. 82a-707(e), K.S.A. 1999 Supp. 82a-711, and K.S.A. 1999 Supp. 82a-714; effective Sept. 22, 2000.)

5-3-25. Conditions on permits and certificates. (a) All terms, conditions, and limitations placed on an approval of application by the chief engineer pursuant to the provisions of K.S.A. 82a-712, and amendments thereto, shall remain in full force and effect until expressly modified or removed by the chief engineer.

(b) Unless the terms and conditions are expressly modified or removed by the subsequent approval, certification, or other order of the chief engineer, none of the following shall modify or remove any of the terms, conditions, and limitations placed on the original approval of applications or water right:

(1) The approval of an application to change the place of use, the point of diversion, or the use made of water under the authority of K.S.A. 82a-708b and amendments thereto;

(2) the issuance of a certificate of appropriation pursuant to K.S.A. 82a-714 and amendments thereto; or

(3) the issuance of any other findings and order relative to the approval of application or water right. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-708b, K.S.A. 1999 Supp. 82a-711, K.S.A. 82a-712, and K.S.A. 1999 Supp. 82a-714; effective Sept. 22, 2000.)

5-3-26. Closed townships in Pawnee and Buckner drainage basins in Pawnee, Hodgeman, Ness, and Finney counties. (a) Except as specified in subsection (c), the following townships in the Pawnee and Buckner drainage basins shall be closed to new appropriations of water:

(1) T 20 S:

(A) R 19 W through R 26 W;

(B) R 18 W, section 7 and sections 17 through 36; and

(C) R 17 W, section 31;

(2) T 21 S:

(A) R 30 W, sections 1 through 4, 9 through 16, 21 through 28, and 33 through 36;

(B) R 21 W through R 29 W;

(C) R 20 W and R 19 W, sections 1 through 6; and

(D) R 18 W, sections 1 through 24;

(3) T 22 S:

(A) R 30 W, sections 1 through 4, 9 through 16, 21 through 28, and 33 through 36;

(B) R 21 W through R 29 W;

(C) R 19 W and R 20 W, sections 13 through 36;

(D) R 18 W, sections 20 through 36; and

(E) R 17 W, sections 20, 21, and 30;

(4) T 23 S:

(A) R 22 W through R 26 W;

(B) R 21 W, sections 1 through 24, and 27 through 32;

(C) R 20 W, sections 1 through 18;

(D) R 19 W, sections 1 through 12 and 14 through 18; and

(E) R 18 W, sections 3 through 10; and

(5) T 24 S:

(A) R 23 W through R 26 W;

(B) R 22 W, sections 1 through 23 and 26 through 35; and

(C) R 21 W, sections 5, 6, and 7.

(b) Except as specified in subsection (c), all new applications that propose a point of diversion in any of the areas described in subsection (a) that are pending approval on the effective date of this regulation shall be dismissed.

(c) The closure of the townships listed in subsection (a) to new appropriations of water shall not apply to the following types of wells:

(1) Wells for domestic use;

(2) wells authorized by temporary permits; and

(3) wells authorized by term permits of fewer than five years.

This regulation shall be effective on and after October 25, 2002. (Authorized by K.S.A. 82a-

706a; implementing K.S.A. 2001 Supp. 82a-711 and K.S.A. 82a-721; effective Sept. 22, 2000; amended, T-5-6-27-02, June 27, 2002; amended Oct. 25, 2002.)

5-3-27. Equus Beds special groundwater quality area. (a) A special groundwater quality area located within the boundaries of the Equus Beds groundwater management district no. 2 shall be hereby established in the following area consisting of approximately 36 square miles in northwest Harvey County, south-central McPherson County, and northeast Reno County, Kansas:

(1) Sections 3 through 10, 15 through 22, and 27 through 34, of township 22 south, range 3 west, Harvey County;

(2) sections 31 through 34, township 21 south, range 3 west, and section 36, township 21 south, range 4 west, McPherson County; and

(3) sections 1, 12, 13, 25, 26, and 36, township 22 south, range 4 west, Reno County, Kansas.

(b) Each application for a new appropriation of groundwater, a newly constructed well, or a change in the point of diversion for a well within the area shall be reviewed by the chief engineer to determine the effect of the proposed appropriation or well on the movement of saltwater pollution in the area.

(c) A test well log shall accompany each type of application described in subsection (b) within the area described in subsection (a) above and shall include the following information:

(1) Depth to bedrock;

(2) a water quality analysis of water taken from the bottom 20 feet of the aquifer, including sodium and chloride concentrations; and

(3) a water quality analysis of water taken within the top 20 feet of the aquifer, including specific conductance and chloride concentrations.

(d) If the chief engineer can not determine whether the proposed application will affect the movement of saltwater pollution in the area in a manner that is adverse to the public interest or that will cause impairment to other water rights by causing an unreasonable deterioration of the water quality, then the applicant shall submit any information the chief engineer needs to make that determination. The information shall be submitted within a reasonable time period specified by the chief engineer.

(e) The chief engineer shall submit the proposed application to the board of the Equus Beds groundwater management district no. 2 for its review and recommendation. The board shall have 30 days to review the application and provide its recommendation to the chief engineer. The recommendation of the board shall be considered by the chief engineer in making a decision as to whether the application can be approved as filed or modified.

(f) The application shall be dismissed and its priority forfeited if either of the following conditions is met:

(1) The chief engineer determines that approval of the application will affect the movement of saltwater pollution in the area in a manner that will prejudicially and unreasonably affect the public interest or that will cause impairment to other water rights by causing an unreasonable deterioration of the water quality because of saltwater pollution.

(2) The applicant fails to submit the information requested by the chief engineer within the time specified.

(g) The application shall be approved if both of the following conditions are met:

(1) The chief engineer determines that the approval of the application, as filed or modified, will not affect the movement of saltwater pollution in the area in a manner that is adverse to the public interest and will not cause impairment to other water rights by causing an unreasonable deterioration of the water quality because of saltwater pollution.

(2) The application meets all other statutory and regulatory criteria.

(h) In addition to reporting the information normally required in the water use reports required by K.S.A. 82a-732, and amendments thereto, each owner of a water right or approval of application shall also report the depth to the static water level in each well, in a manner acceptable to the chief engineer.

(i) All groundwater diversion works permitted in the Equus Beds special groundwater quality area shall be equipped with a water flowmeter that meets the specifications adopted by the chief engineer, except for domestic wells, temporary wells, and wells authorized by term permits for fewer than five years. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706c, K.S.A. 82a-709, K.S.A. 82a-710, K.S.A. 1999 Supp. 82a-711, and K.S.A. 82a-732; effective Sept. 22, 2000.)

5-3-28. Lyons special groundwater quality area. (a) A special groundwater quality area

all in Rice County, Kansas, and partially located within the boundaries of the Big Bend groundwater management district no. 5 shall be hereby established in the following described area consisting of approximately 37 square miles in central Rice County, Kansas:

(1) Sections 33, 34, and 35 of township 19 south, range 8 west;

(2) sections 1-4, 9-16, 21-25, township 20 south, range 8 west;

(3) sections 7, 17-21, 27-34, township 20 south, range 7 west; and

(4) sections 3-5, township 21 south, range 7 west.

(b) Each application for a new appropriation of groundwater, a newly constructed well, or a change in point of diversion for a well proposed to be located within the area shall be reviewed by the chief engineer to determine whether the proposed appropriation will have any adverse effect on the movement and remediation of saltwater pollution south and east of Lyons, Kansas.

(c) A test well log shall accompany each type of application filed for a point of diversion described in subsection (b) that is proposed to be located within the area described in subsection (a), and shall include the following information:

(1) Depth to bedrock;

(2) a water quality analysis of water taken from the bottom 20 feet of the aquifer, including analysis of sodium and chloride concentrations; and

(3) a water quality analysis of water taken within the top 20 feet of the aquifer, including analysis of sodium and chloride concentrations.

(d) If the chief engineer can not determine whether the proposed application will affect the movement and cleanup of saltwater pollution south and east of Lyons in a manner that is adverse to the public interest or that will cause impairment to other water rights by causing an unreasonable deterioration of the water quality, then the applicant shall submit any information the chief engineer needs to make that determination. The information shall be submitted within a reasonable time period specified by the chief engineer.

(e) If the proposed point of diversion is located within the district, the proposed application shall be submitted by the chief engineer to the board of the district for review and recommendation. The board shall have 30 days to review the application and submit its recommendation to the chief engineer. The recommendation of the board shall be considered by the chief engineer in making a decision as to whether the application can be approved as filed or modified.

(f) The application shall be dismissed and its priority forfeited if either of the following conditions is met:

(1) The chief engineer determines that approval of the application will affect the movement and cleanup of saltwater pollution south and east of Lyons in a manner that prejudicially and unreasonably affects the public interest or that will cause impairment to other water rights by causing an unreasonable deterioration of the water quality because of saltwater pollution.

(2) The applicant fails to submit the information requested by the chief engineer within the time specified.

(g) The application shall be approved if both of the following conditions are met:

(1) The chief engineer determines that the approval of the application, as filed or modified, will not affect the movement and cleanup of saltwater pollution south and east of Lyons in a manner that would prejudicially and unreasonably affect the public interest and will not cause impairment to other water rights by causing an unreasonable deterioration of the water quality because of saltwater pollution.

(2) The application meets all other applicable statutory and regulatory criteria. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706c, K.S.A. 82a-709, K.S.A. 82a-710, K.S.A. 1999 Supp. 82a-711, and K.S.A. 82a-732; effective Sept. 22, 2000.)

5-3-29. Ozark and Springfield plateau aquifers. (a) Except as specified in subsections (b) and (c), the Ozark aquifer and the Springfield plateau aquifer in the following townships in Cherokee, Crawford, Allen, Bourbon, Neosho, and Labette counties in Kansas shall be closed to new appropriations of water: ranges 20 east through 25 east and townships 26 south through 35 south.

(b) The closure of townships listed in subsection (a) to new appropriations of water shall not apply to the following types of wells:

(1) Wells for domestic use;

(2) wells authorized by temporary permits;

(3) wells meeting the requirements of K.A.R. 5-3-16a; and

(4) wells meeting both of the following conditions:

(A) Are authorized by a term permit of five or fewer years, which can be extended by the chief engineer not beyond December 31, 2010, and over which the chief engineer retains jurisdiction to dismiss or amend if necessary to prevent impairment of the water quantity, rate, or quality or to otherwise protect the public interest; and

(B) are used as an alternate source of water supply that is actively being planned, financed, and constructed and that will be available no later than December 31, 2010.

(c) Notwithstanding the provisions of paragraph (b)(4)(A), the term permits may be extended by the chief engineer beyond December 31, 2010 or may be converted by the chief engineer to regular permits to appropriate water, if both of the following conditions are met:

(1) A study has been completed before December 31, 2010, determining the safe yield of the Ozark aquifer and the Springfield plateau aquifer.

(2) Extending the term of the term permit or converting the term permit to a regular permit to appropriate water will not result in any of the following:

(A) Causing the safe yield to be exceeded;

(B) impairing prior permits or water rights; or

(C) prejudicially and unreasonably affecting the public interest. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-711; effective, T-5-8-23-04, Aug. 23, 2004; effective Nov. 29, 2004.)

Article 4.—DISTRIBUTION OF WATER BETWEEN USERS

5-4-1. Distribution of water between users where a prior right is being impaired. When a complaint is received that a prior right to the use of water is being impaired, the following procedure shall be followed:

1. The complaint shall be made to the chief engineer or his or her authorized representative. A complaint may be accepted verbally, in person or by telephone. No action shall be taken by the agency until the complaint is confirmed in writing.

2. An investigation of the physical conditions involved shall be made by the chief engineer or his or her authorized representative.

3. A written report of the investigation shall be prepared and a copy given to the complainant. If the investigation shows there is no basis for further action by the division the complainant shall be so advised.

4. The complainant shall make a written request to secure water to satisfy his or her prior right.

5. The chief engineer or his or her authorized representative shall give a written legal notice and directive to other water users whose use of water must be regulated to secure water to satisfy the complainant's prior rights.

The request to secure water shall be made on a prescribed form furnished for that purpose by the division of water resources. All water delivered to the user's point of diversion for his or her use at the specified rate or less shall be applied to the authorized beneficial use and count against the quantity of water specified unless the user notifies the chief engineer or his or her authorized representative that diversion and use will be discontinued for a period of time for good reason.

When the quantity of water needed has been delivered to the user's point of diversion or when the user discontinues his or her use of water, those persons who have been directed to regulate their use shall be notified that they may resume the diversion and use of water.

If the available water supply in the source should increase, the chief engineer or his or her authorized representative may allow some or all of the users regulated to resume use depending on the supply. (Authorized by K.S.A. 82a-706a; modified, L. 1978, ch. 460, May 1, 1978.)

5-4-4. Well spacing. (a) The spacing between wells shall be sufficient to prevent direct impairment between wells located in a common source of supply or hydraulically connected sources of supply and to protect the public interest. Except as set forth in subsection (b), the following guidelines shall be used to determine the spacing required between wells permitted by the chief engineer in a common source of supply, unless it is determined by the chief engineer in any specific instance that the spacing guidelines set forth in this regulation are insufficient to prevent direct impairment or are not necessary to prevent direct impairment.

(b) Whenever an applicant proposes to divert water from a source of supply in a location where there is a significant hydraulic connection between the proposed source of supply and another source or sources of supply, the chief engineer shall determine the spacing necessary to prevent impairment and to protect the public interest on a case by case basis.

(c) Except as set forth in subsection (e) below, each well that is described in an application for a permit to appropriate water for beneficial use or for a term permit, excluding any domestic or temporary well, shall meet the minimum spacing requirements set out in paragraphs (1) and (2) below.

(1) The minimum distance from the well which is the subject of the application to all other senior authorized non-domestic and non-temporary wells in the same aquifer or a hydraulically connected aquifer shall be:

(A) four miles between wells whose common source of supply is the confined Dakota aquifer system;

(B) one-half mile between wells whose common source of supply is the unconfined Dakota aquifer system; and

(C) 1320 feet for wells whose common source of supply is any other aquifer.

(2) In addition to meeting the minimum spacing requirements of paragraph (1) above, the minimum distance from the well which is the subject of the application to all domestic wells, except where the domestic well owner has given the applicant written permission to reduce the spacing interval, shall be:

(A) one-half mile for wells whose common source of supply is the confined Dakota aquifer system;

(B) 1320 feet for wells whose common source of supply is the unconfined Dakota aquifer system; and

(C) 660 feet for wells whose common source of supply is any other aquifer.

(d) Except as provided in subsection (e), the location of a well or wells on an application to change the point of diversion under an existing water right shall either:

(1) meet the spacing requirements in paragraphs (c)(1) and (c)(2) above; or

(2) not decrease the distance to other wells or authorized well locations by more than 300 feet.

(e) This regulation shall not apply if the chief engineer has adopted another regulation, or issued an order pursuant to K.S.A. 82a-1036 *et seq.*, specifying a different well spacing for the source of supply in which the proposed point of diversion is located.

(f) In the case of a battery of wells, the distance shall be measured from the geographic center of the points of diversion comprising the battery.

(g) If the proposed point of diversion does not meet the well spacing requirements in this regulation, the applicant shall be notified by the chief engineer in writing prior to dismissal that the requirements have not been met. The applicant shall then have 15 days to request time in which to submit additional information. Upon written request, the applicant shall be given a specified reasonable amount of time by the chief engineer to submit an engineering or similar type of hydrologic analysis to show that the spacing can be decreased without impairing existing rights or prejudicially and unreasonably affecting the public interest. The burden shall be on the applicant to make such a showing to the satisfaction of the chief engineer. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1993 Supp. 82a-711; effective May 31, 1994.)

5-4-5. Approval of application for additional rate only. (a) Except as set forth in subsection (c), an application for a permit to appropriate water for beneficial use that requests only an increase in the authorized rate of diversion, and no net increase in maximum annual quantity, from a specific point of diversion already authorized by another water right or approval of application shall be exempt from complying with any safe yield, allowable appropriation, or similar type of criteria adopted by the chief engineer if both of the following conditions are met:

(1) The application requests only an increase in the authorized maximum rate of diversion of 15 percent or less.

(2) There has been no significant physical enlargement of the capacity of the original diversion works to divert water. If a well has been replaced, reconstructed, and reequipped in accordance with an approval of an application for change by the chief engineer pursuant to K.S.A 82a-708b and amendments thereto in substantially the same way that the original diversion works were constructed, that type of well shall not be considered to be a significant physical enlargement of the diversion works. Conversion to a battery of wells or adding an additional well shall be considered to be a significant physical enlargement of the capacity of the diversion works.

(b) Except as set forth in subsection (c), an application to increase the rate of diversion by more than 15 percent that requests no net increase in maximum annual quantity from a specific point of diversion already authorized by another water right or approval of application shall be exempt

from complying with any safe yield, allowable appropriation, or similar type of criteria adopted by the chief engineer if the conditions in either paragraph (b)(1) or (2) are met:

(1)(A) The application was filed within the time authorized to perfect any water right authorizing that point of diversion.

(B) The application is filed to increase the authorized maximum rate of diversion to the rate the original diversion works were physically capable of diverting water under actual maximum operating conditions, or less.

(2) The appropriator demonstrates to the chief engineer that authorizing an increase in the rate of diversion meets the following criteria:

(A) Will not impair existing water rights;

(B) will not prejudicially and unreasonably affect the public interest; and

(C) will not substantially increase the consumptive use in violation of K.A.R. 5-5-3.

(c) If the chief engineer adopts a regulation pertaining to applications for additional rate only for a specific groundwater management district, or issues an order concerning that type of application pursuant to an intensive groundwater use control area (IGUCA) proceeding authorized by K.S.A. 82a-1036 et seq. and amendments thereto, the application for additional rate shall be processed by the chief engineer pursuant to the provisions of that regulation or IGUCA order. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-701(f), K.S.A. 1999 Supp. 82a-711, K.S.A. 82a-712, K.S.A. 82a-1036, K.S.A. 82a-1037, K.S.A. 1999 Supp. 82a-1038, K.S.A. 82a-1039, and K.S.A. 82a-1040; effective Sept. 22, 2000.)

5-4-8. Custodial care of the state. (a) For any groundwater or surface water right placed in the custodial care of the state, the following criteria shall be met by the chief engineer:

(1) Not reappropriate the water authorized to be diverted by a water right in the custodial care of the state;

(2) continue to include the priority, terms, limitations, authorized rate and quantity, and other conditions of the water right in any analysis or action conducted for the permitting, management, regulation, or administration of other water rights or applications to appropriate water;

(3) not declare the water right abandoned for the nonuse of water. Placement of the water right in the custodial care of the state shall be deemed to be due and sufficient cause for nonuse of a water right pursuant to K.S.A. 82a-718 and amendments thereto; and

(4) not dismiss the water right, unless the chief engineer determines that the geographic area in which the water right is located no longer meets the requirements of K.S.A. 2-1919(2), and amendments thereto, and reopens the area to new appropriations of water.

(b) A water right owner desiring to place a portion of an existing water right in the custodial care of the state shall request the division to divide the water right. Each portion of a divided water right shall be treated as a separate water right and administered accordingly. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-707(d) and K.S.A. 1999 Supp. 82a-718; effective Sept. 22, 2000.)

Article 5.—CHANGE IN THE PLACE OF USE, THE POINT OF DIVERSION OR THE USE MADE OF WATER UNDER AN EXISTING WATER RIGHT

5-5-1. Filing an application for change. (a) An application for approval to change the place of use, the point of diversion, the use made of water, or combinations thereof, filed pursuant to K.S.A. 82a-708b and amendments thereto, shall be made on a form prescribed by the chief engineer and shall include whatever information is required by the chief engineer to properly understand the proposed change in the place of use, the point of diversion, the use made of water, or any combination of these.

(b) Before the application may be accepted for filing, the application shall be signed by at least one owner of the water right, or a duly authorized agent of an owner.

(c) Except as set forth in subsection (e), before any approval of an application can be granted, all of the water right owners, including their spouses, or a duly authorized agent of the owners of the water right, shall verify upon oath or affirmation that the statements contained in the application are true and complete.

(d) If one or more owners refuse to sign the application, or a written request is filed by one or more owners to withdraw their signatures from the application before the application is approved, the application shall be dismissed.

(e) (1) An application to change the location of a groundwater point of diversion that proposes to do only the following shall be signed by at least

one owner of the approval of application or water right, or the duly authorized agent, who verifies upon oath or affirmation all of the items specified below in paragraph (e)(2):

(A) Move the location of the well 300 or fewer feet; and

(B) have the new well located on land owned by all the same owners as the owners of the original point of diversion.

(2) (A) The signer of the application for change has the authority to sign the application on behalf of all the owners.

(B) None of the ownership interests of any of the owners of the approval of application or water right will be adversely affected if the application for change is approved as filed.

(C) If the application is not approved expeditiously, there will be substantial damage to property, public health, or safety. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-708b; modified, L. 1978, ch. 460, May 1, 1978; amended Sept. 22, 2000.)

5-5-2. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-708b; effective May 1, 1980; revoked May 1, 1983.)

5-5-2a. Complete change application. (a) An application to change a water right pursuant to K.S.A. 82a-708b, and amendments thereto, shall be considered to be a "complete application," if the application completely and accurately meets all of the requirements specified in this regulation and the following criteria:

(1) The requirements specified in K.S.A. 82a-708b, and amendments thereto;

(2) any water conservation plans required by the chief engineer pursuant to K.S.A. 82a-733, and amendments thereto;

(3) the requirements specified in K.A.R. 5-5-1;

(4) the requirements specified in K.A.R. 5-5-5;

(5) the requirements specified in K.A.R. 5-3-4d;

(6) a demonstration that the proposed point of diversion meets all applicable well spacing criteria; and

(7) the requirements of K.S.A. 82a-301 through K.S.A. 82a-305a, and amendments thereto, if the proposed point of diversion, or rediversion, is a dam or stream obstruction.

(b) If the applicant is requesting a waiver or exemption of a regulation pursuant to K.S.A. 82a-1904, and amendments thereto, the applicant shall submit a written request for the waiver or exemption, and documentation to support the waiver or exemption.

(c) If the proposed point of diversion is located within the boundaries of a groundwater management district, a final recommendation or an analysis of water availability has been received from the groundwater management district within the time allowed by the chief engineer concerning the approval, denial, or modification of the application.

(d) If any questions have been raised concerning whether approval of the application could cause impairment of senior water rights or prejudicially and unreasonably affect the public interest, the applicant shall submit sufficient information to resolve those questions.

(e) If any actions are required to be taken by the applicant on other approvals of applications or water rights owned by the applicant in order to make the application for change approvable, including dismissals, division agreements, reductions in water rights in accordance with K.A.R. 5-7-5, and applications for change, all necessary forms shall be completed and filed with the chief engineer.

(f) If the application involves a change in the place of use or the use made of water, the applicant shall submit all information and data necessary to ensure that the consumptive use will not be increased substantially in violation of K.A.R. 5-5-3.

(g) If the application proposes to add one or more additional wells in accordance with the provisions of K.A.R. 5-5-16, the applicant shall submit all tests, data, and information required by that regulation.

(h) If there is an issue as to whether the water right for which the change application has been filed has been abandoned in whole or in part pursuant to K.S.A. 82a-718, and amendments thereto, the applicant shall submit whatever information is necessary to resolve all abandonment issues.

(i) Each application shall be accompanied by an aerial photograph or a detailed plat with a scale of one inch equals 1,320 feet, or a U.S. geological survey topographic map with a scale of 1:24,000. The following information shall be plotted on the plat, photograph, or topographic map:

(1) The section corners;

(2) the center of the section, identified by the section number, township, and range;

(3) the actual location of the currently author-

ized point of diversion and the location of the proposed point of diversion indicated by appropriate symbols;

(4) the location of the place of use identified by crosshatching or by some other appropriate method;

(5) the location of all other water wells of every kind within one-half mile of the well or wells to be authorized by the proposed appropriation, each of which shall be identified by its use and the name and mailing address of the owner, if the proposed appropriation is for use of groundwater;

(6) the name and mailing address of the owner or owners of each tract of land adjacent to the stream for a distance of one-half mile upstream and one-half mile downstream from the property lines of the land owned or controlled by the applicant, if the proposed appropriation is for the use of surface water;

(7) the locations of proposed or existing dams, dikes, reservoirs, canals, pipelines, power-houses, and other structures for the purpose of storing, conveying, or using water; and

(8) a north arrow and scale.

All information shown on the photograph, plat, or map shall be legible. Black line prints may be submitted in lieu of the original drawing if a plat is submitted.

(j) The applicant shall certify on the application that all water wells of any kind located within one-half mile of the requested point of diversion have been plotted on the plat, photograph, or map attached to the application.

(k) The applicant shall submit all information and data necessary to demonstrate that the application complies with the applicable regulations adopted by the chief engineer. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a, K.S.A. 2002 Supp. 82a-708b, K.S.A. 82a-709, K.S.A. 82a-710, K.S.A. 2002 Supp. 82a-711, K.S.A. 2002 Supp. 82a-718, K.S.A. 82a-733, and K.S.A. 2002 Supp. 82a-1904; effective Oct. 24, 2003.)

5-5-3. Change in consumptive use. The extent of consumptive use shall not be increased substantially after a vested right has been determined or the time allowed in which to perfect the water right has expired, including any authorized extension of time to perfect the water right. (Authorized by K.S.A. 82a-706a, 82a-708b; effective May 1, 1983.)

5-5-4. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-708b; effective May 1, 1980; revoked May 1, 1981.)

5-5-5. Signatures required on change applications. If more than one person is the owner of a water right, and an application is filed for a change in the place of use, point of diversion, use made of the water, or any combination thereof, only the signature(s) of the landowner(s) whose portion of the water right(s) is (are) involved in the change shall be required on the application. If the extent of each owners interest in the water right has not been legally determined, then all landowners holding an undetermined portion of the water right must sign the change application or the landowners must submit an agreement signed by all landowners agreeing how the water right should be divided. (Authorized by K.S.A. 82a-706a, 82a-708b; effective May 1, 1980.)

5-5-6. Failure to construct diversion works at authorized location. (a) If an application to appropriate water for beneficial use is approved by the chief engineer, the location of the point of diversion shall be limited to a specific tract of land and to within 300 feet of a point identified in distances measured in feet north and west from the southeast corner of the legal section.

(b) If the diversion works were not constructed at the location authorized for the point of diversion, but the appropriator can demonstrate to the satisfaction of the chief engineer that all of the following criteria have been met, the authorized location shall be corrected to the actual location of the point of diversion by a correctional order issued by the chief engineer:

(1) The original application was filed before January 1, 1978.

(2) The diversion works were constructed before the date the original application to appropriate water was signed.

(3) It was not discovered that the actual diversion works were not constructed at the authorized point of diversion until after the application was approved.

(4) The diversion works were constructed at a location that could have been approved at the time the original application was filed based on the criteria in effect at the time the original application was filed.

(c) An application for a change in point of diversion filed pursuant to K.S.A. 82a-708b and amendments thereto shall be approved by the

chief engineer, authorizing the actual location where the diversion works were constructed and extending the time to construct the diversion works until the end of the calendar year in which the application to change the point of diversion was approved, if the diversion works were not constructed at the authorized location, but the appropriator can demonstrate to the satisfaction of the chief engineer that all of the following criteria have been met:

(1) The original application was filed with the chief engineer before January 1, 1978.

(2) The diversion works were completed after the application was filed, but within the time authorized to construct the diversion works.

(3) The diversion works were constructed within 1,320 feet of the authorized point of diversion.

(4) The diversion works were constructed at a location that could have been approved at the time that the original application was filed based upon the criteria in effect at the time the original application was filed.

(5) The change application meets the other criteria of K.S.A. 82a-708b and amendments thereto.

If the actual point of diversion is within a groundwater management district, the application shall be sent to the groundwater management district board for review and recommendation.

(d) The point of diversion shall be authorized at the actual location by approval of a new application to appropriate water by the chief engineer if the diversion works were not constructed at the authorized location, but the appropriator can demonstrate to the chief engineer that all of the following criteria have been met:

(1) The original application was filed on or after January 1, 1978.

(2) The diversion works were subsequently completed within the time authorized to complete the diversion works.

(3) The diversion works were constructed within 1,320 feet of the authorized point of diversion.

(4) The time authorized to complete the diversion works has expired.

(5) There is no water available for a new appropriation to be approved at the location of the actual point of diversion.

(6) The application would have met all the criteria for a new application that were in effect at the time the original new application was filed.

If the actual point of diversion is within a groundwater management district, the application shall be sent to the groundwater management district board for review and recommendation. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-708b, and K.S.A. 82a-728; effective May 1, 1980; amended Sept. 22, 2000.)

5-5-7. Waste of water. Each person shall not commit a waste of water as defined in these regulations. Upon a finding by the chief engineer that waste of water has occurred, the chief engineer may suspend use of that water right until the owner shows to the satisfaction of the chief engineer that the waste of water will no longer occur. (Authorized by K.S.A. 82a-706(a); implementing K.S.A. 82a-706; effective Dec. 3, 1990.)

5-5-8. Standards for approval of an application for a change in the place of use and a change in the use made of water. (a) Each application for a change in the place of use or the use made of water which will materially injure or adversely affect water rights or permits to appropriate water with priorities senior to the date the application for change is filed shall not be approved by the chief engineer.

(b) Each approval of a change application shall be conditioned by the chief engineer with the terms, conditions and limitations the chief engineer deems necessary to protect the public interest and enforce the terms of K.A.R. 5-5-3.

(c) As used in K.A.R. 5-5-3, "consumptive use" means gross diversions minus:

(1) waste of water, as defined in K.A.R. 5-1-1(cc); and

(2) return flows to the source of water supply:

(A) through surface water runoff which is not waste; and

(B) by deep percolation.

(d) The maximum annual quantity and maximum rate of diversion of water authorized by an approval of an application for a change in the use made of water shall not exceed the maximum annual quantity or maximum rate of diversion perfected at the time the application for change in the use made of water is filed with the chief engineer. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1993 Supp. 82a-708b; effective Nov. 28 1994).

5-5-9. Criteria for the approval of an application for a change in the use made of water from irrigation to any other type of beneficial use of water. (a) The approval of a change

in the use made of water from irrigation to any other type of beneficial use shall not be approved if it will cause the net consumptive use from the local source of water supply to be greater than the net consumptive use from the same local source of water supply by the original irrigation use based on the following criteria:

(1) The maximum annual quantity of water to be allowed by the change approval shall be the net irrigation requirement (NIR) for the 50% chance rainfall for the county of origin, as set forth in K.A.R. 5-5-12, multiplied by the maximum acreage legally irrigated under the authority of the water right in any one calendar year during the perfection period. For vested rights, the acreage used shall be the maximum acreage irrigated prior to June 28, 1945; or

(2) if the applicant establishes to the satisfaction of the chief engineer the need for more flexibility in the authorized annual quantity, the application may be approved subject to the following limits.

(A) The maximum annual quantity of water to be allowed by the change approval shall be the NIR for the 80% chance rainfall for the county of origin, as set forth in K.A.R. 5-5-12, multiplied by the maximum acreage legally irrigated in any one calendar year during the perfection period. For vested rights the acreage used shall be the maximum acreage irrigated prior to June 28, 1945.

(B) The new type of beneficial use shall be further limited by a five year fixed allocation of water in which the NIR for a 50% chance rainfall for the county of origin, as set forth in K.A.R. 5-5-12, is multiplied by five times the maximum acreage lawfully irrigated in any one calendar year during the perfection period. For vested rights, the acreage used shall be the maximum acreage irrigated prior to June 28, 1945.

(C) An application for a term permit which will circumvent the five year allocation of water limit shall not be approved by the chief engineer.

(3) In determining whether the net consumptive use of water will be increased by the proposed change in the use made of water, the applicant shall be given credit by the chief engineer for any return flows from the proposed type of beneficial use which will return to the same local source of supply as the return flows from the originally authorized type of beneficial use as substantiated by the applicant to the satisfaction of the chief engineer by an engineering report or similar type of hydrologic analysis.

(4) The authorized quantity to be changed to the new type of beneficial use shall never exceed the maximum annual quantity authorized by the water right.

(5) If a water right which overlaps the authorized place of use of one or more other water rights, either in whole or in part, is being changed to a different type of beneficial use, the total net consumptive use of all water rights after the change is approved shall not exceed the total net consumptive use of all of the rights before the change is approved.

(6) The approval for a change in the use made of water shall also be limited by that quantity reasonable for the use proposed by the change in the use made of water.

(b) Upon request of the applicant, the historic net consumptive use actually made during the perfection period, or prior to June 28, 1945 in the case of vested rights, under the water right proposed to be changed shall be considered by the chief engineer, but the burden shall be on the owner to document that historic net consumptive use with an engineering study, or an equivalent documentation and analysis, and demonstrate to the satisfaction of the chief engineer that the analysis submitted by the applicant is a more accurate estimate of the historic net consumptive use than the net consumptive use calculated using the methodology set forth in paragraph (a)(1).

(c) If the methods set forth in subsection (a) produce an authorized annual quantity of water which appears to be unrealistic and could result in impairment of other water rights, the chief engineer shall make a site-specific net consumptive use analysis to determine the quantity of water which was actually beneficially consumed under the water right. The quantity approved shall be limited to the quantity determined to be reasonable by the chief engineer's analysis. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1993 Supp. 82a-708b; effective Nov. 28, 1994.)

5-5-10. Partial changes in the use made of water from irrigation to another type of beneficial use. (a) In a case where an irrigation right is to be divided and only a portion of the rate and quantity will be changed to a different use made of water, only that portion of the annual quantity of the water right being changed to a different type of beneficial use shall be reduced as necessary to prevent the net consumptive use from increasing substantially.

(b) The authorized place of use for the irrigation right shall generally be reduced in proportion to the reduction in annual quantity caused by the change. If the irrigator desires to retain more than his or her proportional allotment of acres after the change, the procedures outlined in K.A.R. 5-5-11(b)(2)(B)(ii) shall be followed to determine whether the irrigator shall be allowed to retain more acreage.

(c) The authorized rate of diversion shall be divided between the irrigation and the non-irrigation use. Any reasonable division of the rate by the parties shall be approved. The division of the maximum rate of diversion need not be proportional to the division of the quantity as long as the division of the rate of diversion is reasonable to divert each portion of the annual quantity of water after the division of the water right is made.

(d) The division of the annual quantity shall be made as follows:

(1) Step one.

(A) Multiply the net irrigation requirement (NIR) for the 50% chance rainfall for the county of origin, as set forth in K.A.R. 5-5-12, times the maximum number or acres irrigated in any one calendar year during the perfection period. For vested rights, the acreage used shall be the maximum acreage irrigated prior to June 28, 1945.

(B) This will result in the maximum quantity that could be changed to another type of beneficial use if the entire right were changed pursuant to K.A.R. 5-5-9(a)(1).

(2) Step two.

(A) Divide the annual quantity desired to be changed to the new use by the maximum quantity that could be changed if the entire right were changed.

(B) This will result in the percentage of the entire reduced right that will be changed to the new use. The remaining percentage of the current right can be retained by the irrigation water right owner.

(3) Step three.

(A) Multiply the remaining percentage times the total currently authorized quantity. This shall be the annual quantity of water which may be retained by the irrigation water right owner. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1993 Supp. 82a-708b; effective Nov. 28, 1994.)

5-5-11. Applications for change in place of use for irrigation purposes. (a) For the purpose of this regulation, "base acreage" means:

(1) the maximum number of acres actually legally irrigated in any one calendar year on or before December 31, 1994 if the perfection period expired on or before December 31, 1994 or the water right is a vested right; or

(2) if the perfection period expires after December 31, 1994, and the perfection period has not expired at the time the change application has been filed, the base acreage shall be the number of acres authorized by the permit; or

(3) if the perfection period expires after December 31, 1994, and the perfection period has expired at the time the change application was filed, the base acreage shall be the maximum acreage legally irrigated in any one calendar year during the perfection period.

(4) Any year in which any of the terms, conditions and limitations of the water right or permit were violated shall not be used to determine base acreage.

(b) An application to change the authorized place of use for irrigation purposes which would permit the applicant to exceed the base acreage by 10 acres or 10 percent, whichever is less, shall not be approved by the chief engineer because it would result in a substantial increase in net consumptive use in violation of K.A.R. 5-5-3 except when one of the six following criteria are met.

(1) Identical places of use.

(A) The change application shall be filed only for the purpose of creating an identical place of use with another water right or rights;

(B) there shall not be a net increase in authorized acres;

(C) each water right involved in the proposed identical overlap in place of use shall be certified by the chief engineer prior to processing the change application if approval of the change application would authorize an increase in base acreage; and

(D) the total quantity authorized by all existing water rights and all permits involved shall be reasonable to irrigate the land authorized after the change in place of use is approved.

(2) Necessity to install more efficient irrigation system; limited acres and quantity.

(A) The change applicant shall submit information demonstrating to the satisfaction of the chief engineer that it is necessary to increase the base acreage so that a significantly more efficient irrigation delivery system may be installed. Types of crops to be grown or tillage practices used shall

not be considered in deciding whether the proposed system is more efficient.

(B) If the chief engineer approves the application for a change in place of use pursuant to this subsection, the following limitations shall apply.

(i) The authorized quantity of water under the water right shall be limited to a 5 year fixed allocation, computed by dividing the net irrigation requirement (NIR), as set forth in K.A.R. 5-5-12, for the 50% chance rainfall for the county where the place of use is located, by an efficiency factor of 0.85, multiplying by the base acreage as determined in subsection (a) of this regulation, and then multiplying by 5. In any given year, the water right owner shall still be authorized to divert the maximum annual quantity authorized, provided that the 5 year allocation is not exceeded.

(ii) The maximum number of irrigated acres that shall be allowed under the proposed change in place of use shall be computed by multiplying the currently authorized annual quantity by 0.85 and dividing by the NIR, as set forth in K.A.R. 5-5-12, for the 80% chance rainfall for the county where the place of use is located.

(iii) The approval of the change shall be conditioned so that the use of water in excess of the five year allocation shall result in a two year suspension of all water use under that water right and a subsequent restriction of the authorized place of use to the base acreage at a location specifically set forth in the change approval.

(3) Necessity to install a more efficient irrigation system; limited quantity.

(A) The groundwater management district in which the point of diversion is located shall agree to assume monitoring responsibility to ensure compliance with the conditions of the change approval;

(B) the applicant shall submit information demonstrating to the satisfaction of the chief engineer that it is necessary to increase the base acreage so that a significantly more efficient irrigation delivery system may be installed;

(C) the applicant shall submit a feasible operation plan demonstrating to the satisfaction of the chief engineer that the amount of water available for appropriation under that water right is reasonable to irrigate the number of acres requested to be irrigated; and

(D) the water right owner shall have no recent pattern of water use significantly in excess of the maximum annual quantity of water authorized.

(E) If the chief engineer approves the application for a change in place of use pursuant to this subsection, the following limitations shall apply.

(i) The authorized quantity of water under the water right shall be limited to a 5-year fixed allocation, computed by dividing the net irrigation requirement (NIR), as set forth in K.A.R. 5-5-12, for the 50% chance rainfall for the county where the place of use is located by an efficiency factor of 0.85, multiplying by the base acreage irrigated as determined in subsection (a) of this regulation, and then multiplying by 5. In any given year, the water right owner shall still be authorized to divert the maximum annual quantity authorized, provided that the 5-year allocation is not exceeded.

(ii) The approval of the change shall be conditioned so that the use of water in excess of the five-year allocation shall result in a two-year suspension of all water use under that water right and a subsequent restriction of the authorized place of use to the base acreage at a location specifically set forth in the change approval.

(4) Rotation of the irrigated land within the authorized place of use.

(A) The point of diversion is located outside a groundwater management district or the groundwater management district in which the point of diversion is located shall agree to assume monitoring responsibility to ensure compliance with the conditions of the change approval;

(B) the water right owner shall have no recent pattern of water use significantly in excess of the maximum annual quantity of water authorized; and

(C) approval of the change application shall result in a net increase in the number of acres authorized for irrigation purposes solely for the purpose of rotation of the irrigated land within the authorized place of use.

(D) If the chief engineer approves the application for a change in place of use pursuant to this subsection, the following limitations shall apply.

(i) Approval of the change application shall be limited by the chief engineer so that the net acres physically irrigated in any one calendar year after the change approval shall not exceed the base acreage; and

(ii) the approval shall be conditioned so that the use of water on more than the maximum number of acres authorized to be irrigated in any one calendar year shall result in a two-year suspension of all water use under that water right and a subsequent restriction of the authorized place of use

to the base acreage at a location specifically set forth in the change approval.

(5) Specific groundwater management district regulation.

The application shall meet the criteria in a regulation adopted by the chief engineer pursuant to K.S.A. 82a-1028(o) and K.S.A. 82a-706a specifically for changes in place of use for irrigation purposes for the groundwater management district in which the point of diversion is located.

(6) No increase in historic net consumptive use.

The applicant shall demonstrate to the satisfaction of the chief engineer, with an engineering report or similar type of hydrologic analysis, that the historic net consumptive use will not be increased substantially if the proposed change in place of use is approved.

(c) If the chief engineer determines that the application cannot be approved as filed, the applicant shall be notified in writing by the chief engineer prior to denial that the change application requirements have not been met and the reason for the proposed denial.

(1) In this written notice the chief engineer shall allow the applicant 15 days to request time in which to submit additional information to show why the application should be approved.

(2) Upon written request, the applicant shall be given a reasonable time specified by the chief engineer to submit an engineering report or similar type of hydrologic analysis to show that approval of the change application will not substantially increase the historic net consumptive use.

(3) The applicant shall have the burden of demonstrating to the satisfaction of the chief engineer that approval of the change application will not cause the historic net consumptive use to be increased substantially.

(d) Whether or not the time to perfect the water right has expired, including any authorized extensions of time, the application for a change in place of use to change the size of the authorized place of use for irrigation purposes may be approved without the certificate of appropriation being issued except as provided in subsection (b)(1)(C) of this regulation.

(1) If a certificate of appropriation has not been issued, the increase in base acreage shall be determined based on reliable information.

(2) The types of acceptable information shall include, but not be limited to, field inspection reports or U.S. department of agriculture records.

(e) A flow meter meeting the specifications adopted by the chief engineer, and installed and maintained in a manner satisfactory to the chief engineer, shall be required by the chief engineer in all cases where there is an increase in the base acreage authorized to be irrigated by the approval of the change in the place of use, except when:

(1) the application for change in place of use is filed solely to create an identical place of use with other water rights; and

(2) the total quantity authorized by all existing water rights and all permits to appropriate water that are involved equals or exceeds the NIR, as set forth in K.A.R. 5-5-12, in that county for a 50% chance rainfall divided by an irrigation efficiency of 0.85. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1993 Supp. 82a-708b; effective Nov. 28, 1994.)

5-5-12. Net irrigation requirements (NIR). The following amounts shall be used as the net irrigation requirements (NIR).

County	50% Chance Rainfall	80% Chance Rainfall

(Authorized by K.S.A. 82a-706a; implementing K.S.A. 1993 Supp. 82a-708b; effective Nov. 28, 1994.)

5-5-13. Relocation of alluvial wells. If an authorized point of diversion is a well that has as its source of supply an alluvium in a reach of a basin that is fully appropriated or closed to new appropriations, the approval of a change in point of diversion, and any subsequent approvals of changes in points of diversion, shall not authorize the distance between the well and the centerline of the stream to be decreased by more than 10 percent since the time the source of supply became fully appropriated or was closed to new appropriations. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-708b; effective Sept. 22, 2000.)

5-5-14. Duties of owners of approvals of applications and water rights. (a) All of the owners of an approval of application or a water right shall be responsible for taking all legally required actions necessary to maintain the validity of the approval of application or water right, including the filing of statutorily required fees, reports, and applications.

(b) (1) Unless the approval of application or the water right has been severed from the authorized place of use, except as set forth in paragraph (b) (2), all of the owners of the authorized place of use shall be considered to be the owners of the approval of application or the water right.

(2) Unless the chief engineer has documentation to the contrary, an approval of application or water right for municipal use shall be considered to be owned by the entity owning and operating the water distribution system. A water right for an

irrigation district shall be considered to be owned by the irrigation district. (Authorized by and implementing K.S.A. 82a-706a; effective Sept. 22, 2000.)

5-5-16. Additional wells. (a) An application for approval to change the point of diversion to add an additional point of diversion to divert groundwater, by either constructing a new well or moving a portion of a water right to a well that has previously been authorized by the chief engineer, shall not be approved unless it meets the following requirements:

(1) The provisions of K.S.A. 82a-708b, and amendments thereto, and any applicable regulations adopted by the chief engineer shall be met.

(2) The total maximum quantity of water authorized to be diverted each calendar year by the original well or wells, and the additional well or wells, shall not exceed any of the following limits:

(A) The maximum annual quantity of water that has been perfected;

(B) the maximum annual quantity of water authorized to be diverted before approval of the change; or

(C) the maximum consumptive use during the perfection period as required by K.A.R. 5-5-3 and as specified in either paragraph (a) (2) (C) (i) or (ii):

(i) If the water right authorizes the use of water for irrigation use, the consumptive use shall be presumed to not be increased in violation of K.A.R. 5-5-3 if the maximum annual quantity requested does not exceed the quantity in acre-feet calculated by use of the following formula: multiply the maximum number of acres legally irrigated in any one year during the perfection period by the 80 percent chance net irrigation requirements (N.I.R.), as set forth in K.A.R. 5-5-12 expressed in acre-feet, and divide that number by a delivery efficiency of 0.85.

(ii) If the beneficial use authorized is not irrigation, the net consumptive use during the perfection period shall be determined using the best information available.

(3) The total maximum rate of diversion that may be authorized for the original well or wells and the additional well or wells shall not be greater than the total maximum rate of diversion that could have been diverted from the original well or wells if they were currently being replaced by new wells at substantially the originally authorized location or locations in the same local source of supply. A reasonable value for the maximum rate of diversion shall be one of the following:

(A) The total rate of diversion based on a current water flow rate test done on the point or points of diversion; or

(B) a value based on a valid hydraulic analysis submitted by the applicant showing the current capacity of the aquifer to yield water at the currently authorized point or points of diversion.

(4) A condition shall be placed on the approval of the application for change authorizing the additional well or wells that provides that, for the sole purpose of administering wells concerning direct impairment, the additional well or wells shall be considered to have the priority of the date the application was filed to add the additional well or wells.

(b) The applicant shall submit the following information:

(1) A well completion log of the currently authorized well or a stratigraphic log of a test hole located within 300 feet of the currently authorized well;

(2) the depth of the currently authorized well;

(3) the current depth to the static water level of the currently authorized well;

(4) a stratigraphic log of a test hole located within 300 feet of the proposed location of each of the proposed additional well or wells; and

(5) any additional information that the chief engineer needs to understand the nature of the proposed additional well or wells.

(c) The proposed additional well or wells shall meet one of the following conditions:

(1) Meet the well spacing requirements to all other wells with a priority earlier than the date the change application was filed; or

(2) if a hydraulic analysis shows that the approval of the proposed additional well within 300 feet of the currently authorized well location will neither impair any water rights senior to the date the application for change was filed nor prejudicially and unreasonably affect the public interest, be located within a 300-foot radius of one of the wells, or the geocenter if the currently authorized point of diversion is a battery of wells, authorized pursuant to the water right upon which the change application has been filed.

(d) Each point of diversion authorized by an approval of an application for change for an additional well shall have a specific assignment of a

maximum instantaneous rate of diversion and a maximum annual quantity of water.

(e) Each well authorized by a water right that has been changed under the provisions of this regulation shall be equipped with a separate water flowmeter that meets or exceeds the specifications for water flowmeters adopted by the chief engineer.

(f) Each approval of an additional well or wells shall have a condition that reserves jurisdiction for the chief engineer to review the approval of the additional well or wells at intervals of no fewer than five years, and not more than 10 years, to determine if the total annual quantity of water actually being withdrawn by all wells authorized by the approval of an application for change is exceeding the total annual quantity of water that could have been physically withdrawn if the additional well or wells had not been approved. If the chief engineer determines during the review that the total annual quantity being withdrawn by all the wells, including the additional wells, exceeds the total annual quantity of water that could have been physically withdrawn by the original well or wells, the total maximum annual quantity that can be withdrawn by all the wells shall be reduced by the chief engineer to the total maximum annual quantity that could have been physically withdrawn by the original well or wells. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-708b; effective Sept. 22, 2000; amended Oct. 24, 2003.)

Article 6.—STORAGE OF WATER

5-6-1. Application proposing storage, contents. Any person intending to store water may make application to the chief engineer in the same manner as any other person making application for permit to appropriate water for beneficial use. The application shall set forth the same general information as any other application for permit to appropriate water for beneficial use and, in addition, shall be accompanied by information to show:

(a) The area-capacity data of the reservoir in which the water is to be stored.

(b) The drainage area.

(c) The names and mailing addresses of the owners of lands that will be inundated by water accumulated in the reservoir.

(d) Any additional information as may be required by the chief engineer for a proper understanding of the proposed appropriation and storage of water. (Authorized by K.S.A. 82a-706a; modified, L. 1978, ch. 460, May 1, 1978.)

5-6-2. Storage of water in watershed district reservoirs. When a person makes application for permit to appropriate water for beneficial use proposing the storage of water in a watershed district reservoir, the application shall be accompanied by one of the following:

(a) A copy of an agreement or letter from the board of directors of the watershed district that states it was mutually agreed and understood at the time an easement was granted by the landowner that the landowner was to have the use of space in the sediment pool to store the water to which he or she might be entitled under the water appropriation act.

(b) A copy of a resolution by the board of directors that shows, as of a certain date, the board allocated or gave to the landowner all or a specified part of the sediment pool for the storage of water in accordance with the water appropriation act. (Authorized by K.S.A. 82a-706a; modified, L. 1978, ch. 460, May 1, 1978.)

5-6-3. Potential net evaporation. (a) The Kansas department of agriculture, division of water resources' map titled "potential net evaporation, in inches, for Kansas," dated September 6, 1996, is hereby adopted by reference for the purpose of determining potential net evaporation from a free water surface.

(b) The values on the map shall be used in all situations in which determination of potential net evaporation from a free water surface is necessary, including the following:

(1) Calculating the maximum annual quantity of water allowed to be appropriated for the storage of surface water in a reservoir;

(2) computing the annual amount of evaporation that will be caused by exposing the groundwater table;

(3) calculating the quantity of evaporation from surface water or exposed groundwater that will be used to determine annual water use; and

(4) determining the maximum annual quantity of water that is perfected pursuant to K.S.A. 82a-714 and amendments thereto.

(c) The values shown on the map shall be used unless the applicant provides, or the chief engineer has available, better or more site-specific data concerning potential net evaporation. (Authorized by K.S.A. 82a-706a; implementing K.S.A.

82a-707(e), K.S.A. 1999 Supp. 82a-711, and K.S.A. 1999 Supp. 82a-714; effective Sept. 22, 2000.)

5-6-4. Determination of potential annual runoff. (a) Unless the applicant for an approval of application supplies, or the chief engineer has available, better or more site-specific data, the potential annual runoff shall be determined using the following:

(1) A 20 percent chance of occurrence of runoff by extrapolating from the "annual yield of runoff" graph of the United States department of agriculture, natural resources conservation service, national engineering handbook series, part 650, engineering field handbook, EFM notice KS-38, dated December 12, 1991, which is adopted by reference;

(2) the soil cover complex number of the drainage basin, using the "generalized soil cover complex number" map of Kansas produced by the Kansas department of agriculture, division of water resources, dated August 1999, which is hereby adopted by reference;

(3) the normal annual precipitation in the watershed as set forth in K.A.R. 5-6-12; and

(4) the area of the watershed of the reservoir determined by using a United States geological survey 7½-minute topographic map.

(b) In computing the potential annual runoff of the watershed of the reservoir, if the quantity of water applied for, or authorized by, prior upstream surface water and groundwater applications, approvals of applications, and existing water rights within the watershed of the reservoir will significantly decrease the potential annual runoff available for appropriation in the reservoir, the impact of those rights on the potential annual runoff shall be subtracted from the total computed potential annual runoff in order to determine the potential annual runoff available. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-707(e) and K.S.A 1999 Supp. 82a-711; effective Sept. 22, 2000.)

5-6-5. Maximum reasonable annual quantity for storage of water for beneficial use in a reservoir. The maximum reasonable annual quantity of water that may be authorized for appropriation by the chief engineer for diversion and storage in a reservoir shall be limited to the maximum of either of the following:

(a) The potential annual runoff; or

(b) the total of the following:

(1) A three-year supply of water to be rediverted for all authorized beneficial uses; and

(2) a three-year supply of water for indirect use subject to the following limitations:

(A) A maximum of three years of indirect use shall be authorized for each reservoir as a whole; and

(B) If the maximum annual quantity of water requested for rediversion exceeds the reservoir capacity, the maximum annual quantity of water authorized to be diverted and stored in any one year shall not exceed the total of the following:

(i) The annual quantity of water rediverted for beneficial use;

(ii) the reservoir capacity; and

(iii) one year of indirect use from the reservoir. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-707(e), K.S.A. 1999 Supp. 82a-711, and K.S.A. 82a-712; effective Sept. 22, 2000.)

5-6-6. Initial filling and refilling of a reservoir. (a) The initial filling of a reservoir that has a capacity that exceeds the maximum annual quantity of water authorized shall be authorized by a special condition on the approval of application.

(b) Each refilling of a reservoir after the release of water for maintenance or similar reasons shall be required to be authorized by a term permit if the reservoir capacity exceeds the maximum annual quantity authorized. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-707(e), K.S.A. 1999 Supp. 82a-711, and K.S.A. 82a-712; effective Sept. 22, 2000.)

5-6-7. Determination of average annual potential net evaporation loss. The average annual potential net evaporation loss shall be determined by multiplying the surface area of the reservoir at the top of the reservoir capacity times the value for average annual potential net evaporation, as set forth in K.A.R. 5-6-3, for the township in which the point of diversion is located. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-707(e), K.S.A. 1999 Supp. 82a-711, and K.S.A. 82a-712; effective Sept. 22, 2000.)

5-6-8. Determination of average annual seepage loss from a reservoir. Average annual seepage loss from a reservoir shall be determined by the chief engineer based on relevant, credible information furnished by the applicant. If no relevant, credible information is supplied by the applicant, it shall be assumed by the chief engineer

that there is no seepage loss. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-707(e), K.S.A. 1999 Supp. 82a-711, and K.S.A. 82a-712; effective Sept. 22, 2000.)

5-6-9. Administration of surface water stored in a reservoir. Water lawfully stored within any reservoir authorized to store water for subsequent beneficial use shall not be subject to administration unless senior water right holders downstream of the reservoir make an appropriate request to have water bypassed to satisfy their senior water right within two weeks of the runoff event, or any other time frame in which inflow to the reservoir could reasonably have been expected to be available to the downstream senior water right if the reservoir had not impounded the water. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706b; effective Sept. 22, 2000.)

5-6-10. Authorized place of use for stored surface water. The approval of application shall limit the authorized place of use to the actual location where the water will be put to beneficial use. If the authorized use is for recreational use within the reservoir only, the authorized place of use shall not exceed the size and location of the surface area of the reservoir at the elevation of the top of the principal spillway. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-711 and K.S.A. 82a-712; effective Sept. 22, 2000.)

5-6-11. Reasonable rate of diversion for storage of surface water in a reservoir. Each approval of application shall limit the rate of diversion for storage of surface water in a reservoir to all natural flows not necessary to satisfy all of the following:

(a) Senior water rights;

(b) senior approvals of applications;

(c) senior water reservation rights; and

(d) senior minimum desirable stream flows pertaining to the use of water from the same source of water supply. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-712; effective Sept. 22, 2000.)

5-6-12. Average annual precipitation. (a) The Kansas department of agriculture, division of water resources' map titled "normal annual precipitation, by township, 1961-1990," dated September 29, 1999, is hereby adopted by reference for the purpose of determining average annual precipitation.

(b) The data on the map shall be used in all situations in which the determination of average annual precipitation is necessary, including calculating the maximum annual quantity of water allowed to be appropriated for the storage of surface water in a reservoir.

(c) The values shown on the map shall be used unless the applicant provides, or the chief engineer has available, better or more site-specific data concerning average annual precipitation. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-711; effective Sept. 22, 2000.)

5-6-13. Water level measurement tube specifications. (a) The Kansas department of agriculture, division of water resources' document titled "specifications for water level measurement tube," dated November 5, 1999, is hereby adopted by reference.

(b) If a water level measurement tube is required by the chief engineer to be installed, the required water level measurement tube shall be installed in accordance with the specifications for water level measurement tubes adopted by the chief engineer. These requirements are in addition to those made by the Kansas department of health and environment pursuant to the groundwater exploration and protection act, K.S.A. 82a-1201 et seq., and amendments thereto.

(c) As long as the well is permitted, the water level measurement tube shall be maintained in a satisfactory condition. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706c; effective Sept. 22, 2000.)

5-6-13a. Check valve specifications. The Kansas department of agriculture, division of water resources' document titled "check valve specifications," dated March 14, 2003, is hereby adopted by reference. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706, K.S.A. 82a-706a, and K.S.A. 82a-712; effective Oct. 24, 2003.)

5-6-14. Irrigation with effluent from a confined feeding facility lagoon. An individual who irrigates with effluent pumped from a confined feeding facility lagoon or runoff retention pit shall not be required to have an approval of application pursuant to K.S.A. 82a-701 et seq. and amendments thereto, unless there are more than 15 acre-feet of average annual runoff meeting the following criteria:

(1) Is generated from outside of the confined feeding facility;

(2) is impounded in the lagoon or runoff retention pit; and

(3) is used for irrigation purposes. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-705 and 82a-707(a); effective Sept. 22, 2000.)

5-6-15. Drainage basin boundaries. (a) The following electronic data files, all dated February 14, 2002, prepared by the division of water resources, Kansas department of agriculture, using data developed by the United States geological survey and the natural resource conservation service, are hereby adopted by reference by the chief engineer for the purpose of defining the boundaries of the 62 drainage basins in Kansas:

(1) dwrbasins.dbf;

(2) dwrbasins.sbn;

(3) dwrbasins.sbx;

(4) dwrbasins.shp; and

(5) dwrbasins.shx.

(b) The electronic data files described in subsection (a) shall be used in all situations in which determination of the basin boundaries is necessary.

(c) The boundaries shown in the electronic data files shall be used unless the applicant provides, or the chief engineer has available, better or more site-specific data concerning the actual drainage basin boundaries. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706 and K.S.A. 82a-706a; effective Sept. 22, 2000; amended Oct. 24, 2003.)

Article 7.—ABANDONMENT AND TERMINATION

5-7-1. Due and sufficient cause for nonuse. (a) Each of the following circumstances shall be considered "due and sufficient cause," as used in K.S.A. 82a-718, and amendments thereto:

(1) Adequate moisture is provided by natural precipitation for production of crops normally requiring full or partial irrigation within the region of the state in which the place of use is located.

(2) A right has been established or is in the process of being perfected for use of water from one or more preferred sources in which a supply is available currently but is likely to be depleted during periods of drought.

(3) Water is not available from the source of water supply for the authorized use at times needed.

(4) Water use is temporarily discontinued by the owner for a definite period of time to permit soil, moisture, and water conservation, as documented by any of the following:

(A) Furnishing to the chief engineer a copy of a contract showing that land that has been lawfully irrigated with a water right that has not been abandoned is enrolled in a multiyear federal or state conservation program that has been approved by the chief engineer;

(B) enrolling the water right in the water right conservation program in accordance with K.A.R. 5-7-4; or

(C) any other method acceptable to the chief engineer that can be adequately documented by the owner before the nonuse takes place.

(5) Management and conservation practices are being applied that require the use of less water than authorized. If a conservation plan has been required by the chief engineer, the management and conservation practices used shall be consistent with the conservation plan approved by the chief engineer to qualify under this subsection.

(6) The chief engineer has previously approved the placement of the point of diversion in a standby status in accordance with K.A.R. 5-1-2.

(7) Physical problems exist with the point of diversion, distribution system, place of use, or the operator. This circumstance shall constitute due and sufficient cause only for a period of time reasonable to correct the problem.

(8) Conditions exist beyond the control of the owner that prevent access to the authorized place of use or point of diversion, as long as the owner is taking reasonable affirmative action to gain access.

(9) An alternate source of water supply was not needed and was not used because the primary source of supply was adequate to supply the needs of the water right owner. The owner shall maintain the diversion works on the alternate source of supply in a condition that will allow the owner to effectively use the alternate source of supply in a timely manner.

(10) The chief engineer determines that a manifest injustice would result if the water right were deemed abandoned under the circumstances of the case.

(b) In order to constitute due and sufficient cause for nonuse of water, the reason purporting to constitute due and sufficient cause shall have in fact prevented, or made unnecessary, the authorized beneficial use of water.

(c) Each year of nonuse for which the chief engineer finds that due and sufficient cause exists shall be considered to interrupt the successive years of nonuse for which due and sufficient cause does not exist.

(d) When a verified report of the chief engineer, or the chief engineer's authorized representative, is made a matter of record at a hearing held pursuant to K.S.A. 82a-718, and amendments thereto, that establishes nonuse of a water right for five or more successive years, the water right owner shall have the burden of showing that there have not been five or more successive years of nonuse without due and sufficient cause. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-718; modified, L. 1978, ch. 460, May 1, 1978; amended May 1, 1986; amended May 31, 1994; amended Oct. 24, 2003.)

5-7-2. Waiver of hearing. The owner of a water right may waive any hearing on the questions of abandonment and termination of such right by letter to the chief engineer requesting that it be terminated and its priority forfeited. In the event of such waiver the chief engineer shall cause the termination and forfeiture of priority date to be made a matter of record in his office and shall notify the owner of the water right of his or her action by regular mail. (Authorized by K.S.A. 82a-706a; modified, L. 1978, ch. 460, May 1, 1978.)

5-7-3. (Authorized by K.S.A. 82a-706a; modified, L. 1978, ch. 460, May 1, 1978; revoked May 31, 1994.)

5-7-4. Water rights conservation program. (a) Enrollment in the water rights conservation program (WRCP) approved by the chief engineer, and continued compliance with the WRCP shall constitute due and sufficient cause for nonuse pursuant to K.S.A. 82a-718, and amendments thereto, and K.A.R. 5-7-1 during the time the water right is enrolled in the WRCP.

(b) In order to qualify for enrollment in the WRCP, the following conditions shall be met:

(1) The point of diversion shall be located in either of the following locations:

(A) In an area that is closed to new appropriations of water, except for temporary permits, term permits, and domestic use; or

(B) in some other area designated by the chief engineer as an area where it would be in the public interest to allow water rights to be placed in the WRCP. In areas within the boundaries of a groundwater management district, the recommendations of the board of the district shall be taken into consideration by the chief engineer.

(2) Each of the owners of the water right shall agree to totally suspend all water use authorized by that water right for the duration of the contract.

(3) The owner or owners of the water right shall sign a contract with the chief engineer, or the chief engineer's authorized representative, before placing the water right into the WRCP. The contract shall be binding on all successors in interest to the water right owner.

(4) Only an entire water right may be placed into the WRCP. If a portion of a water right has been abandoned, the portion that is still in good standing may be enrolled in the WRCP. If a water right is administratively divided by the chief engineer, each portion of a formally divided water right shall be considered to be an entire water right for the purpose of this regulation.

(A) If at least five successive years of nonuse have occurred before application for enrollment in the WRCP, a determination of whether or not that water right is subject to abandonment before entry into the program, including an analysis of any reasons given that might constitute due and sufficient cause for nonuse, shall be made by the chief engineer.

(B) If, after review of the information, it appears that the right has been abandoned, the statutory procedures, including the right to a hearing, shall be followed to determine whether or not it has been abandoned.

(5) Only the portion of a water right in good standing at the time of application for enrollment may be entered into the WRCP.

(c) Other obligations, responsibilities, and aspects of enrollment in the WRCP program shall include the following:

(1) Water rights shall originally be placed into the WRCP for a definite period of calendar years of no fewer than five and no more than ten. The owner of the water right may apply for renewal of the contract for a period not to exceed 10 years. Applications for renewal shall be subject to the approval of the chief engineer. In determining whether or not to approve the renewal, the following factors shall be taken into account by the chief engineer:

(A) The hydrologic conditions in the vicinity of the point of diversion;

(B) the effect of renewal on the public interest; and

(C) any other relevant information.

(2) The water right owner or operator shall not be required to maintain the diversion works or delivery system during the period of the WRCP contract. If the pump is removed from a well, the well shall be properly capped or sealed during the contract. These requirements are in addition to those made by the Kansas department of health and environment pursuant to the groundwater exploration and protection act, K.S.A. 82a-1201 et seq., and amendments thereto.

(3) A certificate determining the extent to which a water right has been perfected shall be issued by the chief engineer before entering the water right into the WRCP if all of the following conditions are met:

(A) An applicant has a permit to appropriate water for beneficial use and has perfected all, or any portion, of the water right authorized by the permit.

(B) The time in which to perfect the water right has expired, including any authorized extensions of time.

(C) A field inspection has been completed.

(4) If the time to perfect the water right, or any authorized extension of it, has not expired, enrollment in the WRCP shall be considered as suspending the time to perfect. Upon expiration of the WRCP contract pertaining to this water right, the time to perfect shall again commence, and the applicant shall be required to perfect the water right within the remainder of the time allowed to perfect, or any authorized extension of that time.

(5) Each year after authorized enrollment in the WRCP, the water use correspondent shall indicate on the water use report that no water was used because the water right was enrolled in the WRCP.

(6) If the owner breaches, or causes or allows a breach of, the WRCP contract with the chief engineer, each year of nonuse between the effective date of the contract and the date of the breach shall be counted as years of non use without due and sufficient cause for the purpose of determining whether or not the water right has been abandoned pursuant to the provisions of K.S.A. 82a-718, and amendments thereto. Before this penalty is imposed, the owner shall be given an opportunity to show either of the following:

(A) A breach of contract did not occur.

(B) A breach occurred, but either was minor or has been cured, and should not constitute grounds for imposing the penalty. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706, K.S.A. 82a-713, K.S.A. 1999 Supp. 82a-714, and K.S.A. 1999 Supp. 82a-718; effective July 1, 1994; amended Sept. 22, 2000.)

5-7-4a. Conservation reserve program. (a) Enrollment of all, or part of, the authorized place of use in the conservation reserve program (CRP) shall not be considered good cause to extend the time to construct the diversion works.

(b) If an authorized place of use has been placed into the CRP after the diversion works have been completed but before the time to perfect the water right has expired, the appropriator may request and receive an extension of time to perfect the water right for the length of time that the authorized place of use is enrolled in the CRP program, plus the length of time remaining to perfect the water right, if all of the following conditions are met:

(1) The diversion works were properly completed within the time allowed by the approval of application.

(2) The time to perfect the water right as set forth in the approval of the application has not expired at the time the request for the extension is filed.

(3) The appropriator furnishes the chief engineer with a copy of the CRP contract, including the aerial photograph designating which land has been placed into the CRP program. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-713 and K.S.A. 1999 Supp. 82a-714; effective Sept. 22, 2000.)

5-7-5. Reduction of an existing water right. (a) In order to have an approval of application or water right reduced, the water right owner may file, at any time, a request to reduce any of the following:

(1) The authorized maximum annual quantity of water;

(2) the authorized maximum rate of diversion;

(3) the authorized place of use;

(4) the authorized points of diversion;

(5) the types of beneficial use; or

(6) any combination of paragraphs (a)(1) through (a)(5).

(b) The request to reduce a water right shall be filed on a form prescribed by the chief engineer.

(c) The request to reduce shall be submitted in

proper form and shall include the following information:

(1) Except as set forth in subsection (d) below, notarized signatures of all water right owners that would be required by K.A.R. 5-5-1 to sign an application for change under K.S.A. 82a-708b and amendments thereto;

(2) a clear description of which portion or portions of the approval of application or water right are proposed to remain;

(3) a statement that all of the owners of the approval of application or water right are waiving any right they might have to a hearing concerning the dismissal or abandonment of any portion of the approval of application or water right that they are requesting to have removed; and

(4) any other information requested by the chief engineer.

(d) A request solely to reduce the authorized place of use that will not affect the approval of application or water right in any other way shall be only required to be signed only by all of the owners of the authorized place of use that is proposed to be deleted.

(e) A reasonable request to reduce an approval of application or water right that is submitted in proper form shall be approved by the chief engineer unless it will cause the impairment of existing water rights or prejudicially and unreasonably affect the public interest. If the request to reduce the water right or approval of application is to remove a point of diversion, the approval shall reduce only that maximum annual quantity of water and maximum rate of diversion associated with the authorized point of diversion that is removed.

(f) A request to reduce an existing water right shall not be considered to be an application for a change pursuant to K.S.A. 82a-708b and amendments thereto, so no application fee shall be required. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706 and 82a-721; effective Sept. 22, 2000.)

Article 8.—CERTIFICATION OF WATER RIGHTS

5-8-1. Certification of a water right. Prior to the issuance of a certificate of appropriation by the chief engineer pursuant to an application under which water has been applied to the land of more than one owner, these landowners shall be allowed an opportunity to submit to the chief engineer an agreement signed by all landowners involved recommending how the water right should be divided among them. (Authorized by K.S.A. 82a-706a, 82a-714; effective May 1, 1980.)

5-8-2. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-712, 82a-714; effective May 1, 1980; revoked May 1, 1981.)

5-8-3. Perfection; multiple water rights. (a) The total maximum annual quantity of water that can be perfected by all water rights authorized to divert water to the same authorized place of use, shall be limited to the maximum quantity of water actually physically and legally diverted and applied to beneficial use on the common authorized place of use during any one calendar year during the perfection period for the water right being certified.

(b) The junior water right shall be limited by means of a limitation clause in the certificate so that the authorized annual quantity of water for the junior water right, when combined with all senior water rights authorized to apply water to beneficial use on the common authorized place of use, does not exceed either of the following standards:

(1) The annual quantity of water reasonable for the type of beneficial use made of the water; and

(2) the total annual quantity of water legally diverted by all water rights to the common authorized place of use during any one calendar year during the perfection period of the junior water right.

(c) The limitation clause on the junior water right being certified shall not restrict the total annual quantity authorized to be diverted to the authorized place of use to less than the total annual quantity of water authorized by the senior water right or water rights for beneficial use on the common authorized place of use.

(d) The owner whose water right is being certified shall be sent a draft certificate showing the maximum rate of diversion and maximum annual quantity of water that are being proposed for the certificate. The water right owner shall be given a reasonable time period of no fewer than 30 days to comment on the draft certificate and to provide any additional information concerning the water diverted and applied to beneficial use on the authorized place of use during the perfection period in accordance with the terms, conditions, and limitations of the approval of application, and all other water rights and approvals of applications

authorized to divert water to the common authorized place of use.

(e) In certifying a water right with a priority date before the effective date of this regulation, the provisions of subsection (a) shall be followed to the extent possible. If sufficient information is not available to make the determination described in subsection (a), the best information available shall be utilized by the chief engineer to determine the quantity of water applied to the authorized place of use during any one calendar year during the perfection period under the authority of the approval of application being certified and all other water rights. The standard set forth in paragraph (b)(1) shall be applied, even if sufficient information is not available to make the determination described in subsection (a). (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-707(e), K.S.A. 82a-713, and K.S.A. 1999 Supp. 82a-714(a); effective Sept. 22, 2000.)

5-8-4. Construction of diversion works. (a) A reasonable period of time for construction of diversion works shall be not less than one full year following the approval of the application to appropriate water. If a person demonstrates that a reasonable long-term schedule for development of diversion works or other infrastructure is in the public interest, that information shall be taken into consideration by the chief engineer in determining a reasonable period of time for the construction of diversion works.

(b) For good cause shown by the applicant, a reasonable extension of time to construct the diversion works shall be allowed by the chief engineer, if the request for extension is filed pursuant to the requirements of K.A.R. 5-3-7 and is accompanied by the statutorily required filing fee.

(c) If the total time allowed to construct the diversion works has been more than 16 months and fewer than 24 months, an extension of time shall be granted by the chief engineer only if the applicant meets the following criteria:

(1) Demonstrates good cause;

(2) provides a copy of a contract with the well driller or other information substantiating the intent to proceed to complete the construction of the diversion works in an expeditious manner;

(3) files the request for extension pursuant to the requirements of K.A.R. 5-3-7; and

(4) submits the statutorily required filing fee.

(d) If the total time allowed to construct the diversion works equals or exceeds 24 months, an extension of time may be granted only if the applicant demonstrates to the chief engineer that circumstances beyond the control of the applicant necessitate the extension of time.

(e)(1) The applicant shall file a notice of completion of diversion works and the statutorily required field inspection fee with the chief engineer no later than March 1 following the deadline to construct the diversion works. The notice of completion of diversion works shall be filed on a form prescribed by the chief engineer.

(2) If a water flowmeter has been required by the chief engineer as a condition of the permit, the applicant shall also file a notice of completion of installation of a water flowmeter on a form prescribed by the chief engineer. This form shall be due at the same time that the notice of completion of diversion works form is due.

(f)(1) The applicant shall be sent a notice by the chief engineer giving the applicant 30 days to show that the diversion works were completed within the time allowed in accordance with the terms, conditions, and limitations of the approval of application and to pay the field inspection fee, if it has not already been paid, under either of the following conditions:

(A) A notice of completion of diversion works has not been completely and timely filed with the chief engineer.

(B) Information on file in the office of the chief engineer indicates that the diversion works were not properly constructed within the time allowed to construct the diversion works, including any authorized extensions of time.

(2) The permit shall be dismissed and its priority forfeited if the applicant fails to perform the following:

(A) To demonstrate that the diversion works were completed within the time allowed by the approval of application; and

(B) to pay the statutorily required field inspection fee, if it has not already been paid. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-712, K.S.A. 82a-713, and K.S.A. 1999 Supp. 82a-714; effective Sept. 22, 2000.)

5-8-6. Perfection of a water right. (a) Except for municipal use, a reasonable period of time to perfect a water right shall be no fewer than four full calendar years following the deadline for construction of the diversion works. If the time to construct the diversion works is extended, the perfection period shall be extended to no fewer than

four full calendar years beyond the final deadline to construct the diversion works, unless the owner of the approval of application objects.

(b) A reasonable time to perfect a water right for municipal use shall be no fewer than 20 full calendar years plus the remainder of the calendar year in which the application was approved. Each holder of a permit for municipal use of water shall submit a progress report to the chief engineer 10 full calendar years after the permit was issued. The report shall be submitted on a form prescribed by the chief engineer. The report shall meet the following conditions:

(1) Compare the annual water use projected in the original application with the actual annual water use for the prior 10 years; and

(2) document compliance with an approved conservation plan, if one had been required. If the 10-year review by the chief engineer shows that actual annual water use is significantly less than originally projected, the holder shall revise the estimated annual water use for the next 10 years. If it is in the public interest, the total authorized annual quantity of water for the next 10 years shall be reduced by the chief engineer to a reasonable annual quantity based on the municipal user's revised estimates of annual water use for the next 10 years. If the 10-year review indicates that a required conservation plan was not being complied with or that the conservation plan does not meet the Kansas water office's conservation guidelines for municipal users, as in effect at the time of the review, an order requiring any of the following shall be issued by the chief engineer:

(A) That the conservation plan be amended to comply with current guidelines;

(B) that the user comply with the provisions of the approved conservation plan; or

(C) both of the requirements in paragraphs (b) (2) (A) and (B).

(c) If the applicant demonstrates to the chief engineer that a longer perfection period is necessary to justify purchase or construction of infrastructure related to the diversion, treatment, or distribution of water that actually is being built, the original time to perfect a water right for municipal use or other public entity, including a utility, may be extended for a period not to exceed a total time to perfect of 40 years.

(d) For good cause shown by the applicant, a reasonable extension of time to perfect a water right shall be allowed by the chief engineer if the request for extension is filed pursuant to the terms of K.A.R. 5-3-7 and is accompanied by the statutorily required filing fee.

(e) If water use reports and other information on file in the office of the chief engineer indicate that no water was applied to the authorized beneficial use during the time allowed to perfect the water right, including any authorized extensions of time, the owner of the approval of application as shown in the records of the chief engineer shall be sent a notice by the chief engineer, giving the owner 30 days to show that water was put to beneficial use within the terms, conditions, and limitations of the permit during the perfection period. If the owner fails to demonstrate that water was so used, the permit shall be dismissed and its priority forfeited. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-707(e), K.S.A. 82a-712, K.S.A. 82a-713, and K.S.A. 1999 Supp. 82a-714; effective Sept. 22, 2000.)

5-8-7. Extensions of time to perfect a water right. (a) For all beneficial uses of water, except municipal use, the total time to perfect the water right, including extensions of time, shall not exceed 10 years after the calendar year in which the diversion works were required to be completed unless one or more of the following "extenuating circumstances" exist.

(b) "Extenuating circumstances" shall include the following:

(1) Circumstances beyond the control of the owner of the approval of application that have unduly restricted the owner's ability to perfect the water right;

(2) actions or omissions by the chief engineer that make it necessary to extend the time to perfect; and

(3) for applications with a priority before May 1, 1978, the unavailability or lack of credibility of records of water use, crops grown, and the number and location of acres actually irrigated, and other relevant information during the perfection period, but other records or information is available for a period after the perfection period and would reasonably represent the application of water to beneficial use in accordance with the terms, conditions, and limitations of the permit.

(c) The burden shall be on the owner of the approval of application to document the extenuating circumstances described in subsection (b) and justify to the chief engineer the need for the extension of time to perfect the water right.

(d)(1) Extensions of time to perfect for appli-

cations with a priority before May 1, 1978, may be granted in any reasonable increment of years. The total amount of time allowed to perfect the water right shall be reasonable.

(2) Extensions of time to perfect a water right for nonmunicipal use, with a priority on or after May 1, 1978, may be granted in any increment of time until the total time to perfect equals 10 years. After the total time allowed to perfect the water right equals 10 years, extensions of time shall be granted in one-year increments only.

(e) Extensions of the time to perfect a water right for municipal use of water that can be justified shall be extended in five-year increments or less after the original 20-year time period to perfect the water right has elapsed. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-712 and 82a-713; effective Sept. 22, 2000.)

5-8-8. Owner required to allow chief engineer to conduct timely field inspection for certification. (a) In order to allow the chief engineer to conduct a timely field inspection to certify a water right, the owner of an approval of application shall perform the following:

(1) Operate the diversion works in the same manner that they were operated when water was applied to beneficial use during the perfection period, so that an accurate rate-of-diversion test can be conducted by the chief engineer;

(2) allow the chief engineer access to the diversion works and the authorized place of use for the purpose of making the field inspection; and

(3) allow, cooperate with, and assist the chief engineer in any other ways necessary for the chief engineer to conduct the field inspection.

(b) The owner of the approval of application shall allow the field inspection to be conducted within 365 days after the chief engineer has sent the owner of the approval of application a restricted letter requesting that the chief engineer be allowed to conduct a field inspection. If the owner does not cooperate with, assist, and allow the chief engineer to conduct a field inspection, without good cause, within one year after the restricted letter is sent by the chief engineer, an order shall be issued by the chief engineer requiring the owner of the approval of application to comply with the terms of the restricted letter. The order shall also be sent by restricted mail. If the owner fails to comply with the order of the chief engineer, an action shall be brought by the chief engineer to enforce the order of the chief engineer pursuant to the act for judicial review, and civil enforcement of agency actions, K.S.A. 77-624 et seq. and amendments thereto. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-714; effective Sept. 22, 2000.)

Article 9.—TEMPORARY PERMITS

5-9-1. Application for temporary permit acceptable for filing. To be acceptable for filing, an application for temporary permit to appropriate water for beneficial use shall meet the following requirements: (a) Be made on the form prescribed by the chief engineer;

(b) be signed by the applicant or an authorized representative of the applicant;

(c) be accompanied by the statutory application fee;

(d) contain all the information requested for the proposed use as set forth in the prescribed application form; and

(e) include any other information requested by the chief engineer that is necessary to understand the application. (Authorized by and implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-727; effective May 1, 1979; amended Oct. 24, 2003.)

5-9-2. Priority. Upon receipt in the office of the chief engineer of an acceptable application for temporary permit to appropriate water, accompanied by the statutory application fee, a stamp showing the date and time of receipt shall be placed on the application form. The date and time of receipt of the application shall establish the priority to the use of the water. The priority shall terminate on the date when use of water will be discontinued as set forth in the application or any authorized extension of time thereof. (Authorized by K.S.A. 82a-727; effective May 1, 1979.)

5-9-3. Quantity. A temporary permit shall not be granted for a quantity in excess of 1,000,000 gallons except for dewatering purposes or when water is to be diverted from a source located on a construction site and used on the construction site in connection with a project that the chief engineer has approved under the authority of K.S.A. 82a-301 through 305a or K.S.A. 24-126. (Authorized by K.S.A. 82a-727b; implementing K.S.A. 82a-727; effective May 1, 1979; amended Dec. 3, 1990.)

5-9-4. Place of use limitation. A temporary permit shall not be granted for more than one

place of use. (Authorized by K.S.A. 82a-727; effective May 1, 1979.)

5-9-5. Point of diversion limitation. A temporary permit shall not be granted authorizing more than one point of diversion from any source of supply. (Authorized by K.S.A. 82a-727; effective May 1, 1979.)

5-9-6. Approval of application. The approval of an application for a temporary permit shall be by endorsement on the application by the chief engineer. The endorsement shall set forth the terms, limitations, and conditions necessary for the protection of the public interest. (Authorized by and implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-727; effective May 1, 1979; amended Oct. 24, 2003.)

5-9-7. Extension of time. For good cause shown by the applicant the chief engineer may grant an extension of time to continue the use of water under a temporary permit beyond the date authorized as shown in the approval of the application. The term of a temporary permit shall not exceed six (6) months including any authorized extension of time thereof. (Authorized by K.S.A. 82a-727; effective May 1, 1979.)

5-9-8. Ownership. A temporary permit for the appropriation of water shall not be transferable. (Authorized by K.S.A. 82a-727; effective May 1, 1979.)

5-9-9. Reserved.

5-9-10. Application fee for a temporary permit. The fee for an application for a temporary permit or extension of a temporary permit shall be twenty-five dollars ($25.00). This regulation shall be effective on and after September 1, 1982. (Authorized by and implementing K.S.A. 1982 Supp. 82a-727; effective, T-83-25, Sep. 1, 1982; effective May 1, 1983.)

5-9-11. Documentation of access to source of water supply for temporary permit. Before approval of a temporary permit, the applicant shall show that permission for access to the source of water supply has been obtained from the landowner or landowners of the property where the proposed point of diversion will be located. If permission is granted in an oil and gas lease, it shall be sufficient for the applicant to indicate this on the application for a temporary permit to appropriate water. If the water is to be obtained from land not covered by the oil and gas lease, then the permission of the landowner or landowners shall be adequately documented. (Authorized by and implementing K.S.A. 82a-727; effective Sept. 22, 2000.)

Article 10.—WATER APPROPRIATION

5-10-1. (Authorized by K.S.A. 82a-706a, K.S.A. 1982 Supp. 82a-708a; implementing K.S.A. 1982 Supp. 82a-708a; effective, T-83-25, Sep. 1, 1982; effective May 1, 1983; revoked May 1, 1988.)

5-10-2. (Authorized by K.S.A. 82a-706a, K.S.A. 1982 Supp. 82a-708a; implementing K.S.A. 1982 Supp. 82a-708a; effective, T-83-25, Sep. 1, 1982; effective May 1, 1983; revoked May 1, 1988.)

5-10-3. (Authorized by K.S.A. 82a-706a, K.S.A. 1982 Supp. 82a-708b; implementing K.S.A. 1982 Supp. 82a-708b; effective, T-83-25, Sep. 1, 1982; effective May 1, 1983; revoked May 1, 1988.)

5-10-4. Waiver or exemptions. The chief engineer may grant an exemption or waiver from any regulation adopted by the chief engineer if it is shown that the granting of such exemption or waiver will not prejudicially nor unreasonably affect the public interest and that it will not impair an existing water right. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-711, 82a-712; effective May 1, 1983.)

5-10-5. Administration of water use among vested right holders. If, during the administration of water rights, each appropriation right and approved permit to appropriate water for beneficial use has been regulated in accordance with the provisions of K.S.A. 82a-706b, the division of water resources shall administer the water available from that source of supply among the holders who have active vested rights, including vested rights for domestic purposes, on a proportional basis and in a manner which will provide, if possible, sufficient flow in the stream for vested rights for domestic purposes. The proportionment may be accomplished by a pro rata reduction in the rate or quantity that each vested right shall be allowed to divert, by setting up a rotation system or by any other equitable method. Vested rights shall be administered in this manner unless they have been adjudicated by a court of

competent jurisdiction as to priority or rotation and then the chief engineer shall administer them in accordance with the order of the court. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-704a and K.S.A. 82a-706; effective May 1, 1986.)

5-10-6. Procedure for determination of an active vested domestic water right. The existence of an active domestic vested water right shall be determined by the chief engineer as follows:

(a) Information shall be filed with the chief engineer on a form prescribed by the chief engineer concerning the dates beneficial use of water was made, and the nature and extent of the active domestic vested right.

(b) Affidavits from at least three competent disinterested persons shall be filed by the claimant on a form prescribed by the chief engineer or other reliable substantiating evidence shall be submitted to the chief engineer by the claimant documenting the dates beneficial use of water was made, and the nature and extent of the active domestic vested right.

(c) Within a reasonable time, the staff of the division of water resources shall investigate the information submitted.

(d) Notice.

(1) Written notice of the claim shall be sent by the chief engineer to all water right owners of record in the office of the chief engineer with an authorized point of diversion within one-half mile of the claimed point of diversion.

(2) In addition, one notice in a newspaper with general circulation in the county in which the point of diversion is located shall be published by the chief engineer. Such published notice shall contain:

(A) the name of the claimant;

(B) the location of the claimed point of diversion; and

(C) a declaration that it is a claim for a domestic vested right.

(3) All notices shall be given at least 14 days prior to the close of the record.

(e) A copy of the chief engineer's draft order determining the active domestic vested water right and any comments received in response to the notices shall be furnished to the claimant by the chief engineer or the chief engineer's authorized representative.

(f) The claimant shall be given thirty days from the date the chief engineer mails the draft to the claimant in which to submit additional information, request a hearing concerning the determination, or both.

(g) If a hearing is requested by the claimant in a timely manner, or the chief engineer deems it to be in the public interest to do so, a hearing shall be held by the chief engineer, or the chief engineer's authorized representative, within a reasonable time.

(h) The chief engineer shall issue the order determining whether the claimed active vested domestic right exists and, if so, determining the nature and extent of that right.

(i) The order determining the active vested domestic right shall be made a matter of record in the office of the chief engineer. In addition, a copy of the order shall be furnished to the claimant by the chief engineer, with instructions that it shall be filed with the register of deeds in the county in which the point of diversion is located.

(j) All vested domestic water rights shall be assumed to have a priority of June 28, 1945 until they have been adjudicated by a court of competent jurisdiction. Vested domestic rights shall be administered in accordance with K.A.R. 5-10-5. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-705a; effective Nov. 28, 1994.)

Article 11.—ASSURANCE DISTRICTS

5-11-1. Definitions. As used in these rules and regulations and the water assurance program act by the division of water resources in the administration of the water assurance program act, unless the context clearly requires otherwise, the following words and phrases shall have the meaning ascribed to them in this section.

(a) "Board" means the board of directors of a water assurance district.

(b) "Chief engineer" means the chief engineer of the division of water resources of the Kansas state board of agriculture. (Authorized by K.S.A. 82a-1345(e); implementing K.S.A. 82a-1334; effective May 31, 1994.)

5-11-2. Determination of benefits. (a) A water assurance district member may apply in writing to the board to be removed as a member of the district if that member is no longer receiving benefits from supplementing the stream by assurance reservoir releases because:

(1) the member no longer has a water right or permit; or

(2) the member's water right or permit has been reduced so that the member is no longer receiving benefits.

(b) The board shall forward the request to be removed as a member from the district to the chief engineer, who shall determine whether the member will be receiving benefits. The chief engineer shall forward the results of that determination to the board in writing within a reasonable time.

(1) If the chief engineer determines that the member will continue to receive benefits, the chief engineer shall notify the board and the member's application to be removed shall be dismissed by the board.

(2) If the chief engineer determines that the member will no longer be receiving benefits, the chief engineer shall notify the board and it shall be determined by the board whether the member will be removed from the district and the terms of removal. (Authorized by K.S.A. 82a-1345(e); implementing K.S.A. 82a-1334; effective May 31, 1994.)

Article 12.—AQUIFER STORAGE AND RECOVERY

5-12-1. Aquifer storage and recovery permitting. (a) An operator may store water in an aquifer storage and recovery system under a permit to appropriate water for artificial recharge if the water appropriated is source water. The requirements of article 12 of the rules and regulations adopted by the Kansas department of agriculture, division of water resources are in addition to any requirements of the Kansas department of health and environment concerning underground injection wells, including article 46 of the rules and regulations adopted by the Kansas department of health and environment.

(b) Each application for a permit to appropriate water for artificial recharge shall describe the horizontal and vertical extent of the basin storage area in which the source water will be stored.

(1) The horizontal extent shall be determined by a closed boundary within which the recharge system used to store the water will be physically located. The recharge system may include recharge pits, recharge trenches, recharge wells, or other similar systems that cause source water to enter the storage volume of the basin storage area, either by gravity flow or by injection. The basin storage area may be subdivided into smaller areas representative of the areas that may be recharged by the individual recharge systems.

(2) The vertical extent shall be defined by a minimum and a maximum index water level for the basin recharge storage area, or for each subdivided area within the basin storage area if the basin storage area is subdivided. The minimum index water level shall be the lowest water level within the basin storage area, or smaller subdivided area if the basin storage area is subdivided, that occurred within the 10 years before the filing of the application for a permit to appropriate water, or a period of time longer than 10 years demonstrated by the applicant to reflect the lowest water level. If the basin storage area is subdivided, measurements from the same year shall be used to determine the minimum index water level for each subdivision. The maximum index water level shall represent the maximum storage potential for the basin storage area.

(c) An application for a permit to appropriate water for artificial recharge shall set forth the maximum annual quantity and maximum rate of diversion of source water.

(d) (1) Each application for a permit to appropriate water for artificial recharge shall include a methodology for accounting for water stored in a basin storage area both on an annual basis and on a cumulative basis so that recharge credits can be calculated. If more than one application for a permit to appropriate water for artificial recharge relates to the same aquifer storage and recovery system, each application shall use the same methodology for accounting for water stored in the basin storage area. The accounting of the water balance of all water entering and leaving the basin storage area shall be determined by using sound engineering methods based on actual measurements, generally accepted engineering methodology, or a combination of both.

(2) Approval of any application for a permit to appropriate water for artificial recharge shall be contingent upon the chief engineer's approval of the method for accounting for the basin storage area.

(e) An applicant for recovery of water stored by the holder of a permit to appropriate water for artificial recharge to store water in a basin storage area shall obtain a permit separate from the aquifer storage permit to appropriate water for beneficial use for each well used to recover the water stored. The maximum annual quantity of water that may be appropriated for this purpose shall be

no more than the maximum cumulative recharge credits available to the operator of the aquifer storage and recovery system. These credits shall be determined by the accounting methodology approved under a permit to appropriate water for artificial recharge pertaining to the aquifer storage and recovery system. In determining whether diversion of the annual quantity impairs other water rights, the following data may be considered by the chief engineer:

(1) The maximum storage volume available in the basin storage area;

(2) the spatial distribution of recharge and withdrawal systems;

(3) the maximum rate of diversion at which the water will be withdrawn; and

(4) any other relevant information.

Recharge credits may be accumulated over more than one year, and any amount of recharge credits available may be withdrawn in accordance with the permit if the withdrawal does not impair other water rights.

(f) The approval of application, if the water to be diverted is the water artificially recharged into the basin storage area, shall be conditioned upon the following:

(1) Generally accepted engineering methodology;

(2) a maximum annual quantity that does not exceed the recharge credits; and

(3) an annual reporting that complies with K.A.R. 5-12-2. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-711 and K.S.A. 82a-712; effective Sept. 22, 2000.)

5-12-2. Aquifer storage and recovery accounting. (a) In addition to annual water use reporting requirements pursuant to K.S.A. 82a-732, and amendments thereto, on June 1 of each year the permit holder of an aquifer storage or recovery system shall report an accounting of water in the basin storage area to the chief engineer and to any groundwater management district identified in subsection (c) of this regulation. The annual report for the preceding calendar year shall account for all water entering and leaving the basin storage area and shall specifically compute the amount of recharge credits held in the basin storage area.

(b) The report shall be in the form prescribed by the chief engineer and shall address the items in the water balance for the basin storage area, which may include the following amounts:

(1) Natural and artificial recharge;

(2) groundwater inflow and outflow;

(3) evaporation and transpiration;

(4) groundwater water diversions from all nondomestic wells;

(5) infiltration from streams;

(6) groundwater discharge to streams;

(7) the calculated recharge credits; and

(8) any other information that in the opinion of the chief engineer is pertinent to the basin storage and surrounding areas.

The annual accounting shall specifically take into account the amounts of natural recharge, artificial recharge, groundwater inflow, groundwater outflow, evapotranspiration, and groundwater pumpage. Groundwater pumpage shall include recharge credits withdrawn as well as pumpage from all nondomestic wells in the basin storage area. The annual accounting shall include any additional items within a basin storage area that would be necessary to determine the amount of recharge credit available for recovery.

(c) If any part of the basin storage area is within the boundaries of a groundwater management district, the permit holder of any aquifer storage or recovery system shall furnish a copy of the annual report to the district board for comments by June 1 of each year.

(d) If a groundwater management district receives an annual report, the district may provide comments to the chief engineer if the comments are submitted to the chief engineer within 30 days of the district's receipt of the report identified in subsection (c) of this regulation.

(e) The permit holder may be required by the chief engineer to submit additional information pertinent to the system. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-711 and K.S.A. 82a-712; effective Sept. 22, 2000.)

5-12-3. Hearings. (a) A hearing shall be held by the chief engineer in the general vicinity where an applicant proposes aquifer storage and recovery before approval of any such application for aquifer storage and recovery.

(b) If any part of a proposed basin storage area is within the boundaries of a groundwater management district, the hearing required by subsection (a) of this regulation shall be held within the groundwater management district. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-711 and K.S.A. 82a-712; effective Sept. 22, 2000.)

5-12-4. Aquifer storage and recovery systems in a groundwater management district. A groundwater management district may recommend rules and regulations pertaining to monitoring and accounting requirements for that portion of the basin storage area that falls within the district's boundaries. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-711, K.S.A. 82a-712, and K.S.A. 82a-1028(o); effective Sept. 22, 2000.)

Article 13.—SAND AND GRAVEL PIT OPERATIONS

5-13-1. Notice of intent to open or expand a sand and gravel pit operation. Each operator desiring to open or expand a sand and gravel pit operation shall file a notice of intent to open or expand a sand and gravel pit operation on a form prescribed by the chief engineer before opening or expanding the sand and gravel pit operation.

The following information shall be included on the form:

(a) The legal description of the sand and gravel pit operation;

(b) the date the project began or will begin;

(c) the number of acres of the groundwater table that will be exposed by the project at the time active mining ceases;

(d) a legal description and a map showing the location of the groundwater that will be exposed at the time active mining ceases;

(e) the year the pit excavation is estimated to be completed;

(f) measures that will be used to protect the area groundwater supply from pollution; and

(g) any other pertinent information that may be required by the chief engineer to understand the nature of the proposed project and to ensure that the provisions of K.S.A. 82a-734, and amendments thereto, and any regulations promulgated thereunder, are being complied with. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-721 and K.S.A. 82a-734; effective Sept. 22, 2000.)

5-13-2. Determination of "substantially adverse impact on the area groundwater supply." (a) A sand and gravel operation shall be deemed to cause a "substantially adverse impact on the area groundwater supply," as provided in K.S.A. 82a-734 (b) and amendments thereto, if the sand and gravel pit operation is opened or expanded after the effective date of this regulation in any township that has an average annual potential net evaporation greater than 18 inches per year as determined from K.A.R. 5-6-3.

(b) In any township that has an average annual potential net evaporation of 18 or fewer inches per year, as determined from K.A.R. 5-6-3, the opening or expansion of a sand and gravel pit operation, shall be deemed to not cause a "substantially adverse impact on the area groundwater supply," as provided in K.S.A. 82a-734 and amendments thereto, unless the chief engineer can demonstrate that the project will cause one or more of the following:

(1) A direct impairment to a groundwater approval of application or water right;

(2) an unreasonable deterioration of the groundwater quality;

(3) an unreasonable raising or lowering of the static water level; or

(4) prevention of any waters of the state from moving to a person having a prior right to use these waters. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-721 and K.S.A. 82a-734; effective Sept. 22, 2000.)

5-13-3. Determination of when groundwater evaporation is a beneficial use. On and after the effective date of this regulation, whenever the opening or expansion of a sand and gravel operation is considered to cause a substantially adverse impact on the area groundwater supply pursuant to K.A.R. 5-13-2, the evaporation caused shall be considered to be a beneficial use, and the operator shall be required to receive an approval of application, or approval of an application for change, pursuant to K.S.A. 82a-701 et seq. and amendments thereto, before exposing the groundwater table to evaporation. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-711, K.S.A. 82a-721, and K.S.A. 82a-734; effective Sept. 22, 2000.)

5-13-4. Exemption. (a) To the extent that groundwater evaporation causes a substantially adverse impact to the area groundwater supply pursuant to K.A.R. 5-13-2, a new application to appropriate the groundwater evaporation caused by the project shall be exempt from meeting the safe yield, allowable appropriation, or similar types of regulations adopted by the chief engineer. This exemption shall be granted if the operator meets all of the criteria in subsection (b) because exempting the quantity of water that has been, or will be, evaporated by exposing the

groundwater table beneath the proven reserves will not prejudicially and unreasonably affect the public interest and will not impair any existing water right.

(b) Except as set forth in subsection (e), in order to qualify for this exemption, the operator shall show that on December 31, 1999, all of the following conditions were met:

(1) The operator had an active, existing sand and gravel mining operation.

(2) If required, the operator had a valid surface-mining license issued pursuant to the surface-mining land conservation and reclamation act, K.S.A. 49-601 et seq., and amendments thereto.

(3) If required, the operator had made a timely application for a hydraulic dredging permit or had received a hydraulic dredging permit issued pursuant to the Kansas water appropriation act.

(4) The operator had filed the water use reports required by, and paid any civil fines assessed by the chief engineer pursuant to K.S.A. 82a-732, and amendments thereto.

(5) The operator had paid the water protection fees required by K.S.A. 82a-954, and amendments thereto.

(6) To the extent necessary to physically operate, the operator had acquired all local permits and local zoning approvals.

(7) The operator had purchased, leased, or otherwise acquired legal control over proven sand and gravel reserves.

(8) The operator had filed an application to appropriate water or filed a notice of intent to open or expand a sand and gravel pit operation with the chief engineer when required by K.S.A. 82a-734(a), and amendments thereto.

(c) It shall be the burden of the operator to show that the operator meets the requirements of subsection (b) by filing the necessary information or documentation with the chief engineer on or before December 31, 2001. An extension of time may be granted by the chief engineer for good cause if the request for extension of time is filed by the operator with the chief engineer before December 31, 2001.

(d) To the extent that the operator meets the requirements of subsection (b) above, an application to appropriate water for evaporation of the groundwater caused by exposing the groundwater table shall be exempt from complying with safe yield, allowable appropriation, and similar types of regulations adopted by the chief engineer. This exemption shall apply to all the evaporation caused by exposing the groundwater table up to the areal extent of the proven reserves that existed on December 31, 1999.

(e) If, on the effective date of this regulation, an operator was in the process of establishing a replacement operation for an active, existing sand and gravel pit operation, an exemption shall be allowed by the chief engineer for the proposed replacement operation according to subsection (d) on terms, conditions and limitations that will neither cause impairment of existing water rights nor prejudicially and unreasonably affect the public interest if all of the following criteria are met:

(1) The proposed replacement sand and gravel operation is located outside the boundaries of all groundwater management districts and intensive groundwater use control areas.

(2) The geocenter of the proposed replacement operation is located within two miles of the geocenter of the existing, active operation.

(3) The proposed replacement operation met the provisions of paragraphs (b)(1) through (b)(6) of this regulation on December 31, 1999.

(4) The proposed replacement project meets the requirements of paragraphs (b) (7) and (8) on the effective date of this regulation. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-721, K.S.A. 1999 Supp. 82a-1904, and K.S.A. 82a-734; effective Sept. 22, 2000.)

5-13-5. Approval of pit operations that are opened or expanded after the effective date of this regulation. Except as set forth in K.A.R. 5-13-4, pit operations that are excavated or expanded after the effective date of this regulation and that have a substantial adverse impact on the area groundwater supply shall meet one of the following conditions:

(a) Receive prior approval of the chief engineer for a new permit to appropriate an annual quantity of water sufficient to offset the evaporation caused by exposing the groundwater table in a manner described in K.A.R. 5-13-7;

(b) acquire existing water rights and receive approval of the chief engineer to change the point of diversion, place of use, and the use made of water to authorize the water rights to be used for the project in a manner described in K.A.R. 5-13-7;

(c) acquire and take out of production sufficient water rights in the manner described in K.A.R. 5-13-7 to offset the net average annual evaporation caused by exposing the groundwater table; or

(d) any combination of the above. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-721 and K.S.A. 82a-734; effective Sept. 22, 2000.)

5-13-6. Determination of the maximum rate of diversion and annual quantity of water. The annual quantity of water, in acre-feet, required to be appropriated for evaporation caused by exposing the area groundwater table shall be determined by multiplying the exposed groundwater surface area of the project in acres by the potential net evaporation in inches, for Kansas, as found in K.A.R. 5-6-3, and dividing by 12. The rate of diversion shall be the natural rate of evaporation. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-721 and K.S.A. 82a-734; effective Sept. 22, 2000.)

5-13-7. Offsets for evaporation of groundwater. The net average annual quantity of groundwater evaporation shall be authorized, accounted for, or offset in one or more of the following ways:

(a) An approval of application or water right currently authorizes the use of water at that pit location.

(b) A new approval of application authorizes the use of water at that pit location.

(c) Acceptable quality surface water that is legally and physically available for groundwater recharge is authorized to be diverted into the proposed project.

(d) Both of the following conditions are met:

(1) Water is made available by acquiring all, or a portion of, an existing water right to any of the following:

(A) Use surface water or groundwater, or both, that is hydraulically connected to a stream channel aquifer in which the project is located;

(B) use groundwater from an unconsolidated regional aquifer that is within a two-mile radius of the geocenter of the project that is the same unconsolidated regional aquifer in which the project is located, or a hydraulically connected aquifer; or

(C) use groundwater from an unconsolidated regional aquifer that is within a 3.5 mile radius of the geocenter of the project and is the same unconsolidated regional aquifer in which the project is located, or a hydraulically connected aquifer, if the operator can demonstrate to the chief engineer that sufficient water rights to offset the evaporation caused by the project cannot be acquired within a two-mile radius of the geocenter of the project after making reasonable and prudent efforts to find both proven reserves and water rights.

(2) The applicant demonstrates to the chief engineer that the acquired water right, or portion of it, will no longer be exercised by any of the following:

(A) Placing it in the custodial care of the state;

(B) placing it in a perpetual trust approved by the chief engineer; or

(C) restricting its future use in some other way that the chief engineer determines to be adequate to ensure that it will no longer be exercised.

(e) Diffused surface water is diverted into the project from inside a berm surrounding the project built to prevent unacceptable quality surface water from entering the groundwater table. The average annual amount of runoff shall be determined from a map titled "figure 12. — mean annual runoff in Kansas," dated June 1982, published by the Kansas water office and hereby adopted by reference, unless the applicant demonstrates to the chief engineer, or the chief engineer has, better, more site-specific data.

(f) Any other water credit or offset that the chief engineer determines will adequately offset the groundwater evaporation caused by the pit operation. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-721 and K.S.A. 82a-734; effective Sept. 22, 2000.)

5-13-8. Offset calculations. All of the following requirements shall apply with respect to an offset water right described in K.A.R. 5-13-7(d): (a) No physical diversion of the offset water right shall be required or allowed.

(b) The project shall receive credit for 100 percent of the net consumptive use of the water right used as an offset.

(c) Credit for acquisition of an existing surface water right shall be given for an equivalent quantity of water that is legally and physically available within the terms, conditions, and limitations of the surface water right at the location of the groundwater pit. The quantity of water available at the groundwater pit from the acquired surface water right shall be calculated by taking into account the following:

(1) Stream gains;

(2) stream losses;

(3) transit losses;

(4) water supplied from intervening tributaries; and

(5) water needed to satisfy senior surface water rights to the same source of supply.

(d) Credit for acquisition of a groundwater right with a point of diversion located in the same stream channel aquifer as the groundwater pit shall be given for either of the following:

(1) A groundwater right located within a two-mile radius of the groundwater pit; or

(2) a groundwater right in the same source of water supply with a point of diversion located more than two miles up gradient of the geocenter of the groundwater pit for the quantity of water legally and physically available under that groundwater right at its original point of diversion, minus the transit loss between the original groundwater point of diversion and the geocenter of the proposed pit. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-721 and K.S.A. 82a-734; effective Sept. 22, 2000.)

5-13-9. Easements and covenants. The applicant shall provide any easements or covenants, attached to or running with the land, that are necessary to document that the offset water acquired pursuant to K.A.R. 5-13-7 will continue to be legally available to offset the evaporation of groundwater. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-721 and K.S.A. 82a-734; effective Sept. 22, 2000.)

5-13-10. Time to construct the diversion works for a sand and gravel pit operation. (a) As used in this regulation, "completion of diversion works" means that both of the following have occurred:

(1) All equipment necessary to begin to operate a sand and gravel operation, including the hydraulic dredge, has been installed.

(2) Sufficient overburden has been excavated to begin to expose the groundwater to evaporation.

(b) A reasonable time to construct the diversion works for a sand and gravel pit operation shall be not less than one full year following the approval of the application to appropriate water.

(c) For good cause shown by the applicant, a reasonable extension of time to construct the diversion works shall be allowed by the chief engineer if both of the following conditions are met:

(1) The request for extension is filed pursuant to the requirements of K.A.R. 5-3-7.

(2) The request for extension is accompanied by the statutorily required filing fee. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-712 and 82a-713; effective Sept. 22, 2000.)

5-13-11. Time to perfect a water right for evaporation of groundwater. (a) A reasonable time to perfect a water right for evaporation of groundwater caused by a sand and gravel pit operation shall be neither less than five calendar years plus the remainder of the calendar year in which the application was approved, nor more than 20 years plus the remainder of the calendar year in which the application was approved.

(b)(1) For good cause shown by the applicant, a reasonable extension of the time to perfect the water right shall be allowed by the chief engineer if both of the following conditions are met:

(A) The request is timely filed pursuant to the terms of K.A.R. 5-3-7.

(B) The request is accompanied by the statutorily required filing fee.

(2) The total time to perfect a water right shall not exceed 40 years. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-713; effective Sept. 22, 2000.)

Article 14.—ENFORCEMENT AND APPEALS

5-14-1. Enforcement. (a) Except as set forth in subsection (i), the procedure set forth below shall be followed whenever enforcement action is taken by the chief engineer after becoming aware that a person may be performing any of the following:

(1) Violating any provision of K.S.A. 82a-701 et seq., and amendments thereto;

(2) violating any provision of a regulation adopted pursuant to that act; or

(3) violating a term, condition, or limitation of an approval of application or water right.

(b) The alleged violation shall be investigated by the chief engineer.

(c) A written report of the investigation shall be prepared by the chief engineer. This report shall include any documents regarding the matter that were relied upon or prepared by the chief engineer. This report shall be made a part of the official record of the chief engineer. If an approval of application or a water right is involved, the report shall be made an official part of that file.

(d)(1) If the investigation shows that no violation has occurred or that enforcement action is not warranted, no further enforcement action shall be taken at that time.

(2) If the investigation determines that a violation has occurred, an order shall be issued by the

chief engineer. The owner or owners of the approval of application or water right, as shown in the records of the chief engineer, shall be served by delivering a copy in person or sending a copy of the order by restricted mail. The order shall specify the following:

(A) What the violation is;

(B) what actions are necessary to correct the violation;

(C) what a reasonable time is in order to correct the violation. Extensions of time to correct a violation may be granted by the chief engineer if good cause is shown by the violator or owner;

(D) that the order will become effective immediately; and

(E) that a hearing may be requested within 15 days of the issuance of the order. The request for a hearing may include a request for a stay of the order. If the person shows good cause why a stay should be granted, a stay may be granted by the chief engineer.

(e) If the violation is corrected within the time specified by the chief engineer, the violator shall notify the chief engineer. An inspection shall be conducted by the chief engineer to determine if the violation has been corrected. If the violation has been corrected, the diversion of water may continue within the terms, conditions, and limitations of the approval of application or water right.

(f) If the violation is not corrected within the time specified by the chief engineer, an order requiring that unauthorized or illegal diversion of water cease until the violation is corrected shall be issued by the chief engineer.

(g) If the violator ceases diversion of water and then corrects the violation, the violator shall notify the chief engineer when the violation is corrected. The diversion works and the authorized place of use, as appropriate, shall be inspected by the chief engineer to determine if the violation has been corrected. If the chief engineer determines that the violation has been corrected, the order prohibiting diversion of water shall be rescinded by the chief engineer as soon as possible. When the owner or violator receives notice from the chief engineer that the order prohibiting the diversion of water has been rescinded, the diversion of water may recommence.

(h) (1) Any of the actions listed in paragraph (h) (2) may be taken by the chief engineer if the violator performs any of the following acts and fails to cease the diversion of water as ordered by the chief engineer:

(A) Violates any provision of K.S.A. 82a-701 et seq., and amendments thereto;

(B) violates any provision of a regulation adopted pursuant to that act; or

(C) violates a term, condition, or limitation of an approval of application or a water right.

(2) If the violator performs any act listed in paragraph (h)(1), any of the following actions may be taken by the chief engineer:

(A) Bring an action to enforce the orders of the chief engineer pursuant to the act for judicial review and civil enforcement of agency actions, K.S.A. 77-624 et seq., and amendments thereto;

(B) request the attorney general to bring an action in the name of the state of Kansas;

(C) request that criminal proceedings be brought pursuant to K.S.A. 82a-728, and amendments thereto;

(D) enter into a consent order with the violator specifying the remedial actions that shall be taken by the violator;

(E) take any other legally permissible enforcement action; or

(F) any combination of the above actions.

(i) The provisions of this regulation shall not apply to any actions taken by the chief engineer pursuant to K.S.A. 82a-706b, and amendments thereto, to enforce water right priorities and to prevent direct impairment by either of the following:

(1) Junior water rights; or

(2) illegal diversions of water.

(j) After the violator has been issued an order as specified in subsection (f), the violator may request an administrative hearing before the chief engineer in accordance with the provisions of K.A.R. 5-14-2. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706, 82a-706b, 82a-706d, and 82a-728; effective Sept. 22, 2000.)

5-14-2. Request for conference hearing. (a) Each written request for a hearing of an order issued by the chief engineer according to K.A.R. 5-14-1 shall be served on the chief engineer within 15 days of the issuance of the order. The request for a hearing may include a request for a stay of the order. If the requester demonstrates good cause for a stay to the chief engineer, a stay of the order may be granted by the chief engineer.

(b) If a request for a hearing is not served on the chief engineer within 15 days after the order

is issued by the chief engineer, the order shall become a final agency action as defined by K.S.A. 77-607, and amendments thereto.

(c) If a request for a hearing is filed with the chief engineer within 15 days of the issuance of an order, a conference adjudicative hearing shall be held by the chief engineer.

(d) A conference hearing shall be an informal proceeding conducted according to the following criteria:

(1) The hearing officer shall regulate the course of a conference proceeding.

(2) Only parties may testify and present written exhibits.

(3) Only parties may offer comments on the issues.

(4) The hearing officer may conduct all or part of the hearing by telephone, or other electronic means, if each participant in the hearing has the opportunity to participate in the entire proceeding while it is taking place.

(5) The hearing shall be recorded at the agency's expense.

(6) Any party, at the party's expense and subject to any reasonable conditions that the chief engineer may establish, may cause a person other than the chief engineer to prepare a transcript from the chief engineer's recording or cause additional recordings to be made during the hearing.

(e) After the conference adjudicative hearing, or completion of a full adjudicative hearing if the conference hearing was converted to a full hearing, a final agency action, as defined by K.S.A. 77-607, and amendments thereto, shall be issued by the chief engineer. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706 and K.S.A. 82a-706b; effective Sept. 22, 2000.)

5-14-3. Administrative appeal to the secretary of agriculture. (a) Except as set forth in subsection (f), a summary order shall be issued by the chief engineer in accordance with the provisions of K.S.A. 77-537 through 77-542, and amendments thereto, for the following types of actions:

(1) Approval or rejection of an application to change the place of use, the point of diversion, the use made of water, or any combination, filed pursuant to K.S.A. 82a-708b, and amendments thereto;

(2) approval of an application as filed, approval of a smaller maximum annual quantity of water than requested, approval with conditions necessary to protect the public interest, or disapproval of an application to appropriate water for beneficial use filed pursuant to K.S.A. 82a-711, and amendments thereto; and

(3) abandonment and termination of a water right pursuant to K.S.A. 82a-718, and amendments thereto.

(b) If a request for a hearing is not filed with the chief engineer within 15 days after issuance of the summary order by the chief engineer, the order shall become final.

(c) If a request for a hearing is filed with the chief engineer within 15 days, a conference adjudicative hearing shall be held by the chief engineer in accordance with the provisions of K.S.A. 77-533 through K.S.A. 77-535, and amendments thereto.

(d) After the conference adjudicative hearing, an initial order shall be issued by the chief engineer in accordance with the provisions of K.S.A. 77-526, and amendments thereto.

(e) A petition for review of the initial order shall be filed with the secretary of agriculture in accordance with the provisions of K.S.A. 77-527, and amendments thereto, within 15 days of the issuance of the initial order by the chief engineer.

(f) A hearing may be held by the chief engineer in accordance with K.A.R. 5-3-4a before processing a new application to appropriate water if the chief engineer determines that one of the following conditions exists:

(1) It is in the public interest.

(2) A person demonstrates to the chief engineer that approval of the application may cause impairment of senior approvals of applications or water rights.

If the chief engineer holds a hearing before processing a new application to appropriate water, an initial order shall be issued by the chief engineer. A petition for review of the initial order shall be filed in accordance with the provisions of subsection (e) of this regulation. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-708b, K.S.A. 82a-709, K.S.A. 1999 Supp. 82a-711, K.S.A. 1999 Supp. 82a-718, K.S.A. 1999 Supp. 82a-1038, and K.S.A. 1999 Supp. 82a-1901; effective Sept. 22, 2000.)

5-14-4. Appeal of the failure of the chief engineer to timely issue a certificate of appropriation. (a) The time period specified in K.S.A. 82a-714(c), and amendments thereto, shall begin when the time authorized to perfect the wa-

ter right, including any authorized extensions of time, expires.

(b) If the chief engineer fails to issue a certificate of appropriation within the time limit specified by K.S.A. 82a-714(c) and amendments thereto, the water right owner may file a request for review with the secretary of agriculture pursuant to K.S.A. 82a-1901, and amendments thereto, within 15 days of the expiration of the time period specified in K.S.A. 82a-714(c) and amendments thereto. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-714 and K.S.A. 1999 Supp. 82a-1901; effective Sept. 22, 2000.)

5-14-5. Conditions of a request for a conference hearing. (a) Any request for a conference hearing before the chief engineer shall meet the following conditions:

(1) Be in writing and be served on the chief engineer within 15 days of the issuance of the summary order;

(2) clearly admit, deny, or explain each of the findings of facts and conclusions of law in the summary order;

(3) identify any facts and conclusions of law that the person disputes and intends to place at issue; and

(4) state any other defenses and the bases for those defenses.

(b) If the person states that the person has no knowledge of a particular factual allegation, that allegation shall be deemed denied in the request. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706 and K.S.A. 82a-706b; effective Sept. 22, 2000.)

5-14-6. Informal settlement. At any time during the proceedings conducted under K.A.R. 5-14-2, K.A.R. 5-14-3, or K.A.R. 5-14-4, the alleged violator may request a settlement conference. The request shall be in writing and shall be served on the chief engineer on behalf of the alleged violator. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 1999 Supp. 82a-1901; effective Sept. 22, 2000.)

5-14-7. Conversion of a conference hearing. (a) At any point during a conference hearing being conducted according to K.A.R. 5-14-2, the conference hearing may be converted by the chief engineer to a full adjudicative hearing to be heard by the chief engineer.

(b) The conversion of a conference hearing to a full adjudicative hearing may be effected only upon providing notice to all parties to the original proceedings.

(c) The record of the conference hearing may be used in the full adjudicative hearing.

(d) After a conference hearing is converted to a full adjudicative hearing, the hearing officer shall perform the following:

(1) Give any additional notice to parties or other persons necessary to satisfy the requirements of a full adjudicative hearing; and

(2) conduct any additional proceedings necessary to satisfy the requirements of a full adjudicative hearing.

(e) If the conference hearing is converted to a full adjudicative hearing, the full adjudicative hearing shall be conducted according to the following criteria:

(1) The hearing officer shall regulate the course of the proceedings.

(2) The parties may testify and present exhibits.

(3) The hearing officer may allow nonparties an opportunity to present oral or written statements and exhibits.

(4) All testimony shall be given under oath.

(5) To the extent necessary for full disclosure of all relevant facts and issues, the hearing officer shall afford to all parties the opportunity to respond, present evidence and arguments, conduct cross-examination, and submit rebuttal evidence.

(6) The hearing officer may conduct all or part of the hearing by telephone or other electronic means, if each party in the hearing has an opportunity to participate in the entire proceeding while it is taking place.

(7) The hearing shall be recorded at the agency's expense.

(8) Any party, at that party's expense and subject to any reasonable conditions that the state agency may establish, may cause a person other than the state agency to prepare a transcript from the state agency's recording or cause additional recordings to be made during the hearing. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706 and 82a-706b; effective Sept. 22, 2000.)

5-14-10. Civil penalties; suspension or modification of water rights. (a) In addition to any other authorized enforcement procedures, if the chief engineer finds that any of the violations specified in K.S.A. 82a-737, and amendments thereto, have occurred, a written order shall be issued by the chief engineer stating the following:

(1) The nature of the violation;

(2) the factual basis for the violation;

(3) the civil penalty, suspension, modification of a water right or use of water, or any combination of these, to be imposed; and

(4) the appropriate procedure for appeal pursuant to K.S.A. 82a-1901, and amendments thereto.

(b) The categories of offenses specified in subsections (c), (d), and (e) shall be applied when assessing the civil penalty for each violation. Each day on which the violation continues to occur may constitute a separate offense.

(c)(1) Each category 1 offense shall result in a civil penalty of $100.

(2) Category 1 offenses shall include the following:

(A) A threat to divert water without authorization from the chief engineer;

(B) irrigating an unauthorized place of use that is 10 acres or less;

(C) diversion of water at a rate in excess of the authorized rate of diversion, but less than 115 percent of the authorized rate of diversion;

(D) maintaining a water flowmeter or other water-measuring device required by the chief engineer that is out of compliance as specified by K.A.R. 5-1-9; and

(E) violation of any other condition on a water right or approval of application not specified anywhere else in this regulation.

(d)(1) Each category 2 offense shall result in a civil penalty of $500.

(2) Category 2 offenses shall include the following:

(A) Diverting water from an unauthorized point of diversion of water;

(B) irrigating an unauthorized place of use that is more than 10 acres;

(C) failure to properly implement a conservation plan required by the chief engineer;

(D) committing a waste of water;

(E) diversion of water at a rate that equals or exceeds 115 percent of the authorized rate of diversion;

(F) failure to install a water flowmeter or other acceptable water-measuring device;

(G) failure to promptly provide complete and accurate water use or other data, information, or records requested by the chief engineer, except the annual water use reports required by K.S.A. 82a-732, and amendments thereto;

(H) diversion of water in excess of the authorized quantity of water; and

(I) applying water to an unauthorized type of beneficial use.

(e)(1) Each category 3 offense shall result in a civil penalty of $1,000.

(2) Category 3 offenses shall include the following:

(A) Tampering with a water flowmeter or other acceptable water-measuring device;

(B) causing a water flowmeter or other acceptable water-measuring device to show an incorrect reading by any method, including any of the following:

(i) Altering the propeller;

(ii) reversing the water flowmeter; or

(iii) running the water flowmeter in reverse by any means;

(C) failing to timely install or removing a required water flowmeter or other acceptable water-measuring device;

(D) falsifying water use or other data required by the chief engineer;

(E) denying authorized personnel of the chief engineer access as required by K.S.A. 82a-706b, and amendments thereto;

(F) violating a cease and desist order issued by the chief engineer; and

(G) violating an order of the chief engineer issued pursuant to K.S.A. 82a-706b and amendments thereto.

(f) The civil penalties specified in paragraph (c)(1) may be increased if the chief engineer finds that aggravating circumstances exist. The civil penalties specified in paragraph (d)(1) may be increased or decreased if the chief engineer finds that aggravating or extenuating circumstances exist. The civil penalties specified in paragraph (e)(1) may be decreased if the chief engineer finds that extenuating circumstances exist. Extenuating circumstances and aggravating circumstances shall include the following:

(1) Prior violations;

(2) intentional noncompliance or gross negligence; and

(3) failure to correct the violation upon discovery or notification by the chief engineer.

(g) In addition to the assessment of a civil penalty or any other penalty provided for by law, any water right may be modified or suspended by the chief engineer upon the issuance of a written order finding a violation as established in subsection (a). Except as otherwise specified by regulation,

violation of either a multiyear annual allocation or a condition limiting the net acres that may be irrigated in any one calendar year pursuant to an approval to allow annual rotation of the authorized place of use for irrigation shall result in the following:

(1) A two-year suspension of all water use authorized by the water right, any term permit, and any water right upon which the multiyear allocation or rotation was based;

(2) a subsequent restriction of the authorized place of use to the base acreage at a location specifically set forth in the change approval; and

(3) after any suspension has expired, a reversion to all conditions in effect on the water right before approval of the change application authorizing the multiyear allocation or rotation.

In all other cases, the term of the suspension or modification shall be determined by the chief engineer based upon the circumstances set forth in subsection (f).

(h) Any person aggrieved by an order of the chief engineer may request a review pursuant to K.S.A. 82a-1901, and amendments thereto, and after exhaustion of administrative remedies, may appeal to the district court in the manner provided by the act for judicial review and civil enforcement of agency actions. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a, K.S.A. 2002 Supp. 82a-737, and K.S.A. 2002 Supp. 82a-1901; effective Oct. 24, 2003.)

5-14-11. Civil fines; water use reporting. (a) Each owner of a water right or approval of application who fails to perform either of the following shall be assessed a civil penalty of $250 for each water right or approval of application that is not timely filed or that is materially incomplete or inaccurate:

(1) Timely submit an annual water use report pursuant to K.S.A. 82a-732, and amendments thereto; or

(2) submit a complete and accurate water use report as required by K.S.A. 82a-732, and amendments thereto.

(b) If the owner submits both the complete and accurate water use report and payment of the civil penalty after March 1 but before June 1, the civil penalty per water right or approval of application shall be reduced to $50 for each water right or approval of application. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 82a-732; effective Oct. 24, 2003.)

Article 15.—MINIMUM DESIRABLE STREAMFLOWS

5-15-1. Administration of minimum desirable streamflow. (a) Except as specified in subsection (d), if the streamflow at a minimum desirable streamflow (MDS) gaging station falls below the streamflow established in K.S.A. 82a-703c, and amendments thereto, for a period of seven consecutive days, a determination of whether the following conditions have been met shall be made by the chief engineer:

(1) The actual daily average streamflow at the gage has been less than the streamflow trigger value set by K.A.R. 5-15-4.

(2) If an alluvial aquifer has a significant effect on streamflow, the static groundwater level in the alluvial aquifer above the gage is insufficient to maintain MDS in the stream.

(b) Whenever the chief engineer determines that MDS administration should occur according to subsection (d) or because the conditions specified in paragraphs (a)(1) and (2) have both been met, water rights and approvals of applications with a priority after April 12, 1984 shall be administered in order of priority as necessary to protect the appropriate minimum desirable streamflow specified in K.S.A. 82a-703c, and amendments thereto. Owners of record in the office of the chief engineer of water rights and approvals of applications that are being administered shall be notified by the chief engineer that water rights and approvals of applications are being administered to protect MDS. This notification shall be made by certified mail, personal notice, or other verifiable means.

(c) After administration to protect MDS has begun, no person that has received notice according to subsection (b) may divert water under the authority of a water right or approval of application with a priority after April 12, 1984, unless one of the following conditions is met:

(1) The owner of the water right or approval of application has entered into an annual MDS consent order with the chief engineer in accordance with the provisions of K.A.R. 5-15-2 and is diverting water in accordance with the terms of that MDS consent order.

(2) The chief engineer has determined, in accordance with the provisions of K.A.R. 5-15-3, that administration of water rights and approvals of applications with a priority after April 12, 1984 is no longer necessary to protect MDS and has notified the owners by certified mail, personal notice, or other verifiable means that diversions may continue in accordance with the terms, conditions, and limitations of the water right or approval of application.

(d) If the streamflow at an MDS gaging station falls below the level established in K.S.A. 82a-703c, and amendments thereto, for a period of seven consecutive days and no streamflow trigger value has been set for an MDS gaging station in K.A.R. 5-15-4, a determination of whether and when MDS administration will begin and how it should occur shall be made by the chief engineer, based on the following factors:

(1) The general hydrologic conditions affecting streamflow in the stream reach;

(2) the magnitude and duration of recent streamflows;

(3) the extent to which groundwater contributes to streamflow;

(4) the effects of drought on streamflow;

(5) the existence and effect of relevant water management agreements;

(6) the magnitude of the effect that the administration of water rights with priorities junior to the MDS values would have on the streamflow; and

(7) the effect of reservoir operations.

This regulation shall be effective on and after August 27, 2002. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-703a, 82a-703b, and 82a-703c; effective, T-5-4-29-02, April 29, 2002; effective Aug. 27, 2002.)

5-15-2. Minimum desirable streamflow consent orders. (a) An annual minimum desirable streamflow (MDS) consent order according to K.A.R. 5-15-1(c)(1) may be entered into by the chief engineer and the owner of the water right or approval of application to divert surface water. This consent order shall contain the following provisions:

(1) Whenever the chief engineer has determined that the administration of water rights and approvals of applications to divert surface water with a priority after April 12, 1984 is necessary to protect the minimum desirable streamflow set by K.S.A. 82a-703c, and amendments thereto, water shall not be diverted under the authority of these water rights or approval of applications unless the owner has been notified by the chief engineer by certified mail, personal notice, or other verifiable means that either of the following conditions has been met:

(A)(i) The chief engineer has determined that the average daily streamflow has been, or is likely to be, at or above the temporary surface water diversion threshold for a period of time specified in K.A.R. 5-15-4 or set by the chief engineer according to K.A.R. 5-15-1(d); and

(ii) the chief engineer has determined that water is available to be diverted during that time period under the priority of water rights or approval of applications with a priority after April 12, 1984 without impairing senior water rights or senior water reservation rights.

(B) The chief engineer has determined that it is no longer necessary to administer water rights and approval of applications to protect the minimum desirable streamflow set by K.S.A. 82a-703c, and amendments thereto.

(2) The owner of the water right or approval of application shall properly install and maintain a water flowmeter on all points of diversion authorized by the water rights or approval of applications in accordance with regulations adopted by the chief engineer.

(3) The water right owner agrees that failure to abide by either of the following will result in the suspension of the water right or approval of application pursuant to K.S.A. 82a-737, and amendments thereto, for the remainder of the calendar year, and any other enforcement actions that may be authorized by law:

(A) The terms of the MDS consent order; or

(B) the terms, conditions, and limitations of the water right or approval of application.

(4) The water right owner agrees to comply with any other provisions that the chief engineer determines are necessary to prevent impairment, protect MDS values, and protect the public interest.

(b) If the chief engineer determines that hydrologic conditions indicate that some groundwater will be available to be pumped in the basin during the next water-use season or year by water rights or approval of applications with a priority after April 12, 1984, the owner of the water right or approval of application may enter into an an-

nual MDS consent order pursuant to K.A.R. 5-15-1(c)(1) to divert groundwater, upon approval of the chief engineer. This consent order shall contain the following provisions:

(1) Whenever the chief engineer has determined that the administration of water rights and approval of applications to divert groundwater with a priority after April 12, 1984 is necessary to protect minimum desirable streamflows set by K.S.A. 82a-703c, and amendments thereto, groundwater shall not be diverted under the authority of the water right or approval of application unless the owner has been notified by the chief engineer by certified mail, personal notice, or other verifiable means that one of the following conditions has been met:

(A) During MDS administration during that calendar year, the owner is authorized to divert, pursuant to the owner's water right or approval of application, a quantity of water not to exceed that quantity of water set forth in K.A.R. 5-15-4 as the well pumping allowance.

(B) The chief engineer has determined that it is no longer necessary to administer water rights and approvals of applications to protect the minimum desirable streamflows set by K.S.A. 82a-703c, and amendments thereto.

(2) The owner of the water right or approval of application shall properly install and maintain a water flowmeter on all points of diversion authorized by the water right or approval of application in accordance with regulations adopted by the chief engineer.

(3) The total quantity of water authorized to be diverted under the water right or approval of application during a calendar year shall not exceed the annual quantity of water authorized.

(4) The water right owner agrees that failure to abide by either of the following will result in the suspension of the water right or approval of application for the remainder of the calendar year, and any other enforcement actions that may be authorized by law:

(A) The terms of the MDS consent order; or

(B) the terms, conditions, and limitations of the water right or approval of application.

(5) The water right owner agrees to comply with any other provisions that the chief engineer determines are necessary to prevent impairment, protect MDS values, and protect the public interest.

This regulation shall be effective on and after August 27, 2002. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-703a, 82a-703b, and 82a-703c, and K.S.A. 2001 Supp. 82a-737; effective, T-5-4-29-02, April 29, 2002; effective Aug. 27, 2002.)

5-15-3. Cessation of minimum desirable streamflow administration. (a) Except as specified in subsection (c), whenever the chief engineer determines that both of the conditions specified in subsection (b) have been met, the administration of water rights and approvals of applications with a priority after April 12, 1984 to protect minimum desirable streamflows pursuant to K.S.A. 82a-703c, and amendments thereto, shall be declared by the chief engineer to be no longer necessary. The owners of those water rights and approvals of applications shall be notified by the chief engineer by certified mail, personal notice, or other verifiable means that the owners may recommence diverting water in accordance with the terms, conditions, and limitations of their water rights or approvals of applications.

(b)(1) The streamflows at the minimum desirable streamflow (MDS) gage have exceeded the streamflows established by K.S.A. 82a-703c, and amendments thereto, for a period of 14 consecutive days.

(2) If a significant alluvial aquifer exists, the average static water level in the alluvial aquifer has recovered sufficiently to maintain MDS in the stream.

(c) Whenever the chief engineer determines that hydrologic conditions indicate that MDS values have been met or exceeded and are likely to be maintained for the foreseeable future, MDS administration may be declared by the chief engineer to be no longer necessary even if both of the conditions of subsection (b) have not been met.

This regulation shall be effective on and after August 27, 2002. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-703a, 82a-703b, and 82a-703c; effective, T-5-4-29-02, April 29, 2002; effective Aug. 27, 2002.)

5-15-4. Standards for minimum desirable streamflow. The streamflow trigger values, temporary surface water diversion thresholds, and well pumping allowances set forth in the following table shall be used whenever appropriate in these regulations.

MDS gaging station	streamflow trigger value	temporary surface water diversion threshold	well pumping allowance
Republican River Concordia	150 percent of the daily average MDS value* for the 60 preceding days	115 percent of MDS value* for a period of at least five days	32 percent of the maximum annual quantity of water that has not been diverted under the authority of that water right or approval of application, at the time MDS administration begins
Republican River Clay Center	150 percent of the daily average MDS value* for the 60 preceding days	100 percent of MDS value* for a period of at least five days	32 percent of the maximum annual quantity of water that has not been diverted under the authority of that water right or approval of application, at the time MDS administration begins

* "MDS value" means the minimum desirable streamflow value established by K.S.A. 82a-703c, and amendments thereto.

This regulation shall be effective on and after August 27, 2002. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-703a, 82a-703b, and 82a-703c; effective, T-5-4-29-02, April 29, 2002; effective Aug. 27, 2002.)

Article 16.—FLEX ACCOUNT

5-16-1. Definitions. As used in this article of regulations, in the Kansas water appropriation act, and by the chief engineer in the administration of the Kansas water appropriation act, unless the context clearly requires otherwise, the following words and phrases shall have the meanings ascribed to them in this regulation. (a) "Base amount" and "BA" mean the quantity of water deposited in a flex account.

(b) "Base average usage factor" and "BAUF" mean the percentage of the "base average usage," as this term is defined in K.S.A. 82a-736 and amendments thereto, that is multiplied by five as a part of the calculations set out by K.A.R. 5-16-5 to determine the quantity of water that may be deposited into a flex account. The BAUF shall not exceed the maximum of 90% established by K.S.A. 82a-736 and amendments thereto.

(c) "Base water right" means a vested or certified water right or rights for which the owner applies to the chief engineer to establish a flex account pursuant to K.S.A. 82a-736, and amendments thereto.

(d) "BAU" means the "base average usage" as defined in K.S.A. 82a-736, and amendments thereto.

(e) "Good standing," only as that term is used in K.S.A. 82a-736, and amendments thereto, in reference to base water rights, means a base water right that meets the following conditions:

(1) Has been lawfully exercised within the 11-year time period specified in K.A.R. 5-16-5;

(2) has had all required water use reports filed and any civil fines assessed for failure to timely file a complete and accurate water use report paid; and

(3) has had no period of nonuse with a duration of five or more consecutive years since January 1, 1990, except for enrollment in the water right conservation program according to K.A.R. 5-7-4, enrollment in the federal conservation reserve program, or enrollment in another multiyear federal or state conservation program.

(f) "Significant water conservation measures" means actual physical changes in a water distribution system or management practices that improve water use efficiency, including the following:

(1) Conversion from flood irrigation to center pivot irrigation with a nozzle package designed to improve water use efficiency;

(2) irrigation scheduling;

(3) conversion to subsurface drip irrigation; and

(4) removal of an end gun, resulting in a significant reduction in the number of irrigated acres. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 2004 Supp. 82a-736, as amended by L. 2005, ch. 142, sec. 3; effective Oct. 11, 2002; amended Jan. 6, 2006.)

5-16-2. Fee to establish flex account and apply for term permit. The filing fee for establishing a flex account and applying for a five-year term permit to exercise the flex account shall be $400. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 2001 Supp. 82a-708a(d), as amended by L. 2002, Ch. 181, § 21; effective Oct. 11, 2002.)

5-16-3. Establishing a flex account. (a) A flex account shall be established by filing an application for a flex account and a term permit on a form prescribed by the chief engineer. The five-year period shall begin on January 1 of the next calendar year for which the application has been timely filed, unless expressly authorized by the chief engineer to begin the following January 1. The application shall also show the location of all wells located within one-half mile of the proposed point of diversion, and the names, addresses, and telephone numbers of the owners of those wells. Except as set forth in subsection (e), a separate application shall be filed for each water right and each point of diversion for which the owner desires to establish a flex account. Each application shall be accompanied by the filing fee specified in K.A.R. 5-16-2.

(b) Before any application to establish a flex account and a term permit will be accepted for filing, the application shall be signed by at least one owner of the water right, or a duly authorized agent of an owner of the water right.

(c) Before the flex account can be established or the term permit approved, all of the water rights owners, or a duly authorized agent of the owners, shall verify upon oath or affirmation that the statements contained in the application are true and complete.

(d) If one or more owners refuse to sign the application or if a written request is filed by one or more of the owners to withdraw their signatures from the application before the application is approved, the application shall be dismissed.

(e) A single application to establish a flex account and apply for a term permit may be filed in the following situations:

(1) Multiple water rights authorize the diversion of water from a single point of diversion that diverts water to an identical place of use for a single type of use.

(2) Multiple points of diversion are authorized by the chief engineer to divert water through a single water flowmeter before going to an identical place of use.

(f) The flex account shall not be established, and the term permit to exercise the flex account shall not be valid until both have been approved by the chief engineer. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 2001 Supp. 82a-736; effective Oct. 11, 2002.)

5-16-4. Conditions on the term permit. (a) The place of use authorized by a term permit shall be identical to the place or places of use authorized by the base water right or rights.

(b) The type of use authorized by a term permit shall be limited to one of the types of use authorized by the base water right or rights.

(c) The rate of diversion authorized by a term permit shall not exceed the maximum instantaneous rate of diversion authorized by the base water right or rights. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 2001 Supp. 82a-736; effective Oct. 11, 2002.)

5-16-5. Maximum annual quantity of water authorized by term permit. (a) Except as set forth in subsections (b) through (e), the maximum quantity of water deposited in a flex account and authorized to be diverted in five consecutive calendar years under the authority of a term permit shall be determined in accordance with K.S.A. 82a-736, and amendments thereto, by means of these calculations:

(1) Adding the total actual, legal annual water use of the base water right or rights for the period of calendar years 1992 through 2002;

(2) dividing that total quantity of water by 11;

(3) multiplying that quantity by the BAUF; and

(4) multiplying that quantity by five.

(b) If significant water conservation measures were implemented under the base water rights at any time during the period of calendar years 1992 through 2002, the average annual quantity of water actually used may be calculated using the five consecutive calendar years immediately preceding the implementation of significant water conservation measures, but these five calendar years shall not begin before calendar year 1987. The five-year allocation under the term permit shall be determined by means of these calculations:

(1) Adding the total actual, legal annual water use of the base water right or rights for the five consecutive calendar years;

(2) dividing that total quantity of water by five;

(3) multiplying that quantity by the BAUF; and

(4) multiplying that quantity by five.

(c) If water use records for a base water right are inadequate to accurately determine actual water use during any calendar year during the period used to determine the base average usage, then that year shall be counted as having no water use.

(d) No flex account shall be allowed if the flex account is inconsistent with the provisions of any intensive groundwater use control area created

pursuant to K.S.A. 82a-1036 through K.S.A. 82a-1040, and amendments thereto.

(e) If water was authorized to be diverted for less than the entire period used to determine the base average usage, the five-year allocation shall be determined by means of these calculations:

(1) Adding the total actual, legal annual water use of the base water right or rights for the entire period used to determine the base average usage;

(2) dividing the total quantity by the number of years, or parts thereof, that water was authorized to be diverted by the chief engineer;

(3) multiplying that quantity by the BAUF; and

(4) multiplying that quantity by five.

Water rights that authorized use of water for less than two calendar years during the period used to determine the base average usage shall not be eligible for a flex account. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 2004 Supp. 82a-736, as amended by L. 2005, ch. 142, sec. 3; effective Oct. 11, 2002; amended Jan. 6, 2006.)

5-16-6. Flex accounts and term permits. (a) The duration of the flex account and term permit shall be five consecutive calendar years.

(b) There shall be no extension of a flex account or a term permit beyond the period of five consecutive calendar years originally authorized.

(c) There shall be no carryover of unused quantities of water from one flex account or term permit to another flex account or term permit.

(d) Only one flex account shall be in force for a point of diversion or a water right at any time.

(e) A water flowmeter meeting the requirements of the chief engineer shall be installed on each point of diversion authorized by the term permit. If an existing water flowmeter had been required on or after September 22, 2000 or if there is no existing water flowmeter, the water flowmeter shall meet the requirements of the chief engineer in effect at the time the term permit is approved. If a water flowmeter was installed before September 22, 2000, the water flowmeter shall meet the requirements of K.A.R. 5-1-6(b).

(f) Only an entire water right, or a portion of a water right that has been formally divided, may be deposited in a flex account.

(g) All water diverted pursuant to a term permit and the base water rights associated with the term permit shall be counted against the quantity of water deposited in the flex account. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 2001 Supp. 82a- 736; effective Oct. 11, 2002.)

5-16-7. Conditions under which a base water right may be exercised. Each term permit approved by the chief engineer according to this article shall include the condition that if the term permit can no longer be exercised because of an order issued by the chief engineer, including an intensive groundwater use control area order, a minimum desirable streamflow order, or an order to administer water rights to prevent impairment, then any base water right may be exercised to the extent that all of the following conditions are met:

(a) The base water right is in priority.

(b) The annual quantity of water authorized by the base water right has not been diverted during that calendar year.

(c) The five-year allocation authorized by the term permit has not been used.

(d) The use of water under the base water right does not impair water rights senior to the base water right. (Authorized by K.S.A. 82a-706a; implementing K.S.A. 82a-706a and K.S.A. 2001 Supp. 82a-736; effective Oct. 11, 2002.)

Article 17.—WATER BANKING

5-17-1. Definitions for water banking. As used in these water banking regulations, in the Kansas water banking act, K.S.A. 82a-761 et seq. and amendments thereto, and by the chief engineer in the administration of this act, unless the context clearly requires otherwise, the following words and phrases shall have the meanings ascribed to them in this regulation:

(a) "Bankable water right" means a water right, or portion of a water right, that meets the requirements of the following:

(1) K.S.A. 82a-764, and amendments thereto; and

(2) the water bank charter.

In calculating the portion of a water right that is bankable, credit shall be given for any water conservation practices implemented according to this regulation. The bankable portion of linked water rights shall be determined on a case-by-case basis. For a surface water right that has water available from a water assurance district, the quantity of water available from the water assurance district may be considered when determining how much of the water right is bankable.

(b) "Good standing," only for the purposes of

the Kansas water banking act and regulations, means a water right, or portion of a water right, that meets all of the following criteria:

(1) Except as set forth in paragraph (b)(2), the water right, or portion of a water right, has been lawfully put to beneficial use within the past five years.

(2) For a water right that has been enrolled in the water right conservation program (WRCP) or a water right whose authorized place of use has been enrolled in the conservation reserve program (CRP), the water right has been put to lawful beneficial use within the five-calendar-year period before enrollment in the program. A water right that is currently enrolled in the WRCP shall not be deposited in a water bank. If the authorized place of use is currently enrolled in the CRP, the water right shall not be deposited in a water bank, unless the authorized place of use has been changed to a place of use that is not enrolled in the CRP and water has actually been applied to beneficial use on the newly authorized place of use for at least one calendar year.

(3) All of the following conditions regarding the water right are met:

(A) In the five calendar years before the water right is deposited or placed in a safe deposit account, there has not been a conviction associated with that water right pursuant to K.S.A. 82a-728, and amendments thereto.

(B) No civil penalty has been assessed pursuant to K.S.A. 82a-737, and amendments thereto, against anyone for violations relating to the water right.

(C) The water right has not been suspended pursuant to K.S.A. 82a-737, and amendments thereto.

(D) No order of the chief engineer relating to the water right has been disobeyed.

(E) The applicant who is applying to deposit the water right into, or lease water from, a water bank or to withdraw water from a safe deposit account has a history of compliance with contracts with the water bank and term permits used to withdraw water from a water bank or from a safe deposit account.

(c) "Long-term rolling average," only for the purposes of the Kansas water banking act, means a five-year running average of the net consumptive use of all the participating rights. This average shall be calculated by adding together the average net consumptive use for each participating right in a hydrologic unit.

The average shall first be computed after the water bank has been in operation for three years. For each year after the third year, another year's data shall be added until five years of data are available. After the water bank has been in operation for five years or more, the last five years of data shall be used to calculate the average. The resulting number shall then be compared against the average annual net consumptive use of participating rights in that hydrologic unit for the representative past period.

(d) "Net consumptive use" means the gross diversion of water for beneficial use, minus the following:

(1) Waste of water, as defined in K.A.R. 5-1-1; and

(2) return flows to the source of water supply through surface water that is not waste and by deep percolation.

For irrigation use, only as used in the water banking act and regulations, net consumptive use shall be calculated as 85 percent of the actual legal gross diversions in any one calendar year or calculated using some other methodology approved by the chief engineer as complying with standard engineering practices. Net consumptive use for all other types of water use shall be calculated in accordance with a methodology approved by the chief engineer as complying with standard engineering practices.

The average annual net consumptive use for the representative past period shall be calculated by first calculating the average annual net consumptive use for each participating right for the representative past period and then adding those averages together. If a participating right did not legally divert water during any year in the representative past period or was not authorized to divert water, that year shall be counted as zero in computing the average annual consumptive use for that water right for the representative past period.

(e) "Participating rights" means all of the water rights in a hydrologic unit that are under contract to be deposited in a water bank or safe deposit account.

(f) "Representative past period" means a period of at least 10 consecutive years occurring entirely before the date on which the water bank is chartered and having a reasonable balance of years with above-normal and below-normal precipitation. For a water right not permitted during the entire representative past period, for the sole pur-

pose of determining the portion of that water right that is bankable pursuant to K.S.A. 82a-765(b)(9) and amendments thereto, the water bank may select a different representative past period, but the bankable portion of each water right shall be the lesser of either of the following:

(1) The annual quantity of water perfected; or

(2) the average percentage of water rights determined to be bankable, for all water rights in that hydrologic unit that were permitted for the representative past period occurring entirely before the date on which the bank was chartered.

(g) "Severely depleted groundwater aquifer" means an aquifer that meets any of the following criteria:

(1) The chief engineer has declared the aquifer to be an aquifer in need of recovery pursuant to K.S.A. 2-1919, and amendments thereto.

(2) The average static water level decline in the hydrologic unit, based on a representative sample of wells distributed throughout the hydrologic unit, in the 20 calendar years immediately preceding the calendar year in which the water bank was chartered is substantially greater than the average annual variability in the static water level in the hydrologic unit.

(3) The average yield of the groundwater aquifer is not sufficient to meet the 50 percent chance net irrigation requirements (N.I.R.) for crops typically grown in the hydrologic unit using methods of irrigation typically used in that hydrologic unit.

(h) "Severely depleted stream course" means a stream reach that has been declared by the chief engineer to be a stream reach in need of stream recovery pursuant to K.S.A. 2-1919, and amendments thereto.

(i) "Water conservation practices" means actual physical changes in a water distribution system or management practices that were made to improve water use efficiency during the representative past period, including the following:

(1) Conversion from flood irrigation to center pivot irrigation with a nozzle package designed to improve water use efficiency;

(2) irrigation scheduling;

(3) conversion to subsurface drip irrigation; and

(4) removal of an end gun, resulting in a reduction in the number of irrigated acres.

The applicant shall have the burden of documenting the implementation of water conservation practices that could have altered the results of the calculation of the portion of the water right that is bankable, to the detriment of the applicant. (Authorized by and implementing K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-2. Application to deposit a water right into a water bank or withdraw a deposit. (a) Each water right owner proposing to deposit all or a portion of a water right into a water bank shall complete an application on a form prescribed by the water bank and approved by the chief engineer. The application shall be filed with the water bank on or before December 31 of the year preceding the first calendar year in which the deposit will be made. A water right, or a portion of a water right, may be deposited only in increments of full calendar years. The application shall contain the following information concerning the water right, or portion of the water right, that is proposed to be deposited:

(1) The file number of the water right to be deposited;

(2) if the water right is a vested right or an appropriation right that has been certified by the chief engineer, specification of that status;

(3) the hydrologic unit from which the water right is authorized to withdraw water;

(4) the calendar years during which the water right will be on deposit. This period shall not exceed five years; and

(5) any CRP contracts that were in effect for any part of the representative past period.

(b) A water right may be withdrawn from deposit only if both of the following conditions are met:

(1) The water right has not been leased in whole or part.

(2) An application to withdraw the water right from deposit is made before July 1 of the calendar year for which the deposit has been made. Withdrawal of a water right during one calendar year also shall withdraw the water right from deposit in any subsequent years for which the water right may have been deposited. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-763, K.S.A. 2003 Supp. 82a-764, and K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-3. Contract for deposit of a water right. (a) Each water right owner that has an application approved for the deposit of all or a portion of a water right into a water bank and that desires to deposit all or a portion of the water right into the water bank shall enter into a contract with

the water bank that includes the following provisions and information:

(1) The file number of the water right to be deposited;

(2) the hydrologic unit from which the water is authorized to be withdrawn;

(3) the calendar years during which the water right will be on deposit, which shall not exceed five years;

(4) the quantity of water to be deposited;

(5) the terms of payment for the deposit;

(6) if a portion of a water right is deposited, an agreement that the quantity of water pumped under the portion of the water right that is not deposited shall not exceed the difference between the bankable portion of the water right and the amount deposited; and

(7) an acknowledgment of the specific fines or suspension penalties that will be imposed for violation of the contract.

(b) The water bank shall notify the chief engineer of each water right deposit before the deposit is leased. This notice shall include a determination of the annual quantity of water that is bankable for each water right and the portion of the bankable quantity of the water right that has been deposited. If an entire water right is deposited, no water may be pumped under that water right, except under the authority of a lease from a water bank and a term permit issued by the chief engineer to exercise that lease. If a portion of a water right is deposited, the annual quantity of water pumped under the portion of the water right that is not deposited shall not exceed the difference between the bankable portion of the water right and the amount deposited. An order may be issued by the chief engineer after the deposit notifying the owner of the annual quantity of water, if any, that may be diverted under the original water right to prevent the net consumptive use of the water right from being increased. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-763 and K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-4. Application to lease water. (a) Each person proposing to lease water from a water bank shall complete an application for a contract to lease water on a form prescribed by the water bank and approved by the chief engineer and an application for a term permit. The application for the contract shall be filed with the water bank. The application for a term permit shall be filed with the chief engineer. Each application shall include the following information concerning the water proposed to be leased:

(1) The quantity of water to be leased;

(2) the proposed maximum rate of diversion;

(3) the calendar years during which water is proposed to be leased, which shall not exceed the length of the water bank charter plus three calendar years;

(4) the location of the proposed point of diversion, including the hydrologic unit;

(5) the proposed place of use;

(6) the proposed use made of water;

(7) the water flowmeter reading from the proposed point of diversion, if the water will be diverted from an existing point of diversion, at the time the application is filed;

(8) the file numbers of the other water rights and approvals of applications that authorize use of water from the proposed point of diversion; and

(9) if the proposed use is for irrigation, the number of acres that will be irrigated and the number of acres of each type of crop that will be grown.

(b) Any water bank may enter into a lease extending beyond the length of the water bank charter only if both of the following conditions are met:

(1) The water bank charter has a procedure approved by the chief engineer that sets forth how the leases will be administered if the water bank is dissolved.

(2) The bank charter assigns the responsibility and cost of administering the leases after the water bank is dissolved to a responsible person or entity.

(c) Any applicant whose application meets all the criteria in subsections (a) and (b) may enter into a contract to lease water from the water bank if sufficient water rights have been deposited in the same hydrologic unit where the point of diversion and the place of use are proposed to be located to cover the lease. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-763 and K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-5. Contract to lease water. Any person who has an application approved by the water bank for the lease of water from the water bank may enter into a contract with the water bank to lease water. The contract shall be entered into before a term permit can be issued by the chief en-

gineer and shall include the following information and provisions:

(a) The quantity of water to be leased;

(b) the maximum rate of diversion at which the leased water will be diverted;

(c) the calendar years during which water will be leased, which shall not exceed the length of the water bank charter plus three calendar years;

(d) the location of the point of diversion where the leased water will be diverted, including the hydrologic unit;

(e) the use made of the water to be leased;

(f) the place of use of the water to be leased. The place of use shall be identical to a place of use authorized by an existing water right or approval of application, or shall be an entirely new place of use;

(g) the terms of payment for the lease of water;

(h) the penalties for breach of the lease, including those set forth in K.A.R. 5-17-13; and

(i) a provision that if the term permit is not obtained by a certain date or the term permit is dismissed for any reason, the contract shall not be exercised. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-763 and K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-6. Conditions on the term permit to exercise a contract to lease water. (a) A contract to lease water may be exercised only if the chief engineer approves an application for a term permit to divert the leased water.

(b) The following conditions shall be imposed by the chief engineer on the term permit authorizing the use of water leased from a water bank:

(1) The maximum reasonable quantity of water that may be diverted per calendar year, as set forth in K.A.R. 5-17-17, and the maximum quantity of water that may be diverted during the term of the permit;

(2) the maximum rate of diversion;

(3) the term of the permit, which shall not exceed the length of the water bank charter plus three calendar years;

(4) the authorized point of diversion;

(5) the authorized place of use;

(6) the authorized use made of the leased water;

(7) a provision that the diversion shall not cause the impairment of any existing water rights;

(8) a provision that the diversion shall not cause an increase in depletion to any severely depleted groundwater aquifer or severely depleted stream course;

(9) a provision that the leased water shall be diverted from, and used within, the same hydrologic unit where the water rights were deposited; and

(10) a provision that any violation of a term permit used to exercise a lease shall make the permittee subject to the penalty provisions of K.A.R. 5-17-13. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-763 and K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-7. Contract to deposit water in a safe deposit account. (a) Each person proposing to deposit water into a safe deposit account shall enter into a contract with the water bank on a form prescribed by the water bank and approved by the chief engineer. The contract shall include the following information and provisions and any other provision needed to ensure that the deposit complies with the provisions of the Kansas water banking act and regulations:

(1) The term of the contract, which shall be for a specific number of calendar years and shall not exceed the length of the water bank charter plus three years;

(2) the proposed deposit of water, which shall be from a water right that is bankable;

(3) the water right from which water is being deposited. The water right shall be in good standing and shall be vested or certified;

(4) the hydrologic unit from which water is being deposited;

(5) the terms of payment for the deposit and a provision that any fees paid are not refundable if the water user voids the contract, or causes it to be void, for any reason;

(6) the location of the point of diversion authorized by the water right that is proposed to be deposited;

(7) the water right file numbers of any linked water rights that are proposed to be deposited; and

(8) a provision that the contract shall be entered into by December 31 of the year preceding the first year for which the owner desires to make a deposit in the safe deposit account.

(b) The amount of water that may be deposited in any year shall not exceed 25 percent of the quantity of unused water from the preceding year.

(c) At the end of the term of the contract to

deposit water in a safe deposit account, including any extensions of time, all water in the account shall be forfeited.

(d) There shall not be multiple safe deposit accounts for any point of diversion.

(e) The term of a safe deposit account may be extended by the chief engineer upon request of the owner for a period not to exceed the length of the water bank charter plus three calendar years. Any water bank may extend a safe deposit account beyond the length of the water bank charter only if both of the following conditions are met:

(1) The water bank charter has a procedure approved by the chief engineer that sets forth how the safe deposit accounts will be administered if the water bank is dissolved.

(2) The bank charter assigns the responsibility and costs of administering the accounts after the water bank is dissolved to a responsible person or entity. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-763 and K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-8. Depositing water in a safe deposit account. (a) Each calendar year in which water is deposited, the depositor shall file a deposit slip, on a form prescribed by the water bank and approved by the chief engineer, with the water bank indicating the quantity of water that was unused and the quantity of water that the depositor proposes to deposit.

(b) Water shall be deposited in an existing safe deposit account no later than March 1 of the year following the calendar year in which the water was not used.

(c) When the deposit is made, the depositor shall furnish the water bank with the following information:

(1) The water flowmeter readings at the beginning and end of the calendar year in which the water was not used under the water right; and

(2) the quantity of water proposed to be deposited.

(d) The water bank shall accept for deposit the quantity of water that meets the provisions of the water bank charter and the Kansas water banking act and regulations. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-763 and K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-9. Term permit to use water that was deposited in a safe deposit account. (a) Before approval of a term permit to use water deposited in a safe deposit account, the water bank shall certify to the chief engineer the quantity of water that is in the safe deposit account.

(b) Before any water that has been deposited into a safe deposit account may be used, the applicant shall apply for a term permit, submit the appropriate filing fee, and receive approval from the chief engineer. Each term permit shall contain the following conditions:

(1) The maximum rate of diversion of water;

(2) the maximum quantity of water that may be diverted the remainder of that calendar year, which shall not exceed the quantity of water certified by the water bank to be in the safe deposit account;

(3) the length of the term permit, which shall not exceed December 31 of the year in which the term permit was issued by the chief engineer. No extensions of time shall be granted for this type of term permit;

(4) a provision that the use of water under the term permit shall not impair any existing water rights;

(5) a provision that the use of water under the term permit shall not cause an increase in the depletion of a severely depleted groundwater aquifer or severely depleted stream course; and

(6) a provision that violation of any of the terms of the term permit shall subject the owner to the penalty provisions of K.A.R. 5-17-13. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-763 and K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-10. Water bank charter proposal. (a) Each proposed water bank charter submitted to the chief engineer shall contain all of the following:

(1) Information showing that the proposed operations and policies of the water bank are consistent with the Kansas water banking act, the Kansas water appropriation act and regulations, the Kansas state water plan, the policies of any groundwater management district that is located within the boundaries of the proposed water bank, and the water assurance district operation agreements of any water assurance district located within the boundaries of the proposed water bank;

(2) information that demonstrates that there is sufficient participation to make the water bank's

operations practical and feasible, including economically;

(3) a petition declaring an intent to establish a water bank that is signed by at least five percent of the water right owners within the water bank's proposed boundaries;

(4) the names of at least five members of the proposed governing body of the water bank, their addresses, and the public and private interests that each represents;

(5) the proposed boundaries of the water bank, including information showing that the boundaries of the proposed water bank do not overlap the boundaries of another water bank;

(6) for groundwater banks, an enumeration of all the hydrologic units and sources of water supply within the water bank boundaries, including alluviums, terrace deposits, and regional aquifers, both confined and unconfined, that have similar aquifer properties. The aquifer properties shall include the saturated thickness and water level changes over the representative past period;

(7) for a water bank that includes surface water, a list of the streams and their tributaries that are to comprise the water bank and a methodology to limit the leasing of surface water so that it does not impair senior surface water rights and minimum desirable streamflow;

(8) the designation of a representative past period;

(9) a comprehensive method to account for the following:

(A) The amount of water deposited and the length of the contracts for deposit;

(B) the amount of water leased from the water bank and the length of the lease contracts; and

(C) the identification of the hydrologic units from which deposits and leases are being made;

(10) for a water bank that includes the use of groundwater, a proposed plan to ensure that the net amount of water consumed by the deposited water rights will be at least 10 percent less than the average net amount of water consumed by the deposited water rights for the representative past period. The proposed plan shall require the comparison of the average annual net consumption for the deposited water rights for the five-year period after a water bank is chartered or rechartered with the average net consumptive use for the deposited water rights for the representative past period;

(11) a list of any severely depleted groundwater aquifers or severely depleted stream courses;

(12) a plan to ensure that there will be no increase in the depletion of severely depleted groundwater aquifers or severely depleted stream courses;

(13) a method for determining the water rights that are bankable and the portion that is bankable;

(14) a procedure for dissolution of the water bank;

(15) for a bank using groundwater, a methodology for ensuring that the total quantity of groundwater leased each year does not exceed 90 percent of the average annual quantity collectively diverted pursuant to all deposited water rights or portions of water rights from each hydrologic unit for the representative past period;

(16) for a water bank that authorizes safe deposit accounts, a methodology to ensure that the users of safe deposit accounts will not increase the consumption of groundwater; and

(17) for a water bank that authorizes safe deposit accounts, a provision setting the maximum percentage of unused water from the previous year that may be deposited in a safe deposit account.

(b) After the body wishing to charter the water bank submits the proposed water bank charter to the chief engineer, it shall be circulated by the chief engineer to any groundwater management districts and water assurance districts located within the boundaries of the proposed water banks and to the Kansas water office for comments as to whether the proposed water bank charter complies with the provisions of K.S.A. 82a-765, and amendments thereto. Comments regarding the proposed water bank charter shall be due within 30 days after comments are requested by the chief engineer, unless an extension of time is requested within the time allowed and granted by the chief engineer for good cause shown. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-765 and K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-11. Annual reports of water banks. Each water bank shall file an accounting report with the chief engineer each calendar year containing the following information: (a) The file numbers of the water rights, or portion of the water rights, deposited in the water bank;

(b) the annual quantity of water authorized for diversion for each water right deposited and a determination of the bankable quantity of water associated with each deposited water right;

(c) the term of each deposit;

(d) the hydrologic unit from which each water right was deposited;

(e) the file number of each term permit authorizing a lease of water;

(f) the term of the lease;

(g) the annual quantity of water that has been leased from each hydrologic unit;

(h) the hydrologic units where the leased water was diverted;

(i) the net year-end balance of water deposited versus water leased in each hydrologic unit within the water bank's boundaries;

(j) the annual quantity of water deposited into safe deposit accounts;

(k) the annual quantity of water used from safe deposit accounts;

(l) the hydrologic unit in which water was deposited in a safe deposit account;

(m) the total year-end balance of water remaining in safe deposit accounts after the 10 percent year-end reduction for all individual accounts;

(n) the total quantity of water diverted during the last three calendar years, by type of use;

(o) the total number of acres irrigated and the number of acres of each crop grown during the last three calendar years;

(p) any contracts that were breached, the nature of the breaches, and the enforcement actions taken by the water bank; and

(q) the average annual quantity of water diverted during the representative past period of each water right that has been deposited in the water bank. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-766 and K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-12. Water use reports. (a) Each owner of a water right authorized for irrigation use that deposits a water right in a water bank or deposits water in a safe deposit account, and each person that leases water for irrigation use and any linked water rights, shall file the water use report required by K.S.A. 82a-732, and amendments thereto, on or before December 1 of the year for which water use is being reported.

(b) Each owner of a water right authorized for non-irrigation use that deposits a water right in a water bank or deposits water in a safe deposit account, and each person that leases water for non-irrigation use and any linked water rights, shall file the water use report required by K.S.A. 82a-732, and amendments thereto, on or before January 10 of the year following the year for which water use is being reported.

(c) The failure of a water right owner to submit a complete and accurate water use report, including water flowmeter readings, as required by this regulation shall result in civil fines in the amounts set forth in K.A.R. 5-14-11.

(d) If a water use report is inadequate to accurately determine the actual water use during any calendar year, then that year shall be counted as having had no water use for the purpose of determining the extent to which a water right is bankable pursuant to K.S.A. 82a-764, and amendments thereto, unless the water use report is corrected as set forth in K.A.R. 5-3-5o. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-766 and K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-13. Enforcement. If any person violates any of the following, enforcement action may be taken by the chief engineer as specified in K.A.R. 5-14-1 and K.A.R. 5-14-10:

(a) A term, condition, or limitation of a term permit issued to authorize the diversion of leased water;

(b) a term, condition, or limitation of a term permit issued to withdraw water from a safe deposit account;

(c) a term, condition, or limitation of a water right that has been deposited in the water bank or a safe deposit account;

(d) any order of the chief engineer concerning the deposit or lease of a water right; or

(e) any order or condition placed on the use of the remainder of a water right that was partially deposited in the water bank or a safe deposit account. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-769 and K.S.A. 2003 Supp. 82a-770; effective Aug. 13, 2004.)

5-17-14. Water flowmeters. (a) The following points of diversion shall meet the requirements specified in subsection (b):

(1) Within a groundwater bank, all non-domestic, non-temporary wells within the boundaries of the water bank;

(2) within a surface water bank, all non-domestic, non-temporary surface water points of diversion within the boundaries of the water bank; and

(3) within a groundwater and surface water bank, all non-domestic, non-temporary points of diversion within boundaries of the water bank.

(b) While a water bank is operating, each of the points of diversion described in subsection (a) shall meet one of the following requirements:

(1) Be equipped with a water flowmeter meeting the requirements of K.A.R. 5-1-4 through K.A.R. 5-1-12;

(2) be sealed by the chief engineer; or

(3) be approved by the chief engineer as having another objectively verifiable means of determining that water has not been pumped, including capping the well, removal of the pump, or removal of a permanent power source.

(c) If a water flowmeter does not function properly whenever water is being diverted, it shall be assumed, for the purpose of determining compliance with the water right and the term permit issued to withdraw leased water or water deposited in a safe deposit account, that the diversion works have been operated continuously at the tested rate of diversion since the last time the waterflow meter was confirmed by the chief engineer or a groundwater management district to have been operating properly. If the diversion works have not been tested by the chief engineer or a groundwater management district, it shall be assumed that the diversion works have been operated continuously at the authorized rate of diversion during the entire time the water flowmeter was out of compliance. Either of the assumptions specified in this subsection may be rebutted if the water right owner submits objective documentation of the actual quantity of water diverted while the water flowmeter was out of compliance. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-766 and K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-15. Private sale or lease of water right facilitated by a water bank. If a water bank provides services to facilitate the sale or lease of water rights, the owner of the water rights that are bought, sold, or leased between private parties shall be required to comply with all applicable statutes and regulations, including any regulation of the chief engineer limiting the distance that a point of diversion may be moved. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-763 and K.S.A. 2003 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-16. Priority of use of water rights and permits. (a) If multiple water rights or permits authorize the use of water from a single point of diversion, the water shall be considered to be used in the order of priority with the earliest priority first.

(b) If the water used exceeds the total quantity of water authorized by the water rights and permits described in subsection (a) that authorize water use from that point of diversion, all water rights and permits under which the water was lawfully diverted shall be deemed to be violated unless this presumption is rebutted by one or more of the water right owners. (Authorized by K.S.A. 2003 Supp. 82a-769; implementing K.S.A. 2003 Supp. 82a-769 and K.S.A. 2003 Supp. 82a-770; effective Aug. 13, 2004.)

5-17-17. Waste of leased water and safe deposit account water. For using leased water or water withdrawn from a safe deposit account, the quantity not considered to be waste for irrigation use shall be 150 percent of the value specified in K.A.R. 5-3-24 for the county where the point of diversion is located. (Authorized by K.S.A. 2002 Supp. 82a-769; implementing K.S.A. 2002 Supp. 82a-763 and K.S.A. 2002 Supp. 82a-769; effective Aug. 13, 2004.)

5-17-18. Reimbursable and non-reimbursable costs. (a) The following costs incurred by the chief engineer for assistance and services to implement the Kansas water banking act shall be reimbursable by a water bank:

(1) The cost of reviewing and approving a proposed water bank charter;

(2) the cost of determining the extent to which a water right is bankable and in good standing;

(3) the cost of reviewing an annual report filed by a water bank and conducting the analysis necessary to determine if the water bank has complied with the terms of the Kansas water banking act;

(4) extra costs incurred to require water use reports to be filed earlier than March 1, the tracking of that information, and reporting that information to a water bank;

(5) increased costs incurred to provide other water use and water right information to water banks or water bank customers;

(6) the costs to monitor and enforce the provisions of the Kansas water banking act;

(7) the costs of meetings and other discussions with water bank officials and employees;

(8) the cost of enforcement of terms, conditions, and limitations of term permits issued to

allow withdrawal of leased water and water from safe deposit accounts;

(9) if additional enforcement of water rights and permits is requested by a water bank, enforcement costs that would not have been incurred by the chief engineer in the ordinary course of business against all water rights diverting water from within the boundaries of the water bank to prevent overpumping; and

(10) the cost incurred if a water bank or a water bank customer requests the chief engineer to hold an abandonment hearing necessary to determine whether a water right is bankable that would not have been done in the ordinary course of business by the chief engineer at that time.

(b) The following costs incurred by the chief engineer for assistance and services to implement the Kansas water banking act shall not be reimbursable by a water bank:

(1) The cost of issuing a term permit to allow diversion of leased water;

(2) the cost of issuing a term permit to allow withdrawal of water from a safe deposit account;

(3) enforcement costs that the chief engineer would have incurred in the ordinary course of business to take action against all water rights diverting water from within the boundaries of the water bank to prevent overpumping; and

(4) the cost of adopting regulations to implement the act. (Authorized by K.S.A. 2002 Supp. 82a-769; implementing K.S.A. 2002 Supp. 82a-769 and K.S.A. 2002 Supp. 82a-771; effective Aug. 13, 2004.)

Articles 18 to 20.—RESERVED

Article 21.—WESTERN KANSAS GROUNDWATER MANAGEMENT DISTRICT NO. 1

5-21-1. Definitions. As used in these rules and regulations, the following words and phrases shall have the meaning ascribed to them in this section.

(a) "Aquifer" means a geologic water-bearing formation that will yield considerable quantities of water to wells and springs.

(b) "Board" means the board of directors constituting the governing body of the western Kansas groundwater management district no. 1.

(c) "Chief engineer" means the chief engineer of the division of water resources of the Kansas state board of agriculture.

(d) "District" means the western Kansas groundwater management district no. 1.

(e) "Authorized representative of the board" means an individual designated by the board to perform duties and functions on its behalf.

(f) "Groundwater" means water below the surface of the earth.

(g) "Substantially" means within 300 feet of the approved location, but in no case closer to other wells than the minimum spacing requirements allow.

(h) "Tailwater" means that portion of the irrigation water applied which appears as run-off from the authorized place of use.

(i) "Tailwater re-use system" means a facility to collect, store and transport irrigation tailwater for reapplication to the authorized place of use.

(j) "Unconsolidated aquifer" means unconsolidated deposits that will yield water in a sufficient quantity to supply pumping wells and springs.

(k) "Waste of water" means any act or omission which causes:

(1) groundwater to be diverted or withdrawn from a source of supply and not used, managed or reapplied to a beneficial use on or in connection with land authorized as the place of use by a vested right, an appropriation right or an approved application for permit to appropriate water for beneficial use;

(2) the unreasonable deterioration of the quality of water in any source of supply thereby causing impairment of a person's right to the use of water;

(3) groundwater intended for irrigation use to escape and drain from the authorized place of use; or

(4) groundwater to be applied to an authorized beneficial use in excess of the needs for such use.

(l) "Well" means any excavation that is drilled, cored, bored, washed, driven, dug or otherwise constructed when the intended use of such excavation is for the acquisition, diversion, or artificial recharge of groundwater. (Authorized by K.S.A. 82a-1028(o); effective May 1, 1979; amended May 23, 1994.)

5-21-2. Tailwater control and waste. No water user shall allow water which is pumped or diverted from any aquifer to leave the land under the water user's direct supervision and control. If the water is re-used, the user shall apply the water consistent with the approved application to appropriate water for beneficial use, vested right, or

appropriation right. All water users shall construct and operate the water distribution systems in a manner as to prevent waste of water, and shall do everything necessary and proper to preserve the quality of the groundwater resources within the district. (Authorized by K.S.A. 1978 Supp. 82a-1028(o); effective May 1, 1979.)

5-21-3. Well spacing requirements. (a) Each well location described in an application for a permit to appropriate water for a beneficial use, other than domestic use, which proposes the diversion or withdrawal of water from the Ogallala formation shall be spaced a minimum of 2640 feet from all other non-domestic wells in the Ogallala aquifer.

(b) (1) Each well location described in an application to appropriate water for a beneficial use, other than domestic use, which proposes the diversion or withdrawal of water from the Dakota aquifer shall be spaced a minimum of two thousand six hundred forty (2,640) feet from any other well constructed into the same Dakota aquifer.

(2) Each Dakota well shall be sealed off between the Dakota aquifer and any other aquifers in such a manner as to prevent migration of water to or from the Dakota aquifer and any other aquifers.

(c) Each well included in an application to appropriate water for a beneficial use, other than domestic use, which proposes the diversion or withdrawal of water shall be a minimum of 1,320 feet away from a domestic well constructed into the same aquifer unless the applicant has received written permission from the neighboring well owner or the domestic wells are owned by the applicant.

(d) The location of a well or wells on an application for approval to change the point of diversion under an existing water right shall be no more than 1,320 feet from the originally authorized point of diversion and shall:

(1) not decrease the distance to other wells or authorized well locations by more than 300 feet; or

(2) meet the minimum well spacing requirements in this regulation.

(e) A new well shall be drilled in a location substantially as shown on the approved application and the accompanying map, plat, or aerial photograph.

(f) Exceptions to this well spacing regulation may be granted on an individual basis by recommendation of the board in conjunction with the approval of the chief engineer. The applicant may be required by the board to submit information as it deems necessary in order to make the determination. (Authorized by K.S.A. 82a-1028(o); effective May 1, 1979; amended May 23, 1994.)

5-21-4. Safe yield. (a) Except as set forth in subsection (c), the district shall be closed to further new appropriations of water in all areas where the total saturated thickness of the unconsolidated aquifer, commonly known as the Ogallala, meets either of these criteria:

(1) Has been depleted by 15 percent or more since 1950, as determined according to K.A.R. 5-21-8; or

(2) is less than 40 feet thick, as determined according to K.A.R. 5-21-9.

(b) In the rest of the district, the approval of each application for a permit to appropriate water for a beneficial use, except as set forth in subsection (c), from the Ogallala aquifer, and the approval of each application for a change in the point of diversion if the diversion works have not been completed under the original approved application, shall be subject to the following criteria:

(1) The proposed appropriation, when added to the vested rights, prior appropriation rights, and earlier priority applications, shall not exceed the allowable safe yield amount for the area included within a two-mile-radius circle, which is approximately 8,042 acres, of the proposed well.

(2) For the purpose of analysis, all vested rights, certificates, permits, and prior unapproved applications shall be considered to be fully exercised, and all limitation clauses listed on permits to appropriate water and certificates shall be considered to be in force.

(3) In the case of an application for change in the point of diversion referred to in subsection (b), each application and water right with a priority earlier than the priority established by the filing of the application for change shall be included in the analysis.

(4) The allowable annual safe yield amount shall be calculated using the following formula:

$$Q = \frac{AR}{12}$$

Q = the allowable annual safe yield amount in acre-feet per year

A = area of consideration, within a two-mile-radius circle, approximately 8,042 acres

R = average annual recharge of 0.5 inches per year

(5) If part of the radial area is located outside the district boundary, it shall be included in the depletion analysis only if the chief engineer determines that hydraulically connected groundwater exists in that portion of the area outside the district. A part of the area of consideration lying outside the state of Kansas shall not be included in the analysis.

(6) If wells authorized under a vested right, a certified water right, or a permit to appropriate water are divided by the circumference of the radial area, the authorized quantity of water shall be assigned to each well. If specific quantities are not authorized for each well, a proportional amount shall be assigned to each well.

(c) This regulation shall not apply to the following:

(1) Domestic use;

(2) temporary permits; and

(3) a new application filed to appropriate groundwater in any area of the district not closed by regulation or intensive groundwater use control area order by the chief engineer to new nondomestic, nontemporary permits and term permits for five or fewer years, meeting all of the following criteria:

(A) The sum of the annual quantity requested by the proposed appropriation and the total annual quantities authorized by prior permits allowed because of an exemption pursuant to this subsection does not exceed 15 acre-feet in a ½-mile-radius circle surrounding the proposed point of diversion.

(B) Well spacing criteria in the area have been met.

(C) The approval of the application does not authorize an additional quantity of water out of an existing authorized well with a nondomestic permit or water right that would result in a total combined annual quantity of water authorized from that well in excess of 15 acre-feet.

(D) All other criteria for approving a new application to appropriate water at that location have been met.

(d) Exceptions to this regulation may be granted on an individual basis by recommendation by the board in conjunction with the approval of the chief engineer. The applicant may be required by the board to submit information necessary in order to make the determination. (Authorized by K.S.A. 82a-706a and K.S.A. 82a-1028(o); implementing K.S.A. 82a-1028(n); effective May 23, 1994; amended Sept. 22, 2000.)

5-21-5. Battery of wells. Within the boundaries of the district, an application for change of point of diversion from one well to a battery of wells shall not be approved unless the application meets the following criteria:

(a) The proposed points of diversion constitute a "battery of wells" as defined in K.A.R. 5-1-1.

(b) If the application for change has been filed pursuant to an appropriation right, the certificate shall be issued before approval of the application for change.

(c) The maximum annual quantity and maximum instantaneous diversion rate approved shall not exceed the maximum annual quantity and the maximum instantaneous diversion rate actually used during any of the three consecutive full calendar years before the application.

(d) The application meets the criteria for the approval of a new application. However, the wells comprising the battery of wells shall not be required to meet the well spacing requirements of K.A.R. 5-21-3 in relationship to each other. (Authorized by K.S.A. 82a-706a and K.S.A. 82a-1028(o); implementing K.S.A. 82a-1028(n); effective Sept. 22, 2000.)

5-21-6. Water-measuring devices. (a) Except as specified in subsections (b) and (e), each well authorized after the effective date of this regulation within the boundaries of the district shall be equipped with a water flowmeter that is installed and maintained in accordance with the specifications in K.A.R. 5-1-4 through 5-1-12. Each water right owner shall maintain the water flowmeter so that the flowmeter functions properly whenever the diversion of water can reasonably be expected to occur. If the water flowmeter fails to function properly, the owner shall promptly initiate action to repair or replace the meter, or to correct any problems with the installation.

(b) If the owner of the water right demonstrates to the board that the installation of a water flowmeter meeting the requirements of subsection (a) is not feasible, the installation of an hour meter in lieu of a water flowmeter may be approved by the board. Installation of a water flowmeter shall be considered to be not feasible if all of the following conditions are met:

(1) The diversion works and the delivery sys-

tem are both in existence before the order of the board to install a water-measuring device.

(2) The owner enters into a written agreement with the district providing that the owner will perform the following:

(A) Notify the district whenever the diversion works or the delivery system is modified; and

(B) install a water flowmeter when the diversion works or delivery system is modified, unless a waiver is granted by the board.

(3) Either of the following conditions is met:

(A) The normal operating rate of diversion is less than 200 gallons per minute.

(B) The diameter of the existing pipe is too large for the normal operating flow rate so that full pipe flow cannot be maintained through a water flowmeter.

(c) Each well location authorized before the effective date of this regulation and located within the boundaries of the district shall be equipped with a water-measuring device that was acceptable at the time the water-measuring device was required. Waivers or exemptions to the installation of a water flowmeter granted by the district before the effective date of this regulation shall be considered to be effective until one of the following occurs:

(1) The well is redrilled.

(2) The delivery system is modified.

(3) The water-measuring device is no longer functioning properly and is not promptly repaired.

(4) The district or the chief engineer orders that the well be equipped with a water flowmeter.

(d) An hour meter installation shall be deemed acceptable if all of the following requirements are met:

(1) The hour meter shall be enclosed in a weatherproof box and installed on a stand or post separate from, but adjacent to, the pumping plant base.

(2) The wiring from the pumping plant to the hour meter shall be at least 16 gauge and shall be enclosed in a conduit.

(3) All electrical connections shall be firmly attached.

(e) The following types of water use shall be exempt from the requirements of this regulation:

(1) Domestic use; and

(2) temporary use. (Authorized by K.S.A. 82a-706a and K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5; implementing K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5 and K.S.A. 2001 Supp. 82a-1903, as amended by L. 2002, Ch. 137, § 7; effective Jan. 24, 2003.)

5-21-7. Change in the use made of water from irrigation use to any other type of beneficial use. A change in the use made of water from irrigation use to any other type of beneficial use shall not be approved if any of the following conditions is met: (a) The application for change does not meet the requirements of K.A.R. 5-5-9.

(b) The rate of diversion applied for exceeds the rate of diversion as determined by a test of the normal operating rate of diversion conducted within 1,095 days before the date the application for change was filed.

(c) The maximum annual quantity of water applied for is in excess of any of the following:

(1) The maximum annual quantity of water determined for a vested right;

(2) the maximum annual quantity of water certified; or

(3) the average annual quantity of water actually used in the preceding 10 calendar years, excluding those years in which the water right was enrolled in the water right conservation program, the conservation reserve program, or any other multiyear water conservation program approved by the chief engineer. (Authorized by K.S.A. 82a-706a and K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5; implementing K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5 and K.S.A. 2001 Supp. 82a-1903, as amended by L. 2002, Ch. 137, § 7; effective Jan. 24, 2003.)

5-21-8. Percent change of saturated thickness. The map titled "percent change in saturated thickness of the High Plains aquifer, west central Kansas, 1950 to average 1997-1999" and designated as the Kansas geological survey open file report 2000-15B, dated July 25, 2000, is hereby adopted by reference. (Authorized by K.S.A. 82a-706a and K.S.A. 82a-1028(o); implementing K.S.A. 82a-1028(n); effective Sept. 22, 2000.)

5-21-9. Saturated thickness. The map titled "saturated thickness of unconsolidated aquifer, west central Kansas average 1997-1999" and designated as the Kansas geological survey open file report 2000-15A, dated July 25, 2000, is hereby adopted by reference. (Authorized by K.S.A. 82a-706a and K.S.A. 82a-1028(o); implementing K.S.A. 82a-1028(n); effective Sept. 22, 2000.)

Article 22.—EQUUS BEDS GROUNDWATER MANAGEMENT DISTRICT NO. 2

5-22-1. Definitions. As used in article 22 of these regulations, by the Equus Beds groundwater management district no. 2 in the implementation of the groundwater management district act and by the division of water resources in the administration of the Kansas water appropriation act, the following terms shall have the meanings ascribed to them in this regulation, unless the context clearly requires otherwise.

(a) "Above-baseflow stage" means streamflow that is in response to a significant runoff event during which period the water-level elevation of the stream is greater than the elevation of the adjacent water table.

(b) "Aquifer" means any geologic formation capable of yielding water in sufficient quantities that it can be diverted for beneficial use.

(c) "Aquifer storage" means the act of storing water in the unsaturated portion of an aquifer by artificial recharge for subsequent diversion and beneficial use.

(d) "Aquifer storage and recovery system" means a physical infrastructure that meets the following conditions:

(1) Is constructed and operated for artificial recharge, storage, and recovery of source water; and

(2) consists of apparatus for diversion, treatment, recharge, storage, extraction, and distribution.

(e) "Area of consideration" means the two-mile-radius circle whose center is the location of the proposed point of diversion. The area of consideration equals 8,042 acres minus the area of the circle that meets the following conditions:

(1) Is outside the district boundary;

(2) is inside an intensive groundwater use control area with a declining water table; and

(3) is in an area where the bedrock is not overlain by an aquifer.

(f) "Artificial recharge" means the use of source water to artificially replenish the water supply in an aquifer.

(g) "Bank storage" means water absorbed by and temporarily stored in the banks and bed of a stream during above-baseflow stage.

(h) "Bank storage well" means a well used to divert or withdraw water from bank storage.

(i) "Baseflow" means groundwater that seeps, flows, or is otherwise naturally discharged from an aquifer into a stream.

(j) "Baseflow allocation" means the annual quantity of water assigned to a baseflow node expressed in acre-feet per calendar year. The natural discharge to the stream shall be assumed to be equivalent to the rate of flow in the stream that is equaled or exceeded 90 percent of the time.

(k) "Baseflow node" means an artificial point located in the channel of a watercourse for the purpose of allocating a proportional amount of the baseflow.

(l) "Basin storage area" means the portion of the aquifer's unsaturated zone used for aquifer storage that has defined horizontal boundaries and is delimited by the highest and lowest index water levels.

(m) "Basin storage loss" means that portion of artificial recharge naturally flowing or discharging from the basin storage area.

(n) "Battery of wells" means either of the following:

(1) A group of two or more wells that meets the following conditions:

(A) Withdraws water from the same local source of supply;

(B) is connected to a common pump by a manifold or piping; and

(C) supplies water to a common distribution system; or

(2) a group of not more than four wells that meets the following conditions:

(A) Withdraws water from the same local source of supply;

(B) is located within a 300-foot-radius circle of the geographic center of the battery of wells;

(C) supplies water to a common distribution system;

(D) does not exceed a combined capacity of 800 gallons per minute; and

(E) has an individual pump installed in each well with a maximum capacity of 400 gallons per minute.

A battery of wells shall be considered to be one point of diversion.

(o) "Board" means the board of directors constituting the governing body of the Equus Beds groundwater management district no. 2.

(p) "Completed substantially as shown on aerial photograph, topographic map, or plat" means within 300 feet of the location as shown on the aerial photograph, topographic map, or plat accompanying the application.

(q) "Confined aquifer" means either of the following:

(1) An aquifer overlain and underlain by impermeable layers; or

(2) an aquifer in which the groundwater is under pressure greater than atmospheric pressure and will rise in a well above the elevation at which groundwater is first encountered.

(r) "Conjunctive use" means the management of the aquifer to achieve safe yield and the operation of the aquifer in coordination with a surface water system to enhance the use of the total water supply availability, in accordance with the provisions of the Kansas water appropriation act.

(s) "Consumptive use" means gross diversion minus the following:

(1) Waste of water; and

(2) return flows to the source of water supply by at least one of the following:

(A) Through the surface water runoff that is not waste; and

(B) by deep percolation.

(t) "District" means the Equus Beds groundwater management district no. 2.

(u) "Free-water surface" means water that is exposed to the atmosphere, including lakes, ponds, and pits that intercept the water table.

(v) "Geographic center" means either of the following:

(1) The arithmetic mean of the northing and westing coordinates or measurements for each well in a battery of wells; or

(2) the apparent center of a groundwater pit.

(w) "Groundwater" means water below the surface of the earth.

(x) "Groundwater pit" means an excavation in the earth that meets all of the following criteria:

(1) Exposes the current or historic groundwater table;

(2) has caused, or will likely cause, annual evaporation of groundwater; and

(3) has a perimeter equal to or greater than the depth of the excavation.

(y) "Index water level" means water-level elevations established spatially throughout a basin storage area to be used to represent the maximum volume of a basin storage area and the volume of stored water available for recovery, based upon accounting methodology and the conditions of the permit.

(z) "Non-consumptive use" means the beneficial use of water in which essentially all of the water diverted from the source of supply is returned to the source of supply.

(aa) "Person" means a natural person, a partnership, an organization, a corporation, a municipality, and any agency of the state or federal government.

(bb) "Point of diversion" means the point at which water is diverted or withdrawn from a source of water supply.

(cc) "Primary well" means a well equipped with a flowmeter for which a standby well is available.

(dd) "Recharge" means the natural infiltration of surface water or rainfall into an aquifer from its catchment area.

(ee) "Recharge credit" means the quantity of water that is stored in a basin storage area and that is available for subsequent appropriation for beneficial use by the operator of the aquifer storage and recovery system.

(ff) "Safe yield" means the total quantity of groundwater meeting the following conditions:

(1) Can be artificially withdrawn from an aquifer; and

(2) naturally discharges to a stream without exceeding the aquifer recharge value for the area of consideration and without impairing the water rights diverting from the aquifer.

(gg) "Standby well" means a well that meets the following conditions:

(1) Is used to provide water for any of the following:

(A) Fire protection;

(B) emergency purposes; or

(C) any period during which the primary well has mechanical failure, maintenance, or power failure;

(2) is maintained in good operating condition;

(3) withdraws water from the same source of supply as the primary well;

(4) is located within 300 feet of the primary well;

(5) is limited to the same rate and quantity authorized by the primary well's appropriation or vested right;

(6) is equipped with a flowmeter; and

(7) is operated only when water is temporarily unavailable from the primary well or wells, except when water is needed for fire protection or a similar type of emergency.

(hh) "Stream" means any watercourse that has a well-defined bed and well-defined banks, and that flows continuously during the calendar year, except during periods of drought.

(ii) "Surface water" means water in creeks, rivers, or other watercourses, and in reservoirs, lakes, and ponds. This term shall not include water in groundwater pits.

(jj) "Thermal exchange" means the use of water for climate control in a nondomestic building and in a manner that is essentially nonconsumptive to the source of supply.

(kk) "Unconfined aquifer" means an aquifer with a water table at atmospheric pressure.

(ll) "Waste of water" means any act or omission that causes any of the following:

(1) The diversion or withdrawal of water from a source of supply that is not used or reapplied to a beneficial use on or in connection with the place of use authorized by a vested right, an appropriation right, or an approval of application for a permit to appropriate water for beneficial use;

(2) the unreasonable deterioration of the quality of water in any source of supply, thereby causing impairment of a person's right to the use of water;

(3) the escaping and draining of water intended for irrigation use from the authorized place of use; or

(4) the application of water to an authorized beneficial use in excess of the needs for this use.

(mm) "Water balance" means the method of determining the amount of water in storage in a basin storage area by accounting for inflow to, outflow from, and changes in storage in that basin storage area.

(nn) "Water table" means the top or surface of an unconfined or confined aquifer at which the pore water pressure is atmospheric.

(oo) "Well" means any excavation that is drilled, cored, bored, washed, driven, dug, or otherwise constructed if the intended use of the excavation is for the acquisition, diversion, or artificial recharge of groundwater. (Authorized by and implementing K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; effective May 1, 1979; amended Oct. 15, 1990; amended March 7, 1994; amended Nov. 12, 2004.)

5-22-2. Well spacing requirements. (a) Except as specified in subsections (d) and (e), the minimum spacing of all nondomestic and nontemporary wells described in an application for permit to appropriate water for beneficial use, an application for a term permit, or application to change the point of diversion shall be the following:

(1) 1,320 feet from all nondomestic wells, groundwater pits, and baseflow nodes; and

(2) 660 feet from all domestic wells.

(b) The minimum spacing interval from the geographic center of a battery of wells to each nondomestic well, groundwater pit, and baseflow node shall be 1,620 feet. The minimum spacing interval from the geographic center of a battery of wells to each domestic well shall be 960 feet.

(c) The minimum spacing interval from the edge of a groundwater pit to each nondomestic well, the edge of any other groundwater pit, and baseflow node shall be 1,320 feet and 330 feet to a domestic well.

(d)(1) In the areas described in the following table, the requirements specified in paragraphs (2), (3), and (4) of this subsection shall apply:

Township	Range	Section	County
23 South	6 West	31, 32 and 33	Reno
23 South	7 West	31 through 36	Reno
24 South	6 West	4 through 9, and 13 through 36	Reno
24 South	7 West	1 through 36	Reno
25 South	5 West	30 and 31	Reno
25 South	6 West	1 through 36	Reno
25 South	7 West	1 through 36	Reno
26 South	5 West	6, 7, and 8; 17 through 21; and 27 through 35	Reno
26 South	6 West	1 through 36	Reno
26 South	7 West	1 through 36	Reno

(2) The minimum spacing of all nondomestic and nontemporary wells with an authorized rate of diversion of 401 gallons per minute or more, as described in an application for permit to appropriate water for beneficial use, term permit, or application to change the point of diversion, shall be the following:

(A) 2,640 feet from all other nondomestic wells, groundwater pits, and baseflow nodes; and

(B) 660 feet from all domestic wells.

(3) The minimum spacing of a battery of wells with a total authorized rate of diversion of 401 gallons per minute or more, as described in an application for permit to appropriate water for beneficial use, term permit, or application to change the point of diversion shall be the following:

(A) 2,940 feet from all nondomestic wells, groundwater pits, and baseflow nodes; and

(B) 960 feet from all domestic wells.

(4) The minimum spacing interval from the

edge of a groundwater pit to each nondomestic well, the edge of any other groundwater pit, and baseflow node shall be 1,320 feet. The minimum spacing interval from the edge of a groundwater pit to a domestic well shall be 330 feet.

(e) The following types of wells shall not be subject to this well-spacing regulation:

(1) A standby well;

(2) a bank storage well;

(3) a well authorized pursuant to the approval of an application to change the point of diversion that meets both of the following conditions:

(A) The number of wells comprising the point of diversion remains unchanged; and

(B) each point of diversion is proposed to be relocated 300 feet or less from the currently authorized location;

(4) the minimum spacing interval of nondomestic wells to domestic wells, if the domestic well owner has granted written permission to reduce the spacing interval; and

(5) the minimum spacing interval of groundwater pits to nondomestic, nontemporary, or domestic wells, if the well owner has granted written permission to reduce the spacing interval. (Authorized by and implementing K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5; effective May 1, 1979; amended Oct. 15, 1990; amended March 7, 1994; amended Jan. 10, 2003.)

5-22-3. Waste of water. It shall be a violation of these rules and regulations for any person, private corporation, public corporation, municipality, company, institution, township, county, state agency or federal agency to waste water as defined in these regulations. (Authorized by K.S.A. 1978 Supp. 82a-1028(o); effective May 1, 1979.)

5-22-4. Metering. (a) Each water flowmeter, gauge, or other measuring device required by the district shall meet the minimum specifications adopted by the chief engineer by regulation.

(b) The owner of the water right or approval of application shall perform the following:

(1) Ensure that the water flowmeter is properly installed in accordance with the specifications adopted by the chief engineer by regulation;

(2) maintain the water flowmeter in satisfactory working condition whenever the diversion works can reasonably be expected to operate; and

(3) ensure that the water flowmeter measures all of the discharge from the diversion works and does not measure any other discharge, including tailwater and sewage lagoon effluent. (Authorized by and implementing K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5; effective May 1, 1979; amended Oct. 15, 1990; amended Jan. 10, 2003.)

5-22-4a. Water flowmeter requirement. Each nondomestic, nontemporary well meeting any of the following conditions shall be equipped with a water flowmeter that meets or exceeds the requirements of K.A.R. 5-22-4:

(a) A well operated under the authority of an approval of application issued on or after September 1, 1987;

(b) a well operated under the approval of an application for change in the place of use, the point of diversion, or the use made of the water, or any combination of these, filed after September 1, 1987;

(c) a well that meets the standards for being a standby well as set forth in K.A.R. 5-22-1;

(d) a well for which a certificate of appropriation was issued on or after July 1, 1995; or

(e) a well for which the board determines it is necessary to have a water flowmeter to ensure any of the following:

(1) The accuracy of reported water use;

(2) compliance with the terms, conditions, and limitations of the water right, approval of application, or approval of change; or

(3) nonimpairment of other water rights. (Authorized by and implementing K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5; effective Jan. 10, 2003.)

5-22-4b. Water flowmeter maintenance. (a) If a water flowmeter required by the district is ever out of compliance, the owner shall promptly repair or replace the water flowmeter, or correct any problems with the installation.

(b) A water flowmeter shall be considered to be out of compliance if any of the following conditions is met:

(1) The water flowmeter registers less than 94 percent or more than 106 percent of the actual volume of water passing the water flowmeter. If necessary, this determination may be made by a field test conducted or approved by the chief engineer.

(2) The seal placed on the totalizer by the manufacturer or the manufacturer's authorized representative has been broken, or the totalizer value has been reset or altered without the authoriza-

tion of the manufacturer, an authorized representative of the manufacturer, or the chief engineer.

(3) A seal placed on the water flowmeter or totalizer by the chief engineer has been broken.

(4) The water flowmeter register is not clearly visible or is unreadable for any reason.

(5) There is not full pipe flow through the water flowmeter.

(6) The flow-straightening vanes have not been properly designed, manufactured, and installed.

(7) The water flowmeter is not calibrated for the nominal size of the pipe in which the flowmeter is installed.

(8) The water flowmeter is not installed in accordance with the manufacturer's installation specifications. However, five diameters of straight pipe above the water flowmeter sensor and two diameters below the water flowmeter sensor shall be deemed the minimum required spacing, regardless of the manufacturer's installation specifications.

(9) A water flowmeter is installed at a location where the flowmeter does not measure all of the water diverted from the source of supply. (Authorized by and implementing K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; effective Nov. 12, 2004.)

5-22-4c. Water flowmeter testing by a nondistrict person. If a water right owner desires to have a water flowmeter flow rate test performed by a person other than district staff to comply with any requirement of the district, that person may be approved by the board to perform a water flowmeter flow rate test if the person demonstrates to the district both of the following: (a) The person has the training, skills, and experience necessary to properly conduct the test.

(b) The person has the appropriate water flowmeter to perform the test, and the water flowmeter has been tested for accuracy with water flowmeter test equipment that has been found to be accurate using standards traceable to the national institute of standards and technology (NIST). The equipment shall have been tested and found to be accurate within 12 months of performing the water flowmeter test. (Authorized by and implementing K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; effective Nov. 12, 2004.)

5-22-4d. Water flowmeter installation procedures. (a) If installation of a water flowmeter is required by the board, the owner of the approval of application or the water right shall be notified of the requirement in writing.

(b) A water flowmeter shall be installed on a new or replacement point of diversion within 30 days after the point of diversion is operational, or before the diversion of water, whichever occurs first.

(c) A water flowmeter shall be installed on an existing point of diversion within 30 days of the issuance of the water flowmeter order by the district, or before the diversion of water, whichever occurs first.

(d) An extension of time to install the water flowmeter may be granted by the board if a request for an extension of time is filed with the district before the expiration of the time to install the water flowmeter and one of the following conditions is met:

(1) The water right owner has a contract with a vendor to install a water flowmeter, but the vendor cannot complete the installation within the time allowed.

(2) Weather, site conditions, or other conditions beyond the control of the owner prevent the water flowmeter from being installed within the time allowed.

(3) The owner demonstrates any other reason constituting good cause why the water flowmeter cannot be installed within the time allowed and that granting of an extension of time will not be adverse to the public interest.

(e) The water right owner shall notify the district within 30 days after the required water flowmeter is installed. The notification shall be submitted on a form prescribed by the district.

(f) An inspection of the water flowmeter installation may be made by the district to determine if the water flowmeter has been properly installed in accordance with the requirements of K.A.R. 5-22-4, K.A.R. 5-22-4a, and K.A.R. 5-22-4b.

(g) If an inspection is made by the district, the owner shall be notified by the district of the results of the inspection in writing. (Authorized by and implementing K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; effective Nov. 12, 2004.)

5-22-5. (Authorized by K.S.A. 82a-1028(o); implementing K.S.A. 82a-1028(n); effective May 1, 1980; amended Oct. 15, 1990; revoked Jan. 10, 2003.)

5-22-6. Noncompliance; penalties; appeal procedures. (a) Any person may file with the board a written or verbal complaint that some-

one is allegedly violating any regulation of the district, any provision of the Kansas water appropriation act, or a term, condition, or limitation of an approval of application or a water right.

(b) The alleged violation shall be investigated by the district staff.

(c) A written report of the investigation shall be prepared by the district staff.

(d) If the investigation determines that a violation of a regulation of the district has occurred, an order shall be issued by the board or its designee. The order shall specify the following:

(1) What the violation of the regulation is;

(2) what actions are necessary to correct the violation;

(3) what a reasonable time is for correcting the violation. Extensions of time to correct a violation may be granted by the board if good cause is shown by the violator or owner;

(4) that the order will become effective immediately; and

(5) that a hearing may be requested within 15 days of the issuance of the order. The request for a hearing may include a request for a stay of the order. If the person shows good cause why a stay should be granted, a stay may be granted by the board.

(e) The owner or owners of the approval of application or water right, as shown in the records of the district, shall initially be notified of the violation verbally, in writing, or by other means. Regardless of the means of initial notification, a copy of the order shall also be served by delivering a copy of the order in person or by restricted mail.

(f) The record of the complaint, the investigation, and the notice of violation shall be made a part of the official records of the district.

(g) If the violation is corrected by the deadline specified by the board, the violator shall notify the district staff. An inspection shall be conducted by the district staff to determine if the violation has been corrected. If the violation has been corrected, the diversion of water may continue within the terms, conditions, and limitations of the approval of application or water right.

(h) If the violation is not corrected by the deadline specified by the board, an order requiring that unauthorized or illegal diversion of water cease until the violation is corrected shall be issued by the district.

(i) If the violator ceases diversion of water and then corrects the violation, the violator shall notify the district when the violation is corrected. The diversion works and the authorized place of use, as appropriate, shall be inspected by the district staff to determine whether the violation has been corrected. If the board determines that the violation has been corrected, the order prohibiting the diversion of water shall be rescinded by the board. When the owner or violator receives notice from the district that the order prohibiting the diversion of water has been rescinded, the diversion of water may recommence.

(j) If the violator performs any act described in subsection (a), any of the following actions may be taken by the board:

(1) If applicable, bring an injunctive action to enforce the order of the district;

(2) if applicable, request enforcement assistance from the chief engineer;

(3) if applicable, request that criminal proceedings be brought pursuant to K.S.A. 82a-728, and amendments thereto;

(4) if applicable, request that the county attorney or district attorney initiate injunctive remedies pursuant to K.S.A. 68-184, and amendments thereto, to prevent the occurrence of a nuisance;

(5) enter into a consent order with the violator specifying the remedial actions that shall be taken by the violator;

(6) require the installation of a water flowmeter;

(7) take any other legally permissible enforcement action; or

(8) any combination of the actions specified in paragraphs (j)(1) through (7).

(k) After the violator has been issued an order as specified in subsection (d), the violator, or anyone whose legal rights, duties, privileges, immunities, or other legal interests could be affected by the order, may appeal the order to the board. The appeal shall be filed within 15 days of the issuance of the order.

(l) The appeal petition shall state the basis for the appeal and shall be accompanied by documentation supporting the appeal.

(m) During the appeal, any relevant information or data may be considered by the board, including relevant data and information submitted by any person whose legal rights, duties, privileges, immunities, or other legal interests could be affected by the order.

(n) After consideration of the appeal, one of the following actions shall be taken by the board:

(1) Remand the matter to the district staff with instructions for additional investigation; or

(2) notify the violator and the chief engineer of

the board's final decision. The violator and all other parties shall be notified of the board's decision by certified mail.

(o)(1) Within 15 days after the service of the board's decision on the violator and any other affected party, the violator or any other affected party may file with the board a written request for reconsideration, which shall state the specific grounds for the request for reconsideration. The petition for reconsideration shall be deemed denied if not acted on by the board within 30 days.

(2) If the request for reconsideration is granted by the board, an administrative hearing shall be held by the board within 30 days of the date on which the request is filed with the board. After the hearing, the board may affirm, reverse all or part of, or modify the order of the board. (Authorized by and implementing K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; effective May 1, 1980; amended Dec. 10, 2004.)

5-22-7. Safe yield. (a) Except as set forth in subsection (b), the approval of each application for a change in the point of diversion, term permit, and permit to appropriate water for beneficial use shall be subject to the following requirements:

(1) The sum of prior appropriations, including the proposed application, vested rights, appropriation rights, term permits and earlier priority applications and baseflow nodes, shall not exceed the allowable safe-yield amount for the area of consideration. The non-consumptive use of groundwater previously authorized by the chief engineer shall be excluded from the sum of prior appropriations.

(2) The quantity authorized on all prior permits, certificates, and vested rights, the quantity requested on prior applications, and the quantities allocated to baseflow nodes shall be used to calculate the sum of prior appropriations and baseflow allocations.

(3) All conditions and limitation clauses listed on all prior appropriations and applications in the area of consideration shall be considered in effect.

(4) The baseflow allocation for baseflow nodes shall be calculated using the formula Qa = T/N where:

(A) Qa is the baseflow allocation per baseflow node in acre-feet per year;

(B) T is the total baseflow allocation for a reach of a stream in acre-feet per calendar year. T is the average of the 12 calendar months' daily flow values in cubic feet per second that were equaled or exceeded 90 percent of the time during a specifically designated hydrologically significant period of record, times a factor of 724; and

(C) N is the number of baseflow nodes established on a stream or reach of a stream. Nodes are located at the upstream end of the watercourse reach and thereafter at the intersection of the channel of a watercourse and an arc of a 1,320 foot-radius circle whose center is located on the previously established baseflow node.

(5) The allowable safe-yield amount shall be calculated using the formula $S = A \times K$ where:

(A) S is the allowable safe-yield amount in acre-feet per year;

(B) A is the area of consideration; and

(C) K is an aquifer recharge value in feet. Everywhere in the district, except in McPherson county, K is equal to 0.5 feet per year. In McPherson county, K is a constant equaling 0.25 feet per year. K is calculated by multiplying the recharge percentage, which is 10 percent in McPherson county and 20 percent for the rest of the district, times the average annual precipitation of 2.5 feet per year.

(6) When evaluating an application for a change in the point of diversion, each application with a priority earlier than the priority established by the filing of the application of change shall be included in the safe-yield analysis.

(7) If the perimeter of the area under consideration intersects a group of wells authorized under prior applications, permits, certificates, or vested rights, a reasonable quantity of water shall be assigned to each well based upon the best available information.

(b) The following shall not be subject to this regulation:

(1) An application to appropriate groundwater in an area not closed by regulation or intensive groundwater use control area order by the chief engineer to new non-domestic, non-temporary permits and term permits for five or fewer years, if all of the following conditions are met:

(A) The annual quantity of water requested in the application does not exceed 15 acre-feet;

(B) the sum of the annual quantity of water requested in the application and the total annual quantities of water authorized by prior approvals of applications allowed because of an exemption pursuant to this regulation does not exceed 45 acre-feet in a two-mile-radius circle surrounding the proposed point of diversion;

(C) the approval of the application does not au-

thorize an additional quantity of water out of an existing authorized point of diversion with a nondomestic approval of application or water right that would then authorize a total combined annual quantity of water from that point of diversion in excess of 15 acre-feet;

(D) the application complies with the well spacing criteria in K.A.R. 5-22-2; and

(E) the application complies with all other applicable regulations in effect when the application is filed;

(2) an application for a non-consumptive use of groundwater;

(3) an application for change in point of diversion, if the diversion works were completed:

(A) 300 feet or less from the originally authorized point of diversion;

(B) within 150 feet of the location approved by the chief engineer; and

(C) a notice of completion was timely filed with the chief engineer under the original approval of application;

(4) an application requesting only an additional rate of diversion on an existing well, if the approval of the application:

(A) Is limited to the maximum annual quantity of water authorized by a prior certified, vested, or appropriation right; and

(B) contains both of the following conditions:

(i) The approved application for additional rate shall be dismissed if the prior certified, vested, or appropriation right is dismissed and terminated; and

(ii) the approved or certified maximum annual quantity of water shall be reduced in an amount equal to any subsequent reduction in the maximum annual quantity of water authorized by the prior certified, vested, or appropriation right;

(5) an application for a standby well;

(6) an application for a bank storage well only to the extent that the bank storage well is withdrawing bank storage water; and

(7) an application for an aquifer storage and recovery well. (Authorized by and implementing K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; effective May 1, 1983; amended Oct. 15, 1990; amended March 7, 1994; amended Nov. 12, 2004.)

5-22-8. Change applications. (a) Except as set forth in subsection (d), the approval of each application for a change in point of diversion for a vested right, appropriation right, permit, term permit, or an application to appropriate groundwater shall be subject to the following requirements:

(1) The maximum distance a replacement well can be located from the originally authorized location shall be 2,640 feet.

(2) A replacement well located more than 300 feet from the currently authorized location shall comply with the provisions of K.A.R. 5-22-2.

(3) An application for a change in point of diversion shall be accompanied by either a completed abandoned-well or inactive-well agreement if the original well will no longer be authorized by any other vested right, appropriation right, approval of application, or term permit and the well has not been properly physically adapted for, and actually used for, domestic use. The completed agreement shall be submitted by the applicant with the application for a change in point of diversion on a form prescribed by the district.

(4) Each point of diversion described in the application shall be equipped with a water flowmeter that meets or exceeds the criteria of K.A.R. 5-22-4, K.A.R. 5-22-4a, K.A.R. 5-22-4b, and K.A.R. 5-22-4d.

(b) The approval of each application for a change in place of use or the use made of water for a vested right, appropriation right, approval of application, and term permit shall have a condition that a water flowmeter that meets or exceeds the requirements of K.A.R. 5-22-4, K.A.R. 5-22-4a, K.A.R. 5-22-4b, and K.A.R. 5-22-4d be installed on each point of diversion described in the application.

(c) Except as specified in subsection (d), each approval of application for a change in place of use for irrigation purposes shall be subject to the following requirements:

(1) If the time to perfect the water right has expired, the water right shall be certified before the change application may be approved.

(2) The approval of the application for change in place of use shall not authorize an increase in the size of the authorized place of use in excess of the limits specified in K.A.R. 5-5-11(b).

(d) An application for change in place of use for irrigation purposes filed only for the purpose of creating an identical place of use with another water right or rights shall not be subject to subsection (c) if all of the following conditions are met:

(1) There is not a net increase in the number of authorized acres.

(2) Each water right involved in the proposed

identical overlap in place of use is certified by the chief engineer before processing the change application if approval of the change application would authorize an increase in base acreage as defined in K.A.R. 5-5-11(a).

(3) The total quantity authorized by all existing water rights and all permits involved is reasonable to irrigate the land authorized after the change in place of use is approved. (Authorized by and implementing K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; effective Oct. 15, 1990; amended March 7, 1994; amended Nov. 12, 2004.)

5-22-9. Exceptions. Each recommendation timely submitted by the district concerning an exemption from, or waiver to, a regulation adopted by the chief engineer shall be considered by the chief engineer. An exception to these regulations may be granted by the chief engineer if the applicant demonstrates that the exception will neither impair a use under an existing right nor prejudicially affect the public interest. (Authorized by K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; effective Oct. 15, 1990; amended Nov. 12, 2004.)

5-22-10. Aquifer storage and recovery system: data reporting requirements. (a) Each person operating an aquifer storage and recovery system of which all or part of is within the boundaries of the district shall file an annual report with the district no later than June 1 for the previous calendar year. The report shall contain the water balance in the basin storage area and, in addition to the information required by K.A.R. 5-12-2, information about the following, as specified:

(1) Source water:

(A) The type;

(B) the quantity of water available;

(C) the quantity of water surface water and bank storage water diverted;

(D) the basin storage loss; and

(E) the chemical, physical, radiological, and biological quality for each type of source water diverted;

(2) aquifer storage:

(A) The artificial recharge techniques used;

(B) the quantity of source water recharged by each technique used;

(C) the total quantity of source water stored in the basin storage area; and

(D) the chemical, physical, radiological, and biological quality for each type of water stored;

(3) recovery of stored water:

(A) A monthly and annual summary of recharge credits withdrawn from each recovery well; and

(B) the chemical, physical, radiological, and biological quality of the water recovered; and

(4) hydrologic conditions:

(A) The quarterly index water levels;

(B) the key groundwater quality parameters;

(C) the monthly and annual precipitation quantities;

(D) the annual groundwater withdrawals from all wells except domestic wells;

(E) the annual streamflow, including baseflows and above-baseflow stage;

(F) a summary of the conjunctive use amounts; and

(G) the water supply and demand forecast for the next three years.

(b) The operator of the aquifer storage and recovery system shall furnish the district with whatever analyses, data, and other supporting documentation are necessary to understand and verify the report.

(c) The board shall review the report and submit its findings and recommendations to the chief engineer regarding the report no later than September 1 of the calendar year in which the report is required to be filed. (Authorized by and implementing K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; effective Dec. 10, 2004.)

5-22-12. Application processing requirements and procedures. (a) Except as provided in subsection (c), each application for any of the following shall be subject to the requirements and procedures in subsection (b):

(1) Appropriate water for beneficial use;

(2) change the point of diversion, the use made of water, the place of use, or any combination of these; or

(3) obtain a term permit.

(b)(1) Before final action is taken on an application, a copy of the application shall be submitted by the chief engineer to the district for review and recommendation.

(2) The district staff shall conduct a review of the proposed application. The district staff's recommendation to the chief engineer shall be consistent with the provisions of the Kansas water appropriation act, the groundwater management district act, and the regulations adopted by the chief engineer pursuant to those acts.

(3) Within 15 working days after the date the

chief engineer submits the application to the district for review, or any extension of time approved by the chief engineer, the district staff shall submit to the chief engineer its findings and recommendation for approval, denial, or modification of the application and shall specify the basis for the recommendation. At the same time the district submits its recommendation to the chief engineer, the recommendation shall also be served on the applicant and any other parties to the proceedings.

(4) A district staff's findings and recommendation concerning an application may be appealed to the board by the applicant or anyone whose legal rights, duties, privileges, immunities, or other legal interests may be affected by approval, denial, or modification of the application.

(5) The petition for review by the board shall be filed by the party appealing the recommendation with the board within 30 days after the date of the letter sending the findings and recommendations by the staff of the district to the applicant or other party. The petition shall state the basis for the appeal and shall be accompanied by documentation supporting the appeal.

(6) During the appeal, any relevant information or data may be considered by the board, including relevant data and information submitted by a person whose legal rights, duties, privileges, immunities, or other legal interests may be affected by approval, denial, or modification of the application.

(7) After consideration of the appeal, one of the following actions shall be taken by the board:

(A) Remanding the matter to the district staff with instructions for additional investigation; or

(B) notifying the applicant and the chief engineer of the board's final recommendation. The applicant and all other parties shall be notified of the board's decision by certified mail.

(8) Within 15 days after the service of the board's decision on the applicant and any other party, the applicant or any other party may file with the board a written request for reconsideration, which shall state the specific grounds for the request for reconsideration. The petition for reconsideration shall be deemed denied if not acted on by the board within 30 days.

(c) The following shall not be subject to this regulation:

(1) The domestic use of water;

(2) an application for a temporary permit; and

(3) an application to change the point of diversion if both of the following conditions are met:

(A) The point of diversion is proposed to be moved less than 300 feet; and

(B) the point of diversion is not a battery. (Authorized by and implementing K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5; effective Jan. 10, 2003.)

5-22-13. Potential net evaporation. (a) The map titled "annual potential net evaporation in inches for Equus Beds groundwater management district no. 2 (annual average evaporation minus annual normal precipitation)," prepared by the district and dated June 11, 2002, is hereby adopted by reference for the purpose of determining potential net evaporation from a free-water surface within the district.

(b) The values on the map shall be used in all situations in which the determination of potential net evaporation from a free-water surface is necessary, including the following:

(1) Computing the annual amount of evaporation that will be caused by exposing the groundwater table;

(2) calculating the quantity of surface water that is reasonably expected to be replaced with groundwater pumped under an approval of application or water right;

(3) calculating the average annual evaporation from groundwater that will be used to determine annual water use; and

(4) determining the maximum annual quantity of water that is perfected pursuant to K.S.A. 82a-714, and amendments thereto.

(c) The values shown on the map shall be used unless the applicant provides, or the chief engineer or the district has available, better or more site-specific data concerning potential net evaporation. (Authorized by and implementing K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; effective Dec. 10, 2004.)

5-22-14. Maximum reasonable quantity for beneficial use. (a) The maximum annual quantity of water deemed reasonable for irrigation use shall be the following:

(1) 1.3 acre-feet per acre in Harvey, McPherson, and Sedgwick counties; and

(2) 1.4 acre-feet per acre in Reno county.

(b) The following quantities shall be used to determine the maximum annual quantity of water deemed reasonable for nondomestic livestock and poultry use:

Livestock or poultry	Drinking water (gallons per day)	Units
Cattle, beef	15	per head
Cattle, dairy	35	per head
Swine finishing nursery sow and litter gestating sow	 5 1 8 6	per head
Sheep	2	per head
Horses	12	per head
Poultry chickens turkeys	 9 30	 100 layers 100 turkeys
Calves (750 pounds or less)	10	per head
Goats	9	per head

(c) The maximum reasonable quantity of water that may be approved for nondomestic livestock and poultry use for applications approved on or after the effective date of this regulation shall be limited as specified in subsection (b), unless the applicant demonstrates with adequate supporting information that the quantity of water and rate of diversion requested meet the following conditions:

(1) Are reasonable for the intended use;

(2) are not wasteful; and

(3) will not otherwise prejudicially and unreasonably affect the public interest.

(d) For all other types of nondomestic livestock, poultry, birds, and animals, the maximum quantity of water approved for beneficial use shall be reasonable. The applicant shall justify the quantity of water requested with information on peer water use, the historical measured usage, a professional recommendation, or any other relevant information.

(e) Each applicant who seeks to appropriate water for industrial use shall submit information to demonstrate that the annual quantity of water requested is reasonable for that particular type of industrial use. The information submitted shall include the quantity of water reasonable for that type of industrial use based on current industry standards and a use of technology that is economically and technically feasible for that industry at that location.

(f) Unless the applicant demonstrates a projected deviation from actual population trends, a reasonable annual quantity of water for municipal use shall not exceed the lessor of either of the following:

(1) 200 gallons per capita per day; or

(2) 110 percent of the last three years' average per capita per day usage, excluding industries that use over 200,000 gallons per year, times 365 days per year, times the projected population for the twentieth year after the application is filed, plus reasonable projected water use for industries that use over 200,000 gallons per year. Population projections shall be made using one of the following:

(A) Accepted statistical methods using historic population trends for the applicant; or

(B) data from the U.S. census bureau, Kansas water office population projections, or the Kansas census bureau. Projected deviations from historic population trends shall be justified by the applicant.

(g) The maximum annual quantity of water deemed reasonable to be provided from a well to a pond, lake, or reservoir that does not expose the current or historical water table shall be calculated using the formula $Q_c = [(E+S)/12] \times A_{sw} + F$ where:

(1) Q_c is the maximum quantity of water use in acre-feet;

(2) E is the potential net evaporation in inches per year;

(3) S is the seepage loss based on soil and subsoil in inches per year;

(4) A_{sw} is the surface area of the pond in acres as measured at the elevation of the lowest uncontrolled spillway; and

(5) F is the quantity of water in acre-feet necessary to fill the pond initially.

(h) The maximum annual quantity of water deemed reasonable to replace the evaporation from a groundwater pit shall be calculated using the formula $Q_c = (E/12) \times A_{wt}$ where:

(1) Q_c is the maximum annual quantity of evaporation of groundwater from the pit in acre-feet;

(2) E is the potential net evaporation in inches per year; and

(3) A_{wt} is the area of the water table exposed in the groundwater pit expressed in acres. (Authorized by and implementing K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; effective Dec. 10, 2004.)

5-22-15. Limitations on the use of fresh groundwater. (a) Fresh groundwater shall not be used for any of the following purposes, unless the

applicant demonstrates before approval of the application that the use of other waters is not technologically or economically feasible:

(1) The enhanced recovery of oil or gas;

(2) solution mining;

(3) the construction of storage caverns in subsurface salt deposits;

(4) the displacement and extraction of hydrocarbons from subsurface storage;

(5) any use that is not a beneficial use, as defined in K.A.R. 5-1-1; and

(6) any use that is not in the public interest.

(b) "Other waters" shall include the following:

(1) Water having a chloride content of more than 500 milligrams per liter (mg/l);

(2) water that is otherwise contaminated so that it is not drinkable;

(3) renewable surface water; and

(4) water that is being reclaimed, recycled, or reused. (Authorized by K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; implementing K.S.A. 82a-706a, K.S.A. 2003 Supp. 82a-711, and K.S.A. 2003 Supp. 82a-1028; effective Dec. 10, 2004.)

5-22-17. Bank storage wells. (a) Each applicant for one or more bank storage wells shall demonstrate all of the following:

(1) The hydraulic connection from the streambed and banks to each bank storage well screen is sufficient to transmit bank storage water from the bed and banks of the stream to each bank storage well screen at a rate sufficient to sustain the authorized rate of diversion of the well or wells.

(2) Within seven days after the pumping of all bank storage wells has ceased, the water level in each bank storage well, or a monitoring well located within 100 feet of that bank storage well, will recover to an elevation equal to or greater than the water level elevation immediately before the bank storage well began to pump, adjusted for any regional groundwater level changes not caused by the pumping of the bank storage well.

(3) The naturally occurring and artificially induced rate of infiltration from the bed and banks of the stream when bank storage is occurring will be sufficient to meet the following conditions:

(A) Equal or exceed the authorized rate of diversion of all of the bank storage wells;

(B) prevent impairment caused by all bank storage wells; and

(C) prevent groundwater mining caused by all bank storage wells.

(b) If an application for a bank storage well is approved by the chief engineer, the applicant shall install one or more water-level measurement tubes at locations that will allow adequate monitoring of groundwater quality and groundwater levels within the area where the annual cone of depression of the bank storage well or wells could be greater than 0.5 feet. Each water-level measurement tube shall be constructed and maintained in accordance with K.A.R. 5-6-13. (Authorized by K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2003 Supp. 82a-1028; effective Nov. 12, 2004.)

Article 23.—SOUTHWEST KANSAS GROUNDWATER MANAGEMENT DISTRICT NO. 3

5-23-1. Definitions. As used in these regulations, by the southwest Kansas groundwater management district in the implementation of the groundwater management district act, and by the division of water resources in the administration of the Kansas water appropriation act and the groundwater management district act, unless the context clearly requires otherwise, the following words and phrases shall have the meanings ascribed to them in this regulation. (a) "Confined aquifer" means an aquifer overlain and underlain by impermeable layers. Groundwater in a confined aquifer is normally under pressure greater than atmospheric pressure.

(b) "High plains aquifer" means the aquifer comprised of the undifferentiated Pleistocene-age deposits, Quaternary loess, alluvium, dune sand, the Ogallala formation, and deeper aquifers that are in vertical or horizontal hydraulic contact with the Ogallala formation.

(c) "Hydraulic contact" means the absence of an impermeable layer between aquifers.

(d) "Theis analysis" means the Theis non-equilibrium equation analysis described in pp. 108-113 in "ground water and wells: a reference book for the water-well industry," published in 1966 by Edward E. Johnson, Inc. The pages specified in this subsection are hereby adopted by reference.

(e) "Unconfined aquifer" means an aquifer in which the groundwater is exposed to the atmosphere through openings in the overlying materials. The upper surface of an unconfined aquifer is the water table.

(f) "Well" means any artificial excavation that is

drilled, cored, bored, washed, driven, dug, or otherwise constructed when the intended use of the excavation is for the acquisition, diversion, or artificial recharge of groundwater. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028(o); implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1981; amended May 1, 1985; amended Sept. 22, 2000; amended Feb. 27, 2004.)

5-23-2. Tailwater control and waste. No water user shall allow waste of water. If the water is re-used, the user shall apply the water consistent with the approved application to appropriate water for beneficial use, vested right or appropriation right. All water users shall construct and operate the water distribution systems in a manner as to prevent the waste of water, and shall do everything necessary and proper to preserve the quality of the groundwater resources within the district. (Authorized by K.S.A. 1980 Supp. 82a-1028(o); implementing K.S.A. 1980 Supp. 82a-1028(n); effective May 1, 1981.)

5-23-3. Minimum well spacing requirements: high plains aquifer. (a) (1) The minimum horizontal distance between each proposed nontemporary, nondomestic well and all other senior nontemporary, nondomestic wells diverting water from the high plains aquifer shall be determined from the following schedule.

Quantity per well (acre-feet per year)	Minimum well spacing requirement
15 or less	660 feet
16 - 200	1,300 feet
201 - 300	1,600 feet
301 - 400	1,900 feet
401 - 500	2,100 feet
more than 500	2,300 feet

(2) The minimum well spacing requirement shall be based on the maximum annual quantity of water. The required well spacing shall be the greater of either of the following:

(A) The minimum spacing for the total authorized and requested quantity of water for the proposed well; or

(B) the total authorized and requested annual quantity of water for the nontemporary, nondomestic well against which the spacing is being measured that is senior to the date on which the application was filed. If the quantity of water applied for includes a fraction of an acre-foot, the quantity of water shall be rounded down to the next whole number of acre-feet for the purpose of applying the table in this subsection.

(b) The location of a well or wells on an application for approval to change the point of diversion under an existing water right shall be no more than 2,640 feet from the currently authorized and completed point of diversion.

(c) A well shall be exempt from the minimum well spacing requirements of this regulation if the well meets either of the following conditions:

(1) The well is being replaced within 300 feet of the currently authorized point of diversion.

(2) The proposed replacement well location improves the spacing to all other wells for which the spacing requirement was not met on the date on which the application for a change in point of diversion was filed and continues to meet requirements for spacing to all wells for which the spacing requirement was met at the time the application for change in point of diversion was filed.

(d) No application for approval to change the point of diversion under an approved application for which the original well has not been drilled shall be approved if the location of the proposed point of diversion decreases the distance from the approved location to any other existing wells to less than the spacing requirement for new applications.

(e) Each nondomestic, nontemporary well shall be located a minimum of 660 feet from all domestic wells with a priority earlier than the date on which the change application was filed, unless all of the following conditions are met:

(1) The domestic well is owned by the applicant.

(2) The applicant signs a written request to waive the requirements for spacing to the domestic well.

(3) The applicant submits information documenting the location and depth of the domestic well and any other information necessary for the chief engineer to determine whether the domestic well is likely to be impaired.

(4) A Theis analysis or other hydraulic analysis shows that the domestic well is not likely to be impaired by the proposed well.

(f) In the case of a battery of wells, as defined in K.A.R. 5-1-1, the minimum horizontal distance shall be measured from the geographic center of the wells comprising the battery.

(g) The total annual quantity per well shall be the sum of all of the quantities authorized or requested by any water rights, permits, or applica-

tions requesting or authorizing that well as a point of diversion. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a, K.S.A. 2002 Supp. 82a-711, K.S.A. 2002 Supp. 82a-708b, and K.S.A. 82a-1028; effective May 1, 1981; amended May 1, 1985; amended Aug. 28, 1989; amended Sept. 30, 1991; amended Sept. 22, 2000; amended Feb. 27, 2004.)

5-23-3a. Minimum well spacing requirements: confined aquifers. (a)(1) The minimum horizontal distance between each proposed nontemporary, nondomestic well and all other senior nontemporary, nondomestic wells diverting water from a confined aquifer shall be determined from the following schedule.

Quantity per well (acre-feet per year)	Minimum well spacing requirement	Required distance from hydraulic contact point
15 or less	660 feet	2,640 feet
16 to 25	2,300 feet	1 mile
26 to 100	5,280 feet	2 miles
More than 100	10,560 feet	5 miles

(2) The minimum well spacing requirement shall be based on the authorized maximum annual quantity of water. The well spacing requirement shall be the greater of either of the following:

(A) The minimum spacing for the total authorized and requested annual quantity of water of the proposed well; or

(B) the total authorized and requested quantity of water for nontemporary, nondomestic well against which spacing is being measured that is senior to the date on which the application was filed.

The total annual quantity of water per well shall be the sum of all of the quantities authorized or requested by any water rights, approvals of applications, or applications requesting or authorizing that well as a point of diversion.

If the quantity of water applied for includes a fraction of an acre-foot, the quantity of water shall be rounded down to the next whole number of acre-feet for the purpose of applying the table in this subsection.

(b) In the case of a battery of wells, as defined in K.A.R. 5-1-1, the minimum horizontal distance shall be measured from the geographic center of the wells comprising the battery.

(c) A well penetrating both a confined and unconfined aquifer shall be constructed to prevent the vertical migration of water between the aquifers. A well diverting water from the Dakota aquifer system shall be constructed to prevent the vertical migration of water between the Dakota aquifer system and all other freshwater aquifers.

(d) The location of a well or wells on an application for approval to change the point of diversion under an existing water right shall be no more than 2,640 feet from the currently authorized and completed point of diversion.

(e) A well shall be exempt from the minimum well spacing requirements of this regulation if the well meets either of the following conditions:

(1) The well is being replaced within 300 feet of the currently authorized point of diversion.

(2) The proposed replacement well location improves the spacing to all other wells for which the spacing requirement was not met on the date on which the application for a change in point of diversion was filed and continues to meet requirements for spacing to all wells for which the spacing requirement was met at the time the application for change in point of diversion was filed.

(f) No application for approval to change the point of diversion under an approval of application for which the original well has not been drilled shall be approved if the location of the proposed point of diversion decreases the distance from the approved location to any other existing wells to less than the spacing requirements for a new application.

(g) Each nondomestic, nontemporary well shall be located a minimum of 1,320 feet from all domestic wells in the same or a hydraulically connected aquifer with a priority earlier than the date on which the change application was filed, unless all of the following conditions are met:

(1) The domestic well is owned by the applicant.

(2) The applicant signs a written request to waive the requirements for spacing to the domestic well.

(3) The applicant submits information documenting the location and depth of the domestic well and any other information necessary for the chief engineer to determine whether the domestic well is likely to be impaired.

(4) A Theis analysis or other hydraulic analysis shows that the domestic well is not likely to be impaired by the proposed well.

(h) The minimum horizontal distance between a nontemporary, nondomestic well withdrawing water from a confined aquifer and a well withdrawing water from an unconfined aquifer shall

be 660 feet. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a, K.S.A. 2002 Supp. 82a-711, K.S.A. 2002 Supp. 82a-708b, and K.S.A. 2002 Supp. 82a-1028; effective Sept. 22, 2000; amended Feb. 27, 2004.)

5-23-4. Safe yield: high plains aquifer. (a) Except as set forth in subsection (b), the approval of all applications for a permit to appropriate water from the high plains aquifer, and the approval of all applications for a change in the point of diversion if the diversion works have not been completed under the original approved application, shall be processed in accordance with K.A.R. 5-3-9, K.A.R. 5-3-10, and K.A.R. 5-3-11. For the purpose of applying K.A.R. 5-3-11 (d)(3) within the boundaries of the district, the percentages of the calculated recharge that shall be considered to be available for appropriation shall be determined using the following table:

Percent of Calculated Recharge Available for Appropriation	River Basin
(A) 75 %	Arkansas
(B) 75 %	Cimarron River
(C) 75 %	Crooked Creek
(D) 75 %	North Fork Cimaron River

(b) This regulation shall not apply to the following:

(1) Wells for domestic use;

(2) wells authorized by temporary permits;

(3) wells authorized by term permits of fewer than five years;

(4) an application to appropriate 15 acre-feet of water or less if all of the following conditions are met:

(A) The safe yield has been exceeded, but the sum of the annual quantity requested by the proposed appropriation and the total quantities authorized by prior permits because of this exemption does not exceed 15 acre-feet in a circle with a radius of ½ mile surrounding the proposed point of diversion.

(B) Well spacing criteria have been met.

(C) Approval of the application will not authorize an additional quantity of water out of an existing well authorized by a nondomestic approval of application or water right, which would result in a total combined annual quantity of water authorized from that well in excess of 15 acre-feet.

(D) All other criteria for processing a new application have been met.

(c) Each application filed to request a well within the area described in subsection (e) shall include a driller's log, an electric log, and a laboratory analysis from a state-certified laboratory of the chloride concentrations in samples taken from whatever depths are necessary to determine the vertical location where the chloride concentrations exceed 250 milligrams per liter (mg/l). The samples shall be taken from a well located within a 300-foot radius of the proposed well. A state-certified laboratory analysis shall be used to determine the vertical location of the chloride concentrations exceeding 250 mg/l.

(d) Each well constructed in the area described in subsection (e) shall be constructed in a manner that prevents the movement of water containing 250 mg/l of chlorides beyond its naturally occurring condition.

(e) The level of chlorides may exceed 250 mg/l in the following areas:

(1) The west ½ of townships 33, 34, and 35 south, range 28 west in Meade County, Kansas;

(2) the east ½ of township 33 south, range 29 west in Meade County, Kansas;

(3) all of townships 34 and 35 south, ranges 29 and 30 west in Meade County, Kansas; and

(4) all of townships 34 and 35 south, ranges 31 and 32 west and the east ½ of townships 34 and 35 south, range 33 west in Seward County, Kansas. (Authorized by K.S.A. 82a-706a and 82a-1028; implementing K.S.A. 82a-706a, K.S.A. 2002 Supp. 82a-711, and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1981; amended May 1, 1986; amended Aug. 28, 1989; amended Sept. 22, 2000; amended Nov. 21, 2003.)

5-23-4a. Criteria for closing townships to new appropriations. (a) Entire townships shall be closed to further appropriation of water for beneficial use from the high plains aquifer if at least one of the following conditions exists:

(1) The entire township is fully appropriated.

(A) A township shall be considered to be fully appropriated if the aquifer within the township would be depleted by 40 percent or more in 25 years if current vested rights and appropriations are fully exercised and all limitation clauses listed on permits to appropriate water and certificates are in force.

(B) Aquifer depletion shall be calculated using the allowable annual appropriation formula de-

scribed in subsection (b) with the area of consideration equal to the number of acres within sections of land containing saturated thickness within the township.

(2) The average saturated thickness of the aquifer within the township is 50 feet or less, as set forth in K.A.R. 5-23-15.

(3) The aquifer has been depleted by 20 percent or more since 1950. Depletion since 1950 shall be determined from maps or data, or both, recommended by the board and adopted by the chief engineer by regulation.

(4) Groundwater pumping has lowered the water level of the high plains aquifer, which has diminished the baseflow from the aquifer to the stream and impaired senior domestic surface water rights and other senior surface water rights.

(5) Groundwater pumping in an area has lowered the water level of the freshwater to the point that the issuance of additional approvals of applications will induce water in excess of 250 milligrams per liter chlorides to mix with overlying freshwater, causing contamination of the overlying freshwater.

(b) Except for the types of wells listed in subsection (c), the proposed appropriation, when added to the vested rights, prior appropriation rights, and earlier priority applications, shall not exceed, in 25 years, a calculated rate of depletion of 40 percent of the saturated thickness underlying the area of consideration. For the purpose of analysis, all vested rights, appropriation rights, approvals of applications, and prior unapproved applications shall be considered to be fully exercised, and all limitation clauses on approvals of application and certificates shall be considered to be in force. The allowable annual appropriation shall be calculated using the following formula:

$$\text{Allowable Aquifer Yield} = \frac{0.40AMS}{25} + \frac{AR}{12}$$

Allowable aquifer yield = the amount of water, measured in acre-feet, available annually for appropriation from a proposed point of diversion (well).

A = the "area of consideration" shall be equal to the number of acres within sections containing saturated thickness within the township and within the district.

M = the number of feet of average saturated thickness of the high plains aquifer within the township as set forth in K.A.R. 5-23-15.

S = the storage coefficient or a specific yield of 15 percent.

R = average annual recharge and return flow, which shall be one inch per year.

(c) The calculation specified in subsection (b) shall not include the following types of wells:

(1) Wells for domestic use;

(2) wells authorized by temporary permits; and

(3) wells authorized by term permits of fewer than five years. (Authorized by K.S.A. 82a-706a and 82a-1028(o); implementing K.S.A. 82a-1028(n); effective Sept. 30, 1991; amended Sept. 22, 2000; amended Nov. 21, 2003.)

5-23-4b. Township closures. (a) The following townships have been determined to meet the criteria in K.A.R. 5-23-4a for closing a township to new appropriations of water from the high plains aquifer; therefore, no new appropriations of water shall be allowed from the high plains aquifer in the following townships, except as described in subsection (b):

(b) The closure of the townships to new appropriations of water from the high plains aquifer as listed in subsection (a) shall not apply to the following:

(1) Wells for domestic use;

(2) wells authorized by temporary permits;

(3) wells authorized by term permits of fewer than five years; and

(4) wells authorized by an application to appropriate 15 acre-feet of water or less if the following conditions are met:

(A) The allowable aquifer yield has been exceeded, but the sum of the annual quantity requested by the proposed appropriation and the total quantities authorized by prior permits because of this exemption does not exceed 15 acre-feet in a radius of ½ mile surrounding the proposed point of diversion.

(B) Well spacing criteria have been met.

(C) Approval of the application will not authorize an additional quantity of water out of an existing well authorized by a nondomestic approval of application or water right that would result in a total combined annual quantity of water authorized from that well in excess of 15 acre-feet.

(D) All other criteria for processing a new application have been met. (Authorized by K.S.A. 82a-706a and K.S.A. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective Sept. 22, 2000; amended Nov. 21, 2003.)

5-23-5. (Authorized by K.S.A. 1980 Supp. 82a-1028(o); implementing K.S.A. 1980 Supp. 82a-1028(n); effective May 1, 1981; revoked Nov. 21, 2003.)

5-23-6. Water-measuring devices. The

diversion works for each nontemporary, nondomestic well located within the boundaries of the district shall be equipped with a water flowmeter that meets or exceeds the specifications in K.A.R. 5-1-4 through 5-1-12.

(a) The owner shall perform the following:

(1) Ensure that the water flowmeter is installed according to specifications in K.A.R. 5-1-4 through 5-1-12;

(2) maintain the water flowmeter in proper working condition whenever the diversion of water for nondomestic use can reasonably be expected to occur; and

(3) promptly initiate action to repair or replace any water flowmeter that is out of compliance, and correct any problems with the installation of a water flowmeter.

(b) The owner shall notify the district, on a form prescribed by the district, within 30 days after any of the following:

(1) A new water flowmeter is installed.

(2) A water flowmeter is repaired and reinstalled.

(3) A water flowmeter is repaired without removing the water flowmeter.

(4) An improper water flowmeter installation has been corrected.

(c) An extension of time to install a water flowmeter may be granted by the district for a reasonable period of time if just cause is shown to the district. Each appeal shall be filed with the board at least 10 days before a regularly scheduled board meeting. Just cause may include any of the following:

(1) A contract has been signed by the owner and the seller to sell or install the water flowmeter, but the seller cannot complete the sale or installation before diversion of water will take place.

(2) Weather conditions prevent the water flowmeter from being installed before the diversion of water.

(3) Legal proceedings prevent the owner from installing the water flowmeter.

(4) The supply of natural gas to power the well has been cut off by the seller of the natural gas for reasons beyond the control of the owner of the water right.

(d) A water flowmeter shall not be required to be installed if any of the following criteria is met:

(1) A well is authorized to divert 15 acre-feet or less per calendar year.

(2) Two or more wells are authorized by the same water right or approval of application with one authorized annual quantity of water for all the wells, and all of the water diverted by all of the wells is measured by a single water flowmeter prior to its application to beneficial use.

(3) The well is enrolled in a multiyear federal conservation program or the water rights conservation program pursuant to K.A.R. 5-7-4.

(4) The well is registered as inactive with the Kansas department of health and environment.

(5) An affidavit is filed by the owner with the district stating that the well is not, and will not be, operated until a water flowmeter meeting the specifications in K.A.R. 5-1-4 through 5-1-12 is properly installed. Thirty days before operating the well, the owner shall file a notice with the district indicating that a water flowmeter has been installed and indicate when the owner proposes to begin the diversion of water. (Authorized by and implementing K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5; effective May 1, 1981; amended May 1, 1985; amended Jan. 10, 2003.)

5-23-7 and 5-23-8. (Authorized by K.S.A. 1980 Supp. 82a-1028(o); implementing K.S.A. 1980 Supp. 82a-1028(n); effective May 1, 1981; revoked May 1, 1985.)

5-23-9. (Authorized by K.S.A. 1980 Supp. 82a-1028(o); implementing K.S.A. 1980 Supp. 82a-1028(n); effective May 1, 1981; revoked Aug. 28, 1989.)

5-23-10. Reserved.

5-23-11. Procedures for non-compliance with rules and regulations. The district, its board or manager, any eligible voter within the district, or any person residing within the district that is at least eighteen (18) years of age, may file a written complaint with the district alleging a violation of these rules and regulations, the management program, the groundwater management district act (K.S.A. 82a-1020 *et seq.*), or the water appropriation act (K.S.A. 82a-701 *et seq.*). The written complaint shall be filed at the district office.

Within thirty (30) days following the filing of the complaint, a representative of the district designated by the board shall investigate the complaint. If the representative of the district finds that a violation has existed or presently exists, the representative shall issue a written directive to the violator stating the nature of the violation and directing the violator to come into compliance with these rules and regulations.

If the violator fails to comply with the directive, the district may: (1) Seek to enjoin the violator's use of water by suitable action in district court until such time as the violator complies; or

(2) Seek the assistance of the chief engineer and the attorney general of the state of Kansas to enjoin the violator's use of water until such time as the violator complies. (Authorized by K.S.A. 1980 Supp. 82a-1028(o); implementing K.S.A. 1980 Supp. 82a-1028(n); effective May 1, 1981.)

5-23-14. Dakota aquifer system. All evaluations in the southwest Kansas groundwater management district no. 3 involving a determination of the extent of the confined and unconfined Dakota aquifer system shall use the information shown in the Kansas geological survey open file report number 98-37, released August 1998, which is hereby adopted by reference, unless the applicant or the district provides, or the chief engineer has available, better or more site-specific data concerning the extent of the confined and unconfined Dakota aquifer system. (Authorized by K.S.A. 82a-706a and K.S.A. 82a-1028(o); implementing K.S.A. 82a-709, K.S.A. 1999 Supp. 82a-711, and K.S.A. 82a-1028(n); effective Sept. 22, 2000.)

5-23-15. Saturated thickness of the high plains aquifer. All evaluations in the southwest Kansas groundwater management district no. 3 involving a determination of the saturated thickness of the high plains aquifer shall use the information shown in the Kansas geological survey open file report number 98-52, plate B, released February 1999, which is hereby adopted by reference, unless the applicant or the district provides, or the chief engineer has available, better or more site-specific data concerning the saturated thickness of the high plains aquifer. (Authorized by K.S.A. 82a-706a and K.S.A. 82a-1028(o); implementing K.S.A. 1999 Supp. 82a-711 and K.S.A. 82a-1028(n); effective Sept. 22, 2000.)

Article 24.—NORTHWEST KANSAS GROUNDWATER MANAGEMENT DISTRICT NO. 4

5-24-1. Definitions. As used in these regulations for the northwest Kansas groundwater management district no. 4, the following words and phrases shall have the following meanings. (a) "Area of consideration" means the two-mile-radius circle whose center is the location of the proposed point of diversion. The area of consideration equals 8,042 acres minus any area of the circle that is outside the state of Kansas.

(b) "Base acreage" has the meaning specified in K.A.R. 5-5-11(a).

(c) "Battery of wells" has the meaning specified in K.A.R. 5-1-1.

(d) "Board" means the board of directors constituting the governing body of the northwest Kansas groundwater management district no. 4.

(e) "District" means the northwest Kansas groundwater management district no. 4.

(f) "Tailwater" means that portion of the applied irrigation water that becomes runoff from the authorized place of use.

(g) "Theis analysis" means the Theis non-equilibrium equation analysis described in pp. 108-113 in "ground water and wells: a reference book for the water-well industry," published by Edward E. Johnson, Inc., Saint Paul, Minnesota, in 1966. The pages specified in this subsection are hereby adopted by reference.

(h) "Usable water" means water containing not more than 10,000 milligrams per liter of total dissolved solids.

(i) "Waste of water" has the meaning specified in K.A.R. 5-1-1.

(j) "Well" means any excavation that is drilled, cored, bored, washed, driven, dug, or otherwise constructed if the intended use of the excavation is for the acquisition, diversion, or artificial recharge of groundwater. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1983; amended May 1, 1985; amended Jan. 30, 2004.)

5-24-2. Allowable withdrawals. (a) Except as set forth in subsection (b) below, each application for an approval of application and each application for a change in the point of diversion shall be subject to the following requirements:

(1) The sum of the annual quantities of water of the proposed appropriation, the vested rights, prior appropriation rights, and earlier priority applications with a point of diversion authorized or proposed within the area of consideration that withdraw water from the same source of supply as the proposed point of diversion, as a hydraulically connected source of supply, shall not exceed the calculated quantity of annual recharge received by the aquifer underlying the area of consideration. The quantity authorized on all prior

permits, certificates, and vested rights, and the quantity requested on prior applications shall be used to calculate the sum of prior appropriations.

(2) All limitation clauses listed on permits and certificates shall be considered to be in force.

(3) In the case of an application for change in the point of diversion, all applications with a priority earlier than the priority established by the filing of the application for change shall be included in the analysis.

(4) The allowable annual appropriation shall be calculated using the formula Q = AR/12, in which the following values are used:

(A) Q is the allowable annual appropriation in acre-feet per year.

(B) A is the area of consideration.

(C) R is the average annual recharge in inches per year.

(5) The value of .5 inch per year shall be used for recharge, including natural recharge and return flow from irrigation.

(6) If a portion of the area of consideration is outside the district boundary, the evaluation shall be conducted as though the entire area of consideration were within the district boundary. If the perimeter of the area of consideration intersects a group of wells authorized under prior applications, permits, certificates, or vested rights, a reasonable quantity of water shall be assigned to each well based upon the best available information.

(b) The following types of applications shall not be subject to this regulation:

(1) A nondomestic application for an approval of application if the proposed point of diversion meets the following criteria:

(A) Is to be located in an alluvial aquifer not closed to new appropriations, except for domestic use, temporary permits, and term permits for five or fewer years;

(B) meets the well spacing requirements of K.A.R. 5-24-3; and

(C) meets the safe yield requirements of K.A.R. 5-3-9, K.A.R. 5-3-10, and K.A.R. 5-3-11;

(2) a nondomestic application to appropriate water from one or more of the following sources of supply:

(A) Niobrara;

(B) Carlile;

(C) Greenhorn;

(D) Dakota;

(E) Kiowa; or

(F) the Cheyenne formations if both of the following conditions are met:

(i) The well spacing requirements of K.A.R. 5-24-3 are met; and

(ii) the proposed point of diversion is located in an area where there is a natural hydraulic connection between all of the formations from which the applicant proposes to divert water;

(3) an application for a permit to appropriate water for domestic use;

(4) an application for a term permit for five years or less;

(5) an application for a temporary permit;

(6) an application for change in point of diversion if either of the following conditions is met:

(A) The authorized well has been drilled, cased, and test-pumped; or

(B) the authorized diversion works have been completed and a notice of completion was timely filed with the chief engineer under the current water right or approval of application;

(7) an application for an approval of application filed on an existing well currently authorized by a vested right, appropriation right, or approval of application that requests a quantity of water equal to or less than the currently available quantity of water that will be conjunctively reduced from a well authorized by either a vested right or certified appropriation right meeting either of the criteria specified in paragraph (c)(1);

(8) an application for an approval of application that meets the criteria of K.A.R. 5-24-10; and

(9) an application for an additional rate of diversion only that meets the requirements of K.A.R. 5-4-5.

(c)(1) To be exempt from this regulation, each application for an approval of application filed on an existing well currently authorized by a vested right, appropriation right, or approval of application that requests a quantity of water equal to or less than the currently available quantity of water that will be conjunctively reduced from a well authorized by either a vested right or certified appropriation right shall meet either of the following criteria:

(A) Be located within 2,640 feet of the existing well that will have its authorized quantity reduced; or

(B) be located within a distance from the currently authorized well for which a Theis analysis shows a .5 foot or greater drawdown, using the following assumptions:

(i) The certified rate of diversion of the currently authorized well;

(ii) the certified annual quantity of water for the currently authorized well;

(iii) the pumping time equal to the time it takes to pump the certified annual quantity at the certified rate of diversion;

(iv) the drawdown computed at the time equal to the pumping time; and

(v) the transmissivity and storage coefficient derived either from a time drawdown aquifer pump test of the currently authorized well or from use of the well log from the currently authorized well or a well log from a test hole or well located within 300 feet of the currently authorized well, using the procedure described in pages 26-27 of the United States geological survey's water-resources investigations report 85-4198, published in 1985. The pages specified in this paragraph are hereby adopted by reference.

(2)(A) For water rights authorized for irrigation use, the currently available quantity of water shall be calculated as follows:

(i) Determine the maximum number of acres actually irrigated during the perfection period. For vested rights, use the maximum number of acres irrigated in any one calendar year before June 29, 1945; and

(ii) use the 80 percent chance rainfall net irrigation requirements (NIR) for corn as set forth in K.A.R. 5-5-12 to determine the NIR for each acre, and then divide that value by .85 to adjust for efficiency.

(B) For non-irrigation water rights, the currently available quantity of water shall not exceed the actual consumptive use during the perfection period.

(3) Each well that has a reduced or new water right pursuant to this subsection shall be equipped with a water flowmeter meeting the requirements of article one of the chief engineer's regulations.

(4) The maximum distance that a well shall be relocated under paragraph (c)(1)(B) shall be the distance computed as described in paragraph (c)(1)(B), or 3,960 feet, whichever is less.

(5) The historic consumptive use of a well meeting the requirements of paragraph (b)(7) that is accounted for in the Republican river compact, K.S.A. 82a-518 and amendments thereto, accounting as a stream depletion reaching the Republican river downstream of Trenton dam shall not be transferred to a well that would cause a depletion reaching the Republican river upstream of Trenton dam.

(6) The total net acreage authorized by the following shall not exceed the current net total authorized acreage for both wells:

(i) The approval of application;

(ii) the water right being reduced; and

(iii) the water right currently authorizing the well for which the new water right is sought. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1983; amended May 1, 1985; amended May 1, 1987; amended Aug. 19, 1991; amended Jan. 30, 2004.)

5-24-3. Well spacing. (a) Except as specified in subsection (b), the spacing between each proposed well and all other wells authorized to withdraw water from the same source of water supply shall be as follows:

(1) In the Ogallala aquifer and in alluvial aquifers not closed to new appropriations, the required minimum spacing for nondomestic, nontemporary wells shall be as follows:

(A) 0 to 175 acre-feet requested: a minimum spacing of 1,400 feet;

(B) 176 to 350 acre-feet requested: a minimum spacing of 2,000 feet;

(C) 351 to 575 acre-feet requested: a minimum spacing of 2,400 feet; and

(D) more than 575 acre-feet requested: a minimum spacing of 2,800 feet.

(2) If the quantity of water authorized or applied for includes a fraction of an acre-foot, the quantity of water shall be rounded off to the nearest acre-foot of water for the purpose of applying this regulation.

(3) Each nondomestic well shall be spaced a minimum of 800 feet from each domestic well constructed in the same aquifer unless the chief engineer determines that one of the following criteria is met:

(A)(i) The domestic well is owned by the applicant;

(ii) the applicant signs a written request to waive the spacing requirement to the domestic well;

(iii) the applicant submits information documenting the location and depth of the domestic well, and any other information necessary to determine whether the domestic well is likely to be impaired; and

(iv) a Theis analysis or other hydraulic analysis done by the chief engineer shows that the do-

mestic well is not likely to be impaired by the proposed well; or

(B)(i) The owner of the domestic well signs a written request to waive the spacing requirement to the domestic well;

(ii) the applicant submits information documenting the location and depth of the domestic well, and any other information necessary to determine whether the domestic well is likely to be impaired; and

(iii) a Theis analysis or other hydraulic analysis done by the chief engineer shows that the domestic well is not likely to be impaired by the proposed well.

(4) Each nondomestic application for additional water from an existing well already authorized by one or more water rights shall meet the minimum spacing requirements in paragraph (a)(1) for the cumulative total of all existing water rights, earlier appropriations, and the proposed appropriation for that well.

(5) For a battery of wells, the well spacing shall meet the minimum spacing in paragraph (a)(1) based on the total amount of water applied for by the battery of wells. The minimum spacing distance shall be measured from the geocenter of the proposed battery of wells.

(6) Nondomestic wells withdrawing water from a cretaceous aquifer shall be spaced a minimum of four miles from all other wells withdrawing water from a hydraulically connected cretaceous aquifer. The spacing between a nondomestic well withdrawing water from a cretaceous aquifer and a domestic well withdrawing water from the same aquifer shall be a minimum of 2,640 feet unless one of the following criteria is met:

(A)(i) The domestic well is owned by the applicant;

(ii) the applicant signs a written request to waive the spacing requirement to the domestic well;

(iii) the applicant submits information documenting the location and depth of the domestic well, and any other information necessary to determine whether the domestic well is likely to be impaired; and

(iv) a Theis analysis or other hydraulic analysis by the chief engineer shows that the domestic well is not likely to be impaired by the proposed well; or

(B)(i) The owner of the domestic well signs a written request to reduce the spacing requirement to the domestic well;

(ii) the applicant submits information documenting the location and depth of the domestic well, and any other information necessary to determine whether the domestic well is likely to be impaired; and

(iii) a Theis analysis or other hydraulic analysis done by the chief engineer shows that the domestic well is not likely to be impaired by the proposed well.

(b) The well spacing requirements of subsection (a) shall not apply to the following:

(1) Spacing to a standby well;

(2) spacing to another well if either of the following conditions is met:

(A)(i) The other well is owned by the applicant;

(ii) the owner of the other well signs a written request to reduce the spacing requirement to the other well;

(iii) the applicant submits information documenting the location and depth of the other well, and any other information necessary to determine whether the other well is likely to be impaired by the proposed well; and

(iv) a Theis analysis or other hydraulic analysis done by the chief engineer shows that the proposed well is not likely to impair the other well; or

(B)(i) The owner of the other well files a written request to waive the spacing requirement to the proposed well;

(ii) the applicant submits information documenting the location and depth of the other well, and any other information necessary to determine whether the other well is likely to be impaired by the proposed well; and

(iii) a Theis analysis or other hydraulic analysis done by the chief engineer shows that the proposed well is not likely to impair the other well;

(3) a replacement well that meets one of the following criteria:

(A) The well is being replaced within 300 feet of the currently authorized location; or

(B) both of the following conditions are met:

(i) The proposed replacement well location increases the spacing to all other wells for which the spacing requirement was not met on the date the application for a change in point of diversion was filed; and

(ii) the proposed replacement well location continues to meet the requirements for spacing to all wells for which the well spacing requirement

was met at the time the application for change in point of diversion was filed; and

(4) an additional well if the original well and the additional well are owned by the same owner or owners. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1983; amended Jan. 30, 2004.)

5-24-4. Tailwater control and waste. No person shall commit or allow a waste of water as defined in K.A.R. 5-1-1. Runoff from precipitation shall not be considered a waste of water. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1983; amended Jan. 30, 2004.)

5-24-5. Allowable appropriation—reasonable use. (a) The maximum reasonable annual quantity of water for irrigation use shall not exceed the standards adopted in K.A.R. 5-3-19, K.A.R. 5-3-20, K.A.R. 5-3-21, K.A.R. 5-3-23, and K.A.R. 5-3-24.

(b) The annual quantity of water deemed reasonable on an application for municipal use shall be determined using the following criteria:

(1) The annual quantity of water needed for residential use shall be based on a population projection for the ensuing 20 years. The projected population shall be determined by extending present population for 20 years at one and one-half percent per year increase.

(2) The total quantity of water reasonable for the residential population shall then be determined by the following:

(A) Multiplying the projected population by the current per capita use; and

(B) adding a reasonable quantity of water for the present and projected industrial use for the ensuing 20-year-period.

(3) Municipalities may purchase, condemn, or otherwise acquire existing water rights in excess of the quantities set forth in paragraphs (b) (1) and (2) and apply to the chief engineer to change a reasonable quantity of the acquired water rights for municipal use, which shall not exceed 200 percent of the quantity considered reasonable pursuant to paragraphs (b)(1) and (2).

(c) The quantities of water deemed to be reasonable for livestock and poultry shall be determined pursuant to K.A.R. 5-3-22.

(d) All applications for any other type of beneficial use shall be reviewed to determine if the annual quantity of water and rate of diversion requested are reasonable for the intended use based on the best information available. (Authorized by K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5, and K.S.A. 82a-706a; implementing K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5; effective May 1, 1983; amended Aug. 19, 1991; amended Jan. 10, 2003.)

5-24-6. Changes in points of diversion. (a) Each replacement well shall meet all of the criteria in either of the following paragraphs:

(1)(A) Be located within 2,640 feet of the currently approved well location; and

(B) meet the well spacing criteria of K.A.R. 5-24-3; or

(2)(A) Be located within a distance from the currently authorized well for which a Theis analysis shows a .5 foot or greater drawdown, using the following assumptions:

(i) The certified rate of diversion of the currently authorized well;

(ii) the certified annual quantity of water for the currently authorized well;

(iii) the pumping time equal to the time it takes to pump the certified annual quantity at the certified rate of diversion;

(iv) the drawdown computed at the time equal to the pumping time;

(v) the transmissivity and storage coefficient derived either from a time drawdown aquifer pump test of the currently authorized well or from use of the well log from the currently authorized well or a well log from a test hole or well located within 300 feet of the currently authorized well, using the procedure specified in K.A.R. 5-24-2(c)(1)(B)(v); and

(B) meet the well spacing criteria of K.A.R. 5-24-3.

(b) The maximum distance that a well may be relocated under paragraph (a)(2) shall be the distance computed as specified in paragraph (a)(2), or 3,960 feet, whichever is less. If the historic consumptive use of the well being replaced is accounted for in the Republican river compact, K.S.A. 82a-518 and amendments thereto, accounting as a stream depletion reaching the Republican river downstream of Trenton dam, that consumptive use shall not be transferred to a well that would cause a depletion reaching the Republican river upstream of Trenton dam.

(c) No change in a point of diversion application that proposes to change the authorized point

of diversion from one well to a battery of wells shall be approved unless at least one of the following conditions has been met:

(1) Water is available for appropriation pursuant to K.S.A. 5-24-2 at the geocenter of the proposed battery of wells or would be available if the current water right were dismissed.

(2) The proposed battery of wells meets the requirements of K.A.R. 5-2-3. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1983; amended May 1, 1987; amended Jan. 30, 2004.)

5-24-7. Well construction criteria. (a) Each nondomestic well that is not subject to regulation under the Kansas chemigation safety law, K.S.A. 2-3301 et seq., and amendments thereto, and that is completed after May 1, 1983 shall include the installation of a check valve that meets or exceeds specifications adopted by the chief engineer which were in effect at the time the well was completed.

(b) All wells, including domestic wells, to be completed in a cretaceous aquifer shall be constructed in a manner that prevents the cretaceous aquifer from mixing with all quaternary, tertiary, and any other cretaceous water-bearing strata that have no natural hydraulic connection between the formation or formations in which the well will be screened. (Authorized by and implementing K.S.A. 82a-1028; effective May 1, 1983; amended Jan. 10, 2003.)

5-24-8. Resource development plans. (a) A resource development plan may be required by the district to be submitted for any of the following:

(1) A new application to appropriate water for irrigation use;

(2) a nonemergency application to change the place of use or the use made of water from irrigation to another type of use that involves an actual physical change in operation; or

(3) a new application to appropriate water for nonirrigation purposes if one of the following criteria is met:

(A) The quantity of water requested is likely to be unreasonable.

(B) The proposed beneficial use is likely to be inefficient.

(C) The proposed operation is likely to result in a waste of water.

(D) The owner or operator has a recent, documented history of noncompliance with the provisions of the Kansas water appropriation act or regulations adopted pursuant to the act.

(b) Each resource development plan shall include a description of the proposed operation, including the diversion works, the distribution system, and all other matters necessary to determine whether the proposed annual quantity of water is likely to be reasonable and not wasteful.

(c)(1) The applicant shall be notified by the district whenever an applicant is required to submit a resource development plan. This notification shall include the deadline for submitting the plan. The district shall then review the plan and submit it to the chief engineer with one of the following recommendations:

(A) The application should be approved because the proposed plan meets the regulatory requirements, and those portions of the plan consistent with the conservation plan guidelines adopted by the Kansas water office should be required as a conservation plan as a condition of the approval of application.

(B) The application should be approved if certain changes are made to the plan, and the amended plan should be required as a condition of the approval of application insofar as it is consistent with the water conservation planning guidelines adopted by the Kansas water office.

(C) The plan does not meet the regulatory requirements, and the application should not be approved.

(2) Each water conservation plan required by the chief engineer shall be made a condition of the approval of application. The required water conservation plan shall be fully implemented before diversion of water occurs pursuant to that approval of application. After the plan is implemented, the owner shall maintain the plan in a satisfactory manner.

(d) In addition to meeting the requirements specified in subsection (b), for irrigation use, the resource development plan shall meet the following requirements:

(1) Include irrigation system design, tailwater control methods, well yield, and cropping patterns; and

(2) comply with design criteria meeting the following requirements:

(A) Are set forth in the national engineering handbook (NEH), part 652, irrigation guide, dated November 13, 1997, as amended through

the Kansas state supplement dated May 8, 2003, which is hereby adopted by reference; and

(B) are consistent with the "irrigation water conservation program for the state of Kansas," published by the Kansas water office in November 1993 and hereby adopted by reference.

(e) For municipal use, the plan shall comply with the "Kansas 1990 municipal water conservation plan guidelines," second edition, which is published by the Kansas water office and hereby adopted by reference.

(f) In addition to meeting the requirements specified in subsection (b), for all other types of beneficial use, the resource development plan shall include a description of the proposed use of water in sufficient detail to determine if the proposed use is reasonable and not wasteful. (Authorized by K.S.A. 2002 Supp. 82a-1028 and K.S.A. 82a-706a; implementing K.S.A. 2002 Supp. 82a-1028; effective Jan. 10, 2003; amended Jan. 30, 2004.)

5-24-9. Water flowmeters. (a) Each of the following types of wells shall be equipped with a water flowmeter meeting the water flowmeter and installation specifications in K.A.R. 5-1-4 through K.A.R. 5-1-12 at the time the well is permitted:

(1) Any nondomestic, nontemporary well permitted or drilled after May 1,1980;

(2) any nondomestic, nontemporary well actually drilled after May 1, 1980 pursuant to an approval of an application for a change in point of diversion; and

(3) any well reduced in annual quantity of water authorized in order to allow approval of another application pursuant to K.A.R. 5-24-2.

(b) In addition to meeting the requirements of this regulation, each owner shall meet the requirements specified in K.A.R. 5-3-5e. (Authorized by K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5, and K.S.A. 82a-706a; implementing K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5, and K.S.A. 2001 Supp. 82a-1903, as amended by L. 2002, Ch. 137, § 7; effective Jan. 10, 2003.)

5-24-10. Exemptions for up to 15 acre-feet of groundwater. (a) In any area of the district that is subject to safe yield criteria and is not closed by specific regulation or intensive groundwater use control area order by the chief engineer to new nondomestic, nontemporary permits and term permits for five or fewer years, applications to appropriate groundwater shall be exempt from meeting the safe yield criteria if all the following conditions are met:

(1) The sum of the annual quantity requested by the proposed appropriation and the total annual quantities authorized by prior permits allowed because of an exemption pursuant to this regulation does not exceed 15 acre-feet in a one-mile-radius circle surrounding the proposed point of diversion.

(2) Well spacing criteria have been met.

(3) The approval of the application does not authorize an additional quantity of water out of an existing authorized well with a nondomestic permit or water right that would result in a total combined annual quantity of water authorized from that well in excess of 15 acre-feet.

(4) The approval of the application does not authorize an additional quantity of water to be used on a currently authorized nondomestic place of use.

(b) After the use of up to 15 acre-feet has been approved pursuant to this regulation, no application for change shall be approved for any quantity of water that would authorize the water to be diverted from a currently authorized point of diversion or onto a currently authorized place of use. (Authorized by K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5, and K.S.A. 82a-706a; implementing K.S.A. 82a-1028, as amended by L. 2002, Ch. 137, § 5; effective Jan. 10, 2003.)

5-24-11. Investigation and enforcement. The procedure set forth in this regulation shall be followed whenever enforcement action is taken by the district after it becomes aware that a person could be violating any of the regulations adopted by the chief engineer that relate to conservation and management of groundwater within the district.

(a) If a violation is discovered by the district's staff, the enforcement procedure shall begin with the step specified in subsection (c). In all other cases, a complaint may be filed with the district either verbally or in writing. The complaint shall describe and specify the following:

(1) The nature of the alleged violation;

(2) the location of the alleged violation;

(3) the name of the complainant;

(4) the mailing address of the complainant; and

(5) any other information necessary for the staff to understand the alleged violation and assist the staff in investigating the complaint.

(b) Before the staff makes any field investiga-

tion of the complaint, the staff shall make at least one attempt to contact an owner, operator, or other responsible representative of the water right or approval of application to notify the individual that a field investigation will be made.

(c) The district's staff shall make an investigation under either of the following circumstances:

(1) A complaint has been filed with the district, and the requirement specified in subsection (b) has been met.

(2) The district's staff discovers a violation of any regulation adopted by the chief engineer relating to conservation and management of groundwater within the district.

(d) A written report of the investigation shall be prepared by the staff. This report shall include any documents relied on or prepared by the staff in investigating the complaint or internally discovered violation. The report shall become a part of the official district record concerning the investigation. If a water right or an approval of application is involved, the report shall be made a part of that file.

(e) If the investigation shows that no violation has occurred or that enforcement action is not warranted, a copy of the report shall be sent to the complainant, if the investigation was prompted by a complaint, and the water right owner. A copy shall be retained in the district office. No further enforcement action shall be taken by the district at that time.

(f)(1) If the investigation determines or confirms that a violation has occurred, the report shall contain an order issued by the district staff, which shall be sent by restricted mail to the water right owner as shown in the district records and to any other person who is known by the district to have been committing the violation. The order shall specify and include the following:

(A) A description of the violation, including the specific regulations that are being violated;

(B) the actions necessary to correct the violation;

(C) a reasonable time frame to correct the violation;

(D) a statement that extensions of time to correct any violation may be granted by the staff if good cause is shown by the water right owner or other responsible party;

(E) a statement that the order is effective immediately;

(F) a statement that if the violation is corrected within the time specified by the order, the violator is required to notify the district, and an inspection will be conducted by the staff to determine if the violation has ceased;

(G) a statement that if any party desires to appeal an order issued by the staff, an appeal to the board is required to be requested within 15 days of the issuance of the order by a water right owner or violator;

(H) a statement that the request for an appeal may also request a stay of the order. If the requestor demonstrates good cause for a stay, a stay of the order may be granted by the staff or the board; and

(I) a statement that any subsequent violations of the same nature will be handled as a continuation of the current violation, not a new violation.

(2) A copy of the report shall be sent to the complainant.

(g) If the violation is corrected within the time frame specified by the order, the violator shall notify the district, and an inspection shall be conducted by the staff to determine if the violation has ceased. If the staff investigation determines that the violation has been corrected within the time frame specified by the order and in accordance with the district order, the enforcement activity by the district shall cease.

(h) If the violation has not been corrected within the time frame specified in the order and in the manner specified in the order, one or more of the following actions may be taken by the board:

(1) Seeking an injunction to stop the violation;

(2) requesting enforcement assistance from the chief engineer; or

(3) requesting enforcement assistance from the attorney general. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective Jan. 30, 2004.)

Article 25.—BIG BEND GROUNDWATER MANAGEMENT DISTRICT NO. 5

5-25-1. Definitions. As used in these regulations for the Big Bend groundwater management district no. 5, unless the context clearly requires otherwise, the following words and phrases shall have the meaning ascribed to them in this regulation:

(a) "Aquifer" means a geologic formation capable of yielding water in a quantity sufficient to supply water to a spring or pumping well.

(b) "Baseflow" means groundwater that seeps, flows, or is otherwise naturally discharged from an aquifer into a stream.

(c) "Baseflow node" means an artificial point located in the channel of a stream for the purpose of allocating a proportional amount of the baseflow to be considered when evaluating a new application to appropriate water from a proposed point of diversion located within two miles of the node.

(d) "Baseflow node allocation" means the annual quantity of water assigned to a baseflow node expressed in acre-feet per year. The baseflow node allocation shall be based on the natural discharge to a stream, which shall be the rate of flow in the stream that is equaled or exceeded 90 percent of the time.

(e) "Bedrock aquifer" means any consolidated material and unconsolidated material that is older than the Dakota formation of the Dakota aquifer system, as defined in K.A.R. 5-1-1, and that will yield water in a quantity sufficient to supply a spring or a pumping well.

(f) "Board" means the board of directors constituting the governing body of the Big Bend groundwater management district no. 5.

(g) "Dakota aquifer" means that portion of the Cretaceous Dakota formation that is capable of yielding water in a quantity sufficient to supply water to a spring or pumping well.

(h) "District" means the Big Bend groundwater management district no. 5.

(i) "Neat cement" means one 94-pound bag of Portland cement mixed with five to six gallons of clean water.

(j) "Portland cement" means class A, type I cement.

(k) "Stream" means any watercourse, or part of a watercourse, with a well-defined bed and banks that flows continuously during the calendar year, except during a drought.

(l) "Sustainable yield" means the long-term yield of the source of supply, including hydraulically connected surface water or groundwater, allowing for the reasonable raising and lowering of the water table.

(m) "Well" means any excavation that is drilled, cored, bored, washed, driven, dug, or otherwise constructed, either by nature or by man, when the proposed use of the excavation is for the acquisition, diversion, or artificial recharge of groundwater. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1980; amended May 1, 1987; amended April 19, 1996; amended Oct. 31, 2003.)

5-25-2. Well spacing. (a) With the exception of those wells described in subsection (b), the minimum spacing of all wells described in an application to appropriate water for beneficial use, other than those wells for domestic use, shall be 1,320 feet from the following:

(1) All other non-domestic wells and proposed non-domestic wells that carry an earlier priority; and

(2) baseflow nodes.

Non-domestic wells shall be 660 feet from all existing domestic wells, except those domestic wells owned by the applicant.

(b)(1) Each replacement well drilled within 100 feet of the originally authorized point of diversion shall be exempt from the well spacing requirement of subsection (a).

(2) Each non-domestic well that proposes the withdrawal of groundwater from the Dakota aquifer or any bedrock aquifer shall be one mile from all other wells withdrawing groundwater from the same formation, including domestic wells, except those domestic wells owned by the applicant. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1980; amended April 19, 1996; amended Oct. 31, 2003.)

5-25-2a. Change in point of diversion. (a) The location of a well requested in an application to change a point of diversion shall be no more than 2,640 feet from the point of diversion currently authorized by a vested right, appropriation right, or an application to appropriate water for beneficial use. This well shall also meet the minimum spacing requirement established in K.A.R. 5-25-2. If the point of diversion was not completed at the currently authorized point of diversion, the location of a well requested in an application to change the point of diversion shall be no more than 2,640 feet from the last authorized point of diversion for which the diversion works were completed.

(b) If the current authorization for a well requires one or more observation wells to be installed in accordance with K.A.R. 5-25-10, then the approval of an application for a change in the point of diversion shall also require the installation of one or more new observation wells in accord-

ance with K.A.R. 5-25-10 if either of the following conditions exists:

(1) The well is proposed to be located 300 feet or more from the currently authorized well location.

(2) The well is proposed to be located more than 50 feet and less than 300 feet from the currently authorized well location, and the water quality analysis required pursuant to K.A.R. 5- 25-10 shows that the chloride concentration exceeds 500 milligrams per liter (mg/l) at the currently authorized well location.

(c) The number and location of test holes or observation wells required for the approval of an application to change the point of diversion from a single well to a battery pursuant to subsection (b) shall be based on the locations and the number of wells in the proposed battery. Hydrologic factors, including groundwater flow direction, lithology, and chlorides at the location, shall be considered.

(d) An approval of an application to change the point of diversion shall not authorize the proposed well to be completed in an aquifer other than the aquifer or aquifers in which the currently authorized well was authorized to be completed. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective Oct. 31, 2003.)

5-25-3. Reasonable appropriation. (a) An application for a permit to appropriate water for irrigation use shall not be recommended by the board for approval for a quantity in excess of those quantities specified in K.A.R. 5-3-19.

(b) For livestock and poultry, the maximum annual quantity of water shall be limited to those quantities specified in K.A.R. 5-3-22.

(c) For all uses of water, the quantity of water requested shall be reasonable for the proposed beneficial use, and the approval shall neither impair an existing right nor prejudicially and unreasonably affect the public interest. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706, K.S.A. 82a-706a, K.S.A. 2002 Supp. 82a-711, and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1980; amended April 19, 1996; amended Oct. 31, 2003.)

5-25-4. Sustainable yield. (a) Except as set forth in subsections (b) and (c), the district has been determined to be appropriated to the sustainable yield level, and therefore the entire district shall be closed to further new surface water and groundwater appropriations filed on or after December 17, 1998.

(b) The following types of applications shall be exempt from the closure of the district to new appropriations of water described in subsection (a):

(1) Domestic use;

(2) temporary permits;

(3) applications for a change in the point of diversion for which the diversion works have been completed under the original approved application;

(4) standby wells used for emergency purposes only;

(5) permits to appropriate 15 acre-feet of water or less per year that are exempt pursuant to K.A.R. 5-25-15;

(6) term permit applications of one year or less and those term applications meeting the requirements of K.A.R. 5-25-13;

(7) permits to appropriate water from a bedrock aquifer;

(8) permits to appropriate water from the Dakota aquifer if the applicant can show either of the following:

(A) No Pleistocene aquifer exists within 5,280 feet of the proposed well location; or

(B) there is a significant difference in hydraulic head between the Pleistocene aquifer and the Dakota aquifer; and

(9) an application that proposes to use water in a manner so that there is no significant consumptive use of the local source of supply either in quantity or availability of water for use by other appropriators.

(c)(1) For each application for a change in the point of diversion, if the diversion works have not been completed, the application shall be exempt from the closure to new appropriations set forth in subsection (a). However, the proposed appropriation, when added to the vested rights, prior appropriation rights, earlier priority applications, term permits for more than a year, and all baseflow node allocations within a two-mile-radius circle whose center is the location of the proposed well, shall not exceed 1,500 acre-feet. It shall be assumed for purposes of analysis that all prior applications, permits, certificates, and vested rights are being fully exercised and that all limitation clauses listed on permits and certificates are in force.

(2) If part of the area within the two-mile-radius

circle around the proposed well location is outside the district boundaries, the 1,500 acre-feet quantity of water referred to above in paragraph (c)(1) shall be reduced proportionately by the percentage of the circle lying outside of the district boundaries. Only the baseflow node allocations, vested rights, prior appropriations, earlier priority applications, and term permits for more than one year ascribed to wells within the portion of the circle within the district shall be considered.

(3) If all of the wells authorized under a vested right or an application are not included inside the circumference of the circle, then a reasonable quantity shall be allocated to each well based upon the best available information.

(4) Each analysis for an application for a change in the point of diversion referred to in subsection (c) shall include all applications with a priority earlier than the priority established by the filing of the application for change. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706, K.S.A. 82a-706a, K.S.A. 2002 Supp. 82a-708b, and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1980; amended May 1, 1981; amended, T-86-4, March 22, 1985; amended May 1, 1986; amended May 1, 1987; amended May 1, 1988; amended April 19, 1996; amended March 16, 2001; amended Oct. 31, 2003.)

5-25-5. Well equipment. (a) Each non-domestic well, except any well authorized by a temporary permit, shall be equipped with a water flowmeter that meets or exceeds the requirements of subsection (c).

Each non-domestic, non-temporary well not subject to regulation under the Kansas chemigation safety law, K.S.A. 2-3301 et seq. and amendments thereto, shall be equipped with an in-line, automatic, quick-closing check valve capable of preventing pollution of the source of water supply.

(b) Each check valve installed shall meet or exceed the specifications set forth in K.A.R. 5-6-13a.

(c) Each water flowmeter required by the board, or pursuant to a regulation adopted by the chief engineer, before the effective date of this regulation, shall meet or exceed applicable requirements of article 1 of the division's regulations. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1980; amended May 1, 1985; amended April 19, 1996; amended Oct. 31, 2003.)

5-25-6. Reporting water use. Each water right owner shall report to the board the readings of water meters, gauges and other measuring devices at such times as may be required by the board. (Authorized by K.S.A. 82a-706a and K.S.A. 82a-1028(o); implementing K.S.A. 82a-1028(l); effective May 1, 1980; amended April 19, 1996.)

5-25-7. Water quality tests. Each water right owner shall take water samples from the owner's wells and have water quality analyses made on those samples at the owner's expense at times specified by the board. A laboratory licensed by the Kansas department of health and environment shall conduct the water quality analyses. The type of water quality analyses conducted shall be specified by the board. The owner shall submit the results of the water quality analyses to the board. (Authorized by K.S.A. 82a-706a and K.S.A. 82a-1028(o); implementing K.S.A. 82a-1028(k); effective May 1, 1980; amended April 19, 1996.)

5-25-8. Waste of water. A person shall not commit or allow a waste of water as defined in K.A.R. 5-1-1. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1980; amended April 19, 1996; amended Oct. 31, 2003.)

5-25-9. Procedures for non-compliance with rules and regulations. (a) The district's board or manager, any eligible voter or any person 18 years or older residing within the district may file a written complaint with the district alleging a violation of these rules and regulations, the management program, the groundwater management district act or the Kansas water appropriation act, as amended. The written complaint shall be filed at the district office.

(b) Within 30 days following the filing of the complaint, a representative of the district designated by the board shall investigate the complaint. If the representative of the district finds that a violation exists or did exist, the representative shall issue a written directive to the violator to come into compliance with the applicable rules and regulations, management program and laws, within a reasonable period of time.

(c) If the violator fails to comply with the directive of the representative within a reasonable period of time as determined by the board, the district may:

(1) seek to enjoin the violator's use of water by

suitable action in district court until such time as the violator complies;

(2) seek the assistance of the chief engineer and attorney general of the state of Kansas to enjoin the violator's use of water until such time as the violator complies; or

(3) pursue other courses of action in the public interest. (Authorized by K.S.A. 82a-706a and K.S.A. 82a-1028(o); implementing K.S.A. 82a-1028(n); effective May 1, 1980; amended May 1, 1981; amended April 19, 1996.)

5-25-10. Test holes and water quality analyses. (a) Except for those types of applications described in K.A.R. 5-25-4(b), each applicant proposing to divert groundwater for non-domestic use within the district shall drill a test hole that shall meet the following requirements:

(1) Be drilled within 20 feet of the proposed well to the bottom of the aquifer;

(2) be completed as an observation well according to the following specifications:

(A) A casing made of schedule 80 PVC with a minimum outside diameter of three inches shall be used;

(B) five feet of well screen shall be installed at the base of the usable aquifer;

(C) the annular space shall be grouted with neat cement from the top of the well screen to the land surface; and

(D) centralizers shall be placed on the casing at intervals of not greater than 40 feet starting at the bottom of the casing; and

(3) be drilled under the supervision of the district.

(b) Each applicant shall have a water sample taken from within five feet of the bottom of the aquifer and shall have the water sample analyzed for chloride content by a laboratory certified by the Kansas department of health and environment. The applicant shall furnish the results of the water quality analysis and a copy of the test hole log to the district.

(c) If the analysis of the water sample taken within five feet of the bottom of the aquifer indicates that the chloride content exceeds 500 milligrams per liter (mg/l), the application to appropriate water shall be recommended for denial by the district unless both of the following conditions are met:

(1) The applicant shows that approval of the application will not cause an unreasonable deterioration of the water quality nor prejudicially and unreasonably affect the public interest.

(2) The applicant desires to proceed and is willing, at the applicant's expense, to drill and complete at least two additional observation wells at locations to be determined by the district based on the lithology and the construction of the proposed well. Both of these two additional observation wells shall be constructed according to specifications adopted by the district and in the presence of a representative of the district. The two additional observation wells shall be constructed and screened above the saltwater and freshwater interface at a depth specified by the district. If the proposed point of diversion is to be a well battery, the number and location of the test holes and observation wells required shall be determined by the district based on the best hydrogeologic information available, including groundwater flow direction, lithology, and chloride levels.

(d) If at any time the chloride concentration in either of the latter two observation wells exceeds 500 mg/l, the owner shall reduce the instantaneous rate of pumping or the annual quantity pumped, or both, as necessary to reduce the chloride concentration in both observation wells to below 500 mg/l.

(e) The permit shall be dismissed and the owner shall properly plug the well at the owner's expense if either of the following occurs:

(1) Within one year after the chloride concentrations exceed 500 mg/l in either of the two observation wells, the chloride concentrations are not reduced below 500 mg/l.

(2) Operation of the well causes impairment of any other water right, including a domestic water right. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a, and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1983; amended April 19, 1996; amended Oct. 31, 2003.)

5-25-11. Determination of well locations. If a question arises as to where a well is located, the burden of proof shall remain upon the applicant to show the actual location of the well in question. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective May 1, 1983; amended Oct. 31, 2003.)

5-25-12. Approval of application for additional rate only. Each application for a permit to appropriate water for beneficial use that re-

quests only an increase in the authorized rate of diversion, and no net increase in maximum annual quantity, from a specific point of diversion already authorized by another water right or approval of application shall be exempt from meeting the requirements of K.A.R. 5-25-4 if the application meets the requirements of K.A.R. 5-4-5. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective Oct. 31, 2003.)

5-25-13. Term permits. The approval of an application, or an extension of a term permit, for more than one year may be granted only if one of the following conditions is met:

(a) The term permit authorizes the use of contaminated water. For the purpose of this regulation, water containing chlorides in excess of 1,000 milligrams per liter (mg/l) shall be considered to be contaminated. For other types of contamination, the level of contamination at which an application may be approved in accordance with this regulation shall be based on the best information available.

(b) The term permit authorizes the use of water for aquifer remediation.

(c) The term permit authorizes hydraulic dredging.

(d) The applicant demonstrates that approval of an extension of the expiration date of a term permit for more than one year will neither impair a use under an existing water right or approval of application nor prejudicially and unreasonably affect the public interest. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective Oct. 31, 2003.)

5-25-14. Battery of wells. (a) An application for a change in point of diversion to convert one well to a battery of wells, as defined in K.A.R. 5-1-1, shall not be considered for approval unless all of the criteria in paragraph (a)(1), (2), or (3) below are met:

(1)(A) The proposed battery of wells meets the definition of a battery of wells as defined in K.A.R. 5-1-1.

(B) The time to construct the diversion works has not expired.

(C) The proposed rate of diversion does not exceed the currently authorized rate of diversion.

(2)(A) The proposed battery of wells meets the definition of a battery of wells as defined in K.A.R. 5-1-1.

(B) Water is available for appropriation at the geocenter of the proposed well battery based on the criteria set forth in K.A.R. 5-25-4(c).

(C) The proposed rate of diversion does not exceed the currently authorized rate of diversion.

(3)(A) The proposed battery of wells meets the definition of a battery of wells as defined in K.A.R. 5-1-1.

(B) A certificate of appropriation has been issued pursuant to K.S.A. 82a-714 and amendments thereto.

(C) The maximum instantaneous rate of diversion approved shall be either of the following:

(i) The maximum instantaneous rate of diversion under normal operating conditions actually used during any of the three consecutive calendar years before the date of the application for change; or

(ii) the tested rate of diversion achieved under actual operating conditions made by a tester approved by the chief engineer. The test of the rate of diversion shall be made within six months either before or after the change application is filed.

(D) The proposed rate of diversion does not exceed the currently authorized rate of diversion.

(b) In addition to meeting the requirements specified in subsection (a), the applicant shall also demonstrate that approval of the battery of wells will not impair existing water rights or approvals of applications and will not prejudicially and unreasonably affect the public interest.

(c) Each permit shall also be conditioned by the chief engineer so that the permit is subject to K.A.R. 5-25-2a (b) and (c). (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706, K.S.A. 82a-706a, K.S.A. 2002 Supp. 82a-706b, and K.S.A. 2002 Supp. 82a-1028; effective Oct. 31, 2003.)

5-25-15. Exemptions for up to 15 acre-feet of groundwater. Except as specified in subsection (b), an application to appropriate groundwater for up to 15 acre-feet of water shall be approved if all of the criteria in subsection (a) are met:

(a) (1) The sum of the annual quantity of water requested by the new application and the total annual quantities authorized by prior approvals of

applications because of an exemption pursuant to this regulation does not exceed 15 acre-feet in a ½-mile-radius circle surrounding the proposed point of diversion.

(2) The proposed well meets the well spacing criteria set forth in K.A.R. 5-25-2.

(3) The approval of application will not authorize an additional quantity of water out of an existing authorized well with a non-domestic permit or water right that would result in a total combined annual quantity of water authorized from that well in excess of 15 acre-feet.

(4) The applicant demonstrates that approval of up to 15 acre-feet of water will not impair existing water rights or approvals of applications and will not prejudicially and unreasonably affect the public interest.

(5) All other criteria for processing a new application to appropriate water have been met.

(b) Exemptions to approve a new application to appropriate water in accordance with this regulation shall not be approved if the exemption would conflict with one of the following:

(1) The provisions of an intensive groundwater use control area order issued by the chief engineer pursuant to K.S.A. 82a-1036 through K.S.A. 82a-1040, and amendments thereto; or

(2) the implementation of a water right purchase program in the Rattlesnake creek basin in both of the following:

(A) The corridor; and

(B) the number two priority area as shown in figure two of the Rattlesnake creek management plan accepted by the chief engineer on July 11, 2000.

(c) After the use of up to 15 acre-feet has been approved pursuant to this regulation, no application for change shall be approved for that quantity of water that would authorize that water to be diverted from another authorized point of diversion.

(d) An application approved as an exemption under this regulation shall not be leased or placed in a water bank so that it can be diverted at another location. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706, K.S.A. 82a-706a, K.S.A. 2002 Supp. 82a-711, and K.S.A. 2002 Supp. 82a-1028; effective Oct. 31, 2003.)

5-25-16. Water quality analyses and observation wells in the Rattlesnake creek subbasin. Groundwater rights that have points of diversion located in the Rattlesnake creek subbasin east and north of federal highways US-281 and US-50 shall be subject to the following requirements: (a) The water right owner, or the authorized representative, shall test water samples to determine, as needed, whether the water being pumped contains more than 300 milligrams of chlorides per liter. The district may require the tests to be made at a frequency not to exceed once in 365 days.

All water quality samples shall be taken in the presence of an authorized representative of the district, and one-half of the sample shall be given to the authorized representative of the district when the sample is taken. The owner shall have the water sample analyzed for chloride content by a laboratory certified by the Kansas department of health and environment. The applicant shall furnish the results of the water quality analysis to the district within 60 days after the date the sample was taken.

(b) If the analysis of the water sample taken indicates that the chloride content exceeds 300 milligrams of chlorides per liter, the owner shall be required, before any approval of a change in point of diversion, to drill an observation well to bedrock in the manner specified in K.A.R. 5-25-10(a). (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706, K.S.A. 82a-706a, K.S.A. 2002 Supp. 82a-708b, and K.S.A. 2002 Supp. 82a-1028; effective Oct. 31, 2003.)

5-25-17. Voluntary reductions of water rights in the Rattlesnake creek subbasin. Each water right owner in the Rattlesnake creek subbasin that agrees to meet, and does meet, all of the conditions specified in subsections (a) through (e) no later than March 31, 2004 on a water right for a center pivot irrigation system with a priority date on or before April 12, 1984 shall receive a credit toward any reduction required by alternative management actions implemented in accordance with the Rattlesnake creek basin management program accepted by the chief engineer on July 11, 2000. The amount of the credit shall be calculated by multiplying by 1.5 the total number of years that the water right has been voluntarily reduced in accordance with the terms of this regulation before any alternative actions are taken under this program times the quantity of water that was voluntarily reduced. Water right

owners who have taken a reduction in their water right under this regulation shall have any further reduction through the Rattlesnake creek basin management program based on the authorized amount before a voluntary reduction is made under this regulation.

(a) The owner permanently reduces the maximum number of acres actually irrigated in any one calendar year during the period 1987 through 1996 by the number of acres previously watered by the end gun and provides documentation to the chief engineer of the number and location of the acres irrigated by the end gun during the period 1987 through 1996.

(b) The owner removes the end gun from the center pivot and certifies to the chief engineer what type of end gun has been removed.

(c) The owner installs pressure regulators on the center pivot to prevent the same rate of diversion from being pumped after the end gun is removed as was pumped before the end gun was removed and certifies to the chief engineer what pressure regulators have been installed.

(d) The chief engineer permanently reduces the authorized place of use of that water right by the maximum number of acres actually irrigated in any one calendar year by the end gun during the period 1987 through 1996.

(e) The chief engineer permanently reduces the maximum annual quantity authorized by that water right by the quantity of water that is calculated by multiplying the number of acres previously watered by the end gun times the net irrigation requirements (NIR) for the 50 percent chance rainfall for the county in which the point of diversion is located, as set forth in K.A.R. 5-5-12. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective Oct. 31, 2003.)

5-25-18. Changes of well locations within the Rattlesnake creek basin. (a) Each application to change the location of a well within the Rattlesnake creek basin by more than 2,640 feet may be approved by the chief engineer if all of the following conditions are met:

(1) The source of water supply for the currently authorized well and the proposed well is the Rattlesnake creek basin as defined in K.A.R. 5-6-15.

(2) The currently authorized well is located within the corridor or the number two priority decline area as defined in figure two of the Rattlesnake creek management plan accepted by the chief engineer on July 11, 2000.

(3) The well will be moved to a location outside the corridor or the number two priority decline area as defined in figure two of the Rattlesnake creek management plan accepted by the chief engineer on July 11, 2000.

(4) The average saturated thickness in the two-mile-radius circle in which the proposed well will be located is greater than 40 feet as shown on the saturated thickness map adopted by reference in K.A.R. 5-25-19.

(5) The water level within the two-mile-radius circle surrounding the proposed well location has not declined in excess of 20 feet of the predevelopment water level as shown in Kansas geological survey bulletins numbered 65, 80, and 88.

(6) The change proposes the relocation of all the water right or a divided water right.

(7) No other well has previously been authorized by the chief engineer to be relocated within a one-mile radius of the proposed well location under the provisions of this regulation, or the applicant demonstrates that the proposed well will not impair existing water rights.

(8) The water right that is proposed to be changed is vested or certified.

(9) All other statutory and regulatory requirements for approval of a change in point of diversion that do not conflict with this regulation are met.

(b) The approval of the change in point of diversion shall be subject to the conditions specified in this subsection:

The approval of the application to change the point of diversion shall be subject to review by the chief engineer 10 years after the approval of the change application. If the water level at the new well location has declined in excess of 10 feet from the date the new well was drilled, for the sole purpose of administering wells concerning direct impairment, the new well shall be considered to have the priority of the date of the application to change the point of diversion. The owner of the well shall have the option of applying for another change in point of diversion.

(c) The quantity of water that can be approved for a change in point of diversion meeting the requirements of subsection (a) above shall be determined based on the following tables.

Points

point value for each column at right	saturated thickness at proposed well site, in feet	quantity of water authorized in two-mile-radius circle around proposed well, in acre-feet	feet of decline in two-mile-radius circle around proposed well since pre-development
1	146+	0-1,500	0-4
2	111-145	1,501-3,000	5-8
3	91-110	3,001-4,500	9-12
4	66-90	4,501-6,000	13-16
5	41- 65	6,001+	17-20

Percent of a water right that can be moved to a new location

number of points scored by proposed well	percent of water right that can be moved to new well location
3-6	100
7-9	90
10-12	80
13-15	70

(Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective Oct. 31, 2003.)

5-25-19. Saturated thickness map. (a) The following electronic data files, all dated July 10, 2002 and prepared by the district using data developed by the Kansas geological survey and the district, are hereby adopted by reference by the chief engineer:

(1) Rattlesnake basin.dbf;
(2) Rattlesnake basin.sbn;
(3) Rattlesnake basin.sbx;
(4) Rattlesnake basin.shp;
(5) Rattlesnake basin.shx; and
(6) Wln.dbf.

(b) Except as set forth in subsection (c), the electronic data files described in subsection (a) shall be used in all situations in which determination of the saturated thickness of the aquifer within the boundaries of the district is necessary.

(c) The saturated thickness shown in the electronic data files shall be used unless the applicant provides, or the chief engineer has available, better or more site-specific data concerning the actual saturated thickness of the two-mile-radius circle surrounding the well in question. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; effective Oct. 31, 2003.)

5-25-20. Recommendations by the board. (a) The following types of applications shall be submitted by the chief engineer to the district for review and recommendation:

(1) All applications to appropriate water for beneficial use, except for temporary use and domestic use; and

(2) all applications to change the point of diversion, place of use, the use made of the water, or any combination thereof, except applications to move the point of diversion less than 300 feet.

(b) The district shall conduct a review of the proposed application. Except as set forth in subsection (d), the district's recommendation to the chief engineer shall be consistent with the provisions of the Kansas water appropriation act, the groundwater management district act, and the regulations adopted by the chief engineer pursuant to those acts.

(c) Within 15 working days after the date the chief engineer submits the application to the district for review, or within any extension of time authorized by the chief engineer, the district shall submit its findings and recommendation for approval, denial, or modification of the application and shall specify the basis for the recommendation.

(d) The district may submit to the chief engineer a written recommendation of an exemption from or a waiver of a regulation. If the district submits such a recommendation, the district shall demonstrate to the chief engineer that the granting of the proposed waiver or exemption will not prejudicially and unreasonably affect the public interest and will not cause impairment of any existing water right. (Authorized by K.S.A. 82a-706a and K.S.A. 2002 Supp. 82a-1028; implementing K.S.A. 82a-706, K.S.A. 82a-706a, and K.S.A. 2002 Supp. 82a-711; effective Oct. 31, 2003.)

Articles 26 to 29.—RESERVED

Article 30.—DAMS

5-30-1. Approval of or permits for dams. The chief engineer shall not approve or grant a permit for any dam subject to the jurisdiction of the chief engineer under the authority of K.S.A. 1979 Supp. 82a-301 through 305a as amended, unless the applicant also receives prior approval

of his or her application to appropriate water for beneficial use to be diverted by means of the dam for which the approval or permit is sought, unless the sole proposed use for the water is for domestic use. (Authorized by K.S.A. 82a-706a, 82a-709; effective May 1, 1980.)

Articles 31 to 39.—RESERVED

Article 40.—DESIGN OF EARTH DAMS

5-40-1. Definitions. As used in K.S.A. 82a-301 through 82a-305a and amendments thereto, in the regulations adopted pursuant thereto, and by the division of water resources in administering K.S.A. 82a-301 through 82a-305a and amendments thereto, unless the context clearly requires otherwise, the following words and phrases shall have the meaning ascribed to them in this regulation: (a) "Application" means the formal document submitted to the chief engineer requesting a permit, in accordance with the provisions of K.S.A. 82a-301 through 82a-305a and amendments thereto, that authorizes the applicant to proceed with the construction of a proposed dam, channel change, or stream obstruction.

(b) "Authorized representative" means any staff employee designated by the chief engineer to perform duties and functions on behalf of the chief engineer.

(c) "Channel change or stream obstruction" means any project or structure, including any dam, that meets either of the following criteria:

(1) Does not extend above the higher natural bank; or

(2) alters the course, current, or cross section of any stream of the state.

(d) "Chief engineer" means the chief engineer, division of water resources of the Kansas department of agriculture.

(e) "Dam" means any artificial barrier, together with appurtenant works, that does, or may, impound water.

(f) "Freeboard" means the vertical distance between the maximum stage attained in the design storm event and the top of the structure.

(g) "Navigable stream" means the Arkansas river, the Missouri river, and the Kansas river.

(h) "Perennial stream" means a stream, or part of a stream, that flows continuously during all of the calendar year, except during an extreme drought.

(i) "Permit" means the formal document that is issued by the chief engineer to the sponsor of a project and that authorizes the sponsor to proceed with the construction of the dam, channel change, or stream obstruction.

(j) "Reservoir" means the area upstream from a dam that contains, or will contain, impounded water.

(k) "Stream" means any watercourse that has a well-defined bed and banks, and that has a watershed above the geographic point in question that exceeds the following number of acres:

(1) Zone three: 640 acres for all geographic points within any county west of a line formed by the adjoining eastern boundaries of Phillips, Rooks, Ellis, Rush, Pawnee, Edwards, Kiowa, and Comanche counties;

(2) zone two: 320 acres for all geographic points within any county located east of zone three and west of a line formed by the adjoining eastern boundaries of Republic, Cloud, Ottawa, Saline, McPherson, Reno, Kingman, and Harper counties; and

(3) zone one: 240 acres for all geographic points within any county located east of zone two. The stream need not flow continuously and may flow only briefly after a rain in the watershed. If the site of the project has been altered so that a determination of whether the well-defined bed and banks exist is not possible, it shall be presumed that they did exist if the watershed acreage criteria have been met, unless the owner of the project can conclusively demonstrate that the well-defined bed and banks did not exist before the construction of the project.

(l) "Watershed" means all of the area draining toward a selected point on a stream. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-302; effective May 1, 1983; amended May 1, 1987; amended, T-5-12-30-91, Dec. 30, 1991; amended Feb. 17, 1992; amended Sept. 22, 2000.)

5-40-2. Dams; plans and specifications. Plans for dams shall include: (a) Plan view of dam and dam site. The plan view of the dam and dam site may be shown in connection with the topographic map of the reservoir basin, providing the scale is sufficiently large to show adequate detail. A separate plan view shall be used if necessary to clearly show the features of the entire area in which the dam and spillway are to be located, and the details required below. The area covered by this view shall be on both abutments of the dam as well as a considerable distance both upstream

and downstream from the dam. All elevations shown on plans shall be referred to permanent bench marks described on the plans. The following details shall be shown:

(1) Location of the axis of the dam, showing stationing and top width limits;

(2) toe of upstream and downstream slopes;

(3) location of center line and limits of emergency spillway;

(4) location of principal spillway and any stilling basin;

(5) location of berms;

(6) location of slope protection;

(7) location of borings or test holes and test pits;

(8) location of intakes, outlets, valves and valve wells;

(9) location, description and elevation of permanent bench marks; and

(10) location, description and details of all foundation drains;

(b) Map of drainage pattern above and below the dam site. A map, to a scale no smaller than one inch to 2,000 feet, shall show the location of the watercourse across which the dam is to be built and its tributaries above the dam site. The following shall also be shown: (1) The location of the dam and the outline of the reservoir;

(2) the boundary of the watershed, shown by a line enclosing the entire area that will drain into the reservoir;

(3) section lines, with sections properly identified;

(4) size of the drainage area;

(5) the land owned by the sponsor; and

(6) roads, railroads, pipeline crossings and any other prominent features in the vicinity. The point where the axis of the dam crosses the stream shall be shown on this map by showing distances and angles from an apparent section corner or quarter corner. It shall be acceptable to utilize an aerial photograph to make this determination;

(c) Topographic map of the reservoir basin. A topographic map of the dam site and reservoir area shall be shown to the following scale:

Surface areas at top of dam	Acceptable scale
less than 30 acres	one inch to 100 feet
30 acres through 100 acres	one inch to 200 feet
more than 100 acres	one inch to 300 feet

The location of the dam shall be superimposed on this map. Topography shall be shown by contours at two foot intervals. For dams more than 20 feet in height, contours may be spaced at greater intervals, but shall not exceed five feet. In addition, contours equivalent to the elevation of the lowest uncontrolled opening (permanent pool), elevation of the crest of the emergency spillway, and elevation of the top of the dam shall be shown. The elevation of each contour shall be clearly noted on the map;

(d) Cross section of dam site and longitudinal section of dam. The cross section of the valley at the dam site shall be taken along the axis of the dam. A separate cross section view shall be used if necessary to clearly show the details required below. The details on this section shall include the following:

(1) Elevation to which the top of the dam is to be maintained and the elevation to which it is to be initially constructed in order to provide an adequate settlement allowance;

(2) elevation of the stream bed;

(3) location and elevation of the crest of the emergency spillway;

(4) location and elevation of the crest of the principal spillway;

(5) elevation of any berms;

(6) original surface of the ground;

(7) proposed elevations and dimensions of cutoff trench;

(8) location and elevation of outlet works;

(9) location of test holes showing materials encountered in the section; and

(10) location, description and elevations of all foundation drains;

(e) Cross section of dam. A cross section of the dam at the deepest point shall be shown. If the cross section is variable, a typical section shall be shown for each reach with proper description of the reach by stationing. Additional cross sections along the axis of the principal spillway and the axis of any other outlets shall be shown. Cross sections of the dam shall include the following:

(1) Elevation and width of the top of the dam;

(2) elevation and width of any berms;

(3) slopes of the upstream and downstream faces of the dam;

(4) elevation, location and type of slope protection;

(5) zones of earth embankment;

(6) dimensions to which the dam is to be constructed to provide an adequate allowance for settlement;

(7) elevation, location and dimensions of cutoff trench and core wall; and

(8) location of all foundation drains;

(f) Plan, profile, and cross section of emergency spillway. Details of the emergency spillway shall include the following:

(1) Plan view showing the location and stationing along the center line of the emergency spillway, together with the location of the control section and details of riprap or other slope and floor protection;

(2) sections showing elevations, slopes and dimensions of the spillway; and

(3) profile along the axis of the spillway, extending from the reservoir area through the control section to the stream bed below the dam. Stationing on the profile shall correspond to that on the plan view. This profile shall show the existing ground elevation, proposed grade of the bottom of the spillway, elevation of slope protection on the side slopes, and the nature of the material through which the spillway is excavated;

(g) Profile of principal spillway. Details of the principal spillway shall include the profile along the axis of the spillway, extending from the intake to the outlet, showing the size and spacing of the cutoff collars. This profile shall show existing ground elevations and the proposed grade of the spillway. Details of the stilling basin, supports and other features shall also be shown;

(h) Reservoir data. The number of acres enclosed by each contour within the reservoir basin and the total storage capacity of the reservoir in acre-feet at the elevation of each contour shall be determined and tabulated on the plan. The data shall be compiled for all contours in the reservoir up to the elevation of the top of the dam. Computations of capacity shall be based on the natural topography of the reservoir basin including the volume of any excavation in the reservoir below the emergency spillway made during construction of the dam. When the reservoir is divided between more than one landowner, the property lines shall be shown on the topographic map of the basin;

(i) Bench marks. At least two permanent bench marks shall be set for future reference conveniently located for use after construction. The bench marks shall be placed where they will not be destroyed or submerged after the reservoir fills, preferably, at a location along the axis of the dam near both dam extremities. A three or four foot length of pipe or steel driven flush with the ground in an area which is unlikely to be disturbed may be used. Wood or plastic stakes, nails, or marks in trees shall not be considered as permanent bench marks. The location and description of the bench marks shall be shown on the plans. They shall be properly referenced so that they can be easily found in the field. Elevations for size two, size three and size four structures shall be referenced to the national geodetic vertical datum of 1929 to a tolerance of plus or minus one half foot. Elevations for size one structures shall be referred to any assumed datum; and

(j) Spillway discharge capacity data. (1) A curve or table showing discharge capacity of the emergency spillway, in cubic feet per second, shall be developed and shown on the plan.

(2) A curve or table showing discharge capacity of the principal spillway, in cubic feet per second, shall be developed and shown on the plan.

(k) Each application for a permit to construct a class (c) high hazard dam shall include an emergency preparedness plan. (Authorized by K.S.A 82a-303a; implementing K.S.A. 82a-302; effective May 1, 1983; amended May 1, 1985; amended May 1, 1987.)

5-40-3. Specifications. The specifications for dams, channel changes and obstructions shall be prepared on 8½ by 11 inch sheets of a good grade of white bond paper. The specifications shall be in sufficient detail to assure that the works will be properly executed and shall comply with currently accepted engineering practices. The specifications shall include provisions for: (a) Adequate supervision during the period of construction by a person qualified to design the structure;

(b) notification of the division of water resources of the status of construction; and

(c) inspection by representatives of the division of water resources. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-302; effective May 1, 1983; amended May 1, 1987.)

5-40-4. Preparer of maps, plans, profiles, and specifications. In addition to the requirements of the Kansas board of technical professions, the requirements in this regulation shall apply. (a) Each map, plan, profile, and specification submitted to the chief engineer for approval shall be prepared by a person who is competent in the design and construction of dams, channel changes, or stream obstructions, as appropriate.

(b) Maps, plans, profiles, and specifications for any dam that meets one of the following criteria shall be prepared by a licensed professional en-

gineer who is competent in the design and construction of dams:

(1) Impounds 50 acre-feet or more at the top of the dam;

(2) is 25 feet or more in height; or

(3) is either a class (b) or class (c) hazard dam.

(c) Maps, plans, profiles, and specifications for any channel change or stream obstruction project on a navigable stream or a stream having a mean annual flow of 100 cubic feet per second or more at the proposed location of the project shall be prepared by a licensed professional engineer who is competent in the design of that type of project.

(d) No provision of this regulation, nor any decision made by the chief engineer pursuant to this regulation, shall alter the responsibilities or duties of any licensee of the Kansas board of technical professions to comply with that board's requirements. (Authorized by K.S.A. 82a- 303a; implementing K.S.A. 82a-302; effective May 1, 1983; amended May 1, 1986; amended May 1, 1987; amended Sept. 22, 2000.)

5-40-5. Determining capacity of reservoir. To determine whether a dam impounds 30 acre-feet of water, pursuant to K.S.A. 82a-304, that measurement shall be made at the lowest elevation of the top of the dam. (Authorized by K.S.A. 1982 Supp. 82a-303a; implementing K.S.A. 82a-302; effective May 1, 1983.)

5-40-6. Waiver and stricter requirements. (a) The chief engineer may waive any of the regulations adopted under articles 40, 41, 42 and 43 if it is shown to the satisfaction of the chief engineer that the waiver of the regulation will not pose a hazard to the public safety and that the waiver is in the public interest.

(b) The chief engineer may also invoke any jurisdiction granted by statute and impose stricter requirements than required by rules and regulations where such jurisdiction or additional requirements are necessary to protect the public interest, protect the public safety or prevent damage to property. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective May 1, 1983; amended May 1, 1987.)

5-40-7. Other maps, plans, profiles, data and specifications. The applicant shall also submit any other maps, plans, profiles and specifications of the dam, channel change or obstruction and any other data which the chief engineer may require. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-302; effective May 1, 1983; amended May 1, 1987.)

5-40-8. Application. The application shall be filed on the prescribed form or forms furnished by the chief engineer and shall be completed in proper form. (Authorized by K.S.A. 1982 Supp. 82a-303a; implementing K.S.A. 82a-302; effective May 1, 1983.)

5-40-9. Adoption by reference. All of "engineering guide-1" (eg-1), relating to earth dams, hazard classes, spillway requirements, detention storage requirements and rainfall data, as revised May 1, 1986, by the Kansas state board of agriculture, division of water resources, is hereby adopted by reference and shall apply to dams constructed in this state. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-302; effective May 1, 1983; amended May 1, 1985; amended May 1, 1986.)

5-40-10. Adoption by reference. All of "engineering guide-2" (eg-2), relating to administrative requirements and criteria for the design of earth dams, as revised May 1, 1986, by the Kansas state board of agriculture, division of water resources, is hereby adopted by reference and shall apply to dams constructed or modified in this state. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-302; effective May 1, 1984; amended May 1, 1985; amended May 1, 1986.)

5-40-11. Alternative requirements for approval to construct a dam. Construction or modification of a dam shall be approved by the chief engineer with any permit conditions necessary to protect life, property, and public safety if both of the following conditions are met:

(a) The applicant applies for prior written consent or a permit to build or modify a dam.

(b) The proposed dam or modification of a dam does not meet one or more of the hydrologic and engineering requirements of K.A.R. 5-40-9 and K.A.R. 5-40-10, but the applicant demonstrates to the chief engineer, based on sound hydrologic and engineering principles, that the proposed dam, or modification of a dam, will not endanger life, property, and public safety if it is constructed or modified in accordance with the submitted plans and specifications. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-302 and 82a-303; effective Sept. 22, 2000.)

5-40-12. As built drawings. Following

completion of all class (c) high hazard dams, within 90 days, or within any authorized extension of time, the applicant shall submit as built drawings prepared by a person authorized to prepare the original plans and specifications pursuant to K.A.R. 5-40-4. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective May 1, 1987.)

5-40-13. Safety inspections. Following the completion of construction of any class (c) high hazard dam, the owner shall have a dam safety inspection conducted by a licensed professional engineer and have the report submitted to the division of water resources. Inspections shall be conducted at five-year intervals, or more frequently if specifically requested by the chief engineer. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective May 1, 1987.)

5-40-14. Testing a principal spillway pipe installation in a dam; applicability. (a) For the purpose of testing the leakage rate of principal spillway pipe installation in a dam, an applicant shall conduct a static pressure test of each principal spillway installation constructed of corrugated metal pipe.

(b) A static pressure test shall be required only of a principal spillway installation made of corrugated metal pipe, unless the chief engineer determines that testing principal spillway pipe made of other materials or testing other pipes used in the construction of dams is necessary to protect public safety, life, or property. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303b; effective Sept. 22, 2000.)

5-40-15. Testing a principal spillway pipe installation in a dam; general procedures. The following general procedures shall apply to all static pressure tests required by K.A.R. 5-40-14: (a) The applicant shall conduct the test before backfilling around and over the principal spillway pipe and after laying the pipe on the grade line and connecting the pipe according to the approved plans and the manufacturer's requirements.

(b) The applicant, the applicant's representative, or the contracting officer shall make arrangements for the chief engineer, or a person designated by the chief engineer, to be present during the test.

(c) The applicant shall place a watertight plug in the downstream end of the pipe. The plug shall be sufficient to withstand a pressure of three pounds per square inch for the duration of the test. The plug shall be equipped with an acceptable means of draining the water out of the pipe after completion of the test.

(d) The applicant shall fill the pipe with water up to an elevation of 10 feet above the flow line at the pipe outlet, or up to the principal spillway inlet elevation, whichever is less, unless a different elevation is required by the test method described in K.A.R. 5-40-16(b).

(e) The applicant shall note the exact elevation of the water surface at the time the test begins. At the end of the prescribed test duration, the applicant shall measure the water surface elevation.

(f) The applicant shall use one of the test methods described in K.A.R. 5-40-16 to determine whether the water leakage rate is acceptable.

(g) If the leakage rate determined by either of the methods described in K.A.R. 5-40-16 is not acceptable, the applicant shall determine the source of the leakage and correct the leakage. After correction, the applicant shall perform another test in accordance with K.A.R. 5-40-15 and K.A.R. 5-40-16.

(h) If the leakage rate determined by either of the methods described in K.A.R. 5-40-16 is acceptable, the applicant shall drain and backfill the pipe in the manner prescribed by the approved plans and specifications. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303b; effective Sept. 22, 2000.)

5-40-16. Testing a principal spillway pipe installation in a dam; allowable leakage rate, test methods. The allowable leakage rate for a principal spillway pipe installation in a dam shall not exceed 1,000 gallons per inch diameter of pipe per mile of pipe per day. The applicant shall use one of the following test methods in determining whether the allowable leakage rate has been exceeded:

(a) The applicant shall use the following test method procedure for a drop inlet structure if the starting and ending elevation of the water is within the vertical drop structure and above the top of the barrel:

(1) Calculate the allowable leakage rate in gallons per minute for the pipe being tested based on the following formula:

The allowable leakage rate in gallons per minute = $0.000132 \times d \times l$ where:

d = diameter of the tested pipe in inches
l = length of the tested pipe in feet

If the allowable leakage rate in gallons per minute is determined to be less than one, then it shall be assumed for the purposes of the test that the allowable leakage rate in gallons per minute is one.

(2) Conduct the test for 15 minutes.

(3) If the allowable leakage rate is one gallon per minute, the applicant may use the following table to determine the allowable drop in the elevation of the water in the riser.

Nominal diameter of riser (inches)	Allowable drop (feet)
18	1.13
20	0.83
24	0.64
30	0.41
36	0.28

(4) If the measured drop in the riser exceeds the corresponding allowable drop in paragraph (a)(1) above, the allowable leakage rate has been exceeded, which shall not be acceptable. If the measured drop in the riser is less than or equal to the corresponding allowable drop in paragraph (a)(1) above, the allowable leakage rate has not been exceeded and shall be acceptable.

(b) The applicant shall use the following test method procedure for all other types of installations, including canopy inlets:

(1) If filling the pipe with water up to an elevation of 10 feet above the outlet puts water within the vertical riser below the top of the barrel, the elevation shall be reduced below the bottom of the vertical riser before the test begins.

(2) The allowable drop in elevation is a function of the allowable leakage rate, test duration, and the diameter and slope of the pipe. The allowable drop in the pipe in feet shall be calculated by use of the following formula:

$$\frac{\text{allowable rate (gallons per minute)} \times \text{test duration (minutes)} \times \text{slope (\%)}}{[\text{diameter (inches)}]^2 \times 4.08}$$

(3) The minimum test duration shall be 15 minutes. If the above formula results in an allowable drop of less than 0.1 foot in 15 minutes, the test duration shall be extended so that the allowable drop is greater than 0.1 feet.

(4) The water surface elevation drop shall be measured by means of a clear plastic tube installed in the plug at the downstream end of the principal spillway pipe. Any other means of measuring the drop in elevation shall be approved by the chief engineer in advance of the test.

(5) If the measured drop is greater than the allowable drop as calculated in paragraph (b)(2), the allowable leakage rate has been exceeded, which shall not be acceptable. If the allowable drop is less than or equal to the allowable drop as calculated in paragraph (b)(2), the allowable leakage rate has not been exceeded, which shall be acceptable. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303b; effective Sept. 22, 2000.)

Article 41.—DESIGN OF CHANNEL CHANGES

5-41-1. Channel changes; plans and specifications. Plans for a channel change shall include the following: (a) A general location map or aerial photograph, showing the present alignment of the stream, location of the proposed channel change, section lines, property lines with names and addresses of adjoining landowners, drainage area, a north arrow, a bar scale, and any other prominent features;

(b) a detailed plan view of the project with stationing shown, including as many other views as necessary to fully describe the project;

(c) a profile drawing along the centerline of the proposed new channel. This profile shall extend five times the channel width upstream and an equivalent distance downstream from each end of the new channel. The stationing shown on the plan view shall correspond to stationing on the profile drawing. This drawing shall show the present ground surface, the present stream bed, and the grade line of the proposed new channel;

(d) cross sections of the existing stream at locations immediately above and below the proposed channel change. The location of these cross sections shall be described and shown on the plans. The elevations of the top of the existing banks and bottom of the channel shall be shown;

(e) at least one permanent bench mark conveniently located for use after construction, except for grassed waterways constructed for the purpose of conveying runoff without causing erosion or flooding. The location, description, and elevation of the permanent bench mark, to which all elevations are referred, shall be shown on the plans. The designer shall reference the project bench mark to the current national geodetic vertical datum, to a tolerance of plus or minus ½ foot on all channel

changes involving perennial streams and where detailed floodplain data are available. Project datum shall be acceptable on all other channel changes; and

(f) a cross-sectional drawing of the proposed new channel, including dimensions. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-302; effective May 1, 1987; amended Sept. 22, 2000.)

5-41-2. Channel changes; water velocity. The new channel shall have a conveyance capacity equal to or greater than the old channel. The water velocity after the completion of the proposed channel change or stream obstruction shall not exceed a permissive velocity. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective May 1, 1987.)

5-41-3. Channel changes; side slopes. The side slopes of the proposed new channel shall not be steeper than one foot vertical to two feet horizontal unless the applicant submits data and analysis to show that a steeper slope will be stable. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective May 1, 1987.)

5-41-4. Channel changes; construction by erosion. New channels shall not be constructed by erosion. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective May 1, 1987.)

5-41-5. Channel changes; disposal of excavated material. (a) Material removed from the newly excavated channel shall be deposited at a location and in a form acceptable to the chief engineer. If the material is to be deposited so that it will have the effect of a levee, a separate prior written approval of the chief engineer is required pursuant to K.S.A. 24-126.

(b) Filling or plugging the original channel shall receive the prior written approval of the chief engineer. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective May 1, 1987.)

5-41-6. Channel changes; vegetative strips on new channels. On each new channel project, except a grassed waterway constructed for the purpose of conveying runoff without causing erosion or flooding, a vegetative strip shall be established and maintained for a width of 50 feet immediately adjoining the channel on each side of the stream if site conditions permit, unless an acceptable engineering design shows that a greater or lesser width of vegetative strip is preferable. The general type of vegetation shall be approved by the chief engineer. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective May 1, 1987; amended Sept. 22, 2000.)

Article 42.—DESIGN OF STREAM OBSTRUCTIONS

5-42-1. Stream obstructions; plans and specifications. Plans for a stream obstruction shall include: (a) A general location map or aerial photograph showing the stream, location of the proposed obstruction, section lines, a bar scale, a north arrow, property lines with names and addresses of adjoining landowners, and any other landowners whose land may be hydraulically affected by the proposed stream obstruction, drainage area and any other prominent features;

(b) a detailed plan view fully describing the obstruction and the site;

(c) a profile showing the present elevation of the stream bed and both banks, extending upstream to the point where the stream bed elevation is equal to or higher than the top of the obstruction and extending downstream an equivalent distance from the project site;

(d) an elevation view showing the obstruction on a cross section of the stream and the valley up to the post project design flood elevation at the site;

(e) at least one permanent benchmark shall be conveniently located for use after construction. The location, description and elevation of the permanent benchmark, to which all elevations are referred, shall be shown on the plans. Reference to the national geodetic vertical datum of 1988, or other acceptable national vertical datum, to a tolerance of plus or minus one half foot is required for all stream obstructions on perennial streams and where detailed floodplain data are available. Project datum is acceptable on all other stream obstruction projects;

(f) details of the manner in which the obstruction is to be tied into the bed and banks of the streams;

(g) the land for which easements or rights-of-way are to be acquired if the proposed obstruction affects land other than that owned by the applicant; and

(h) unless it is clear that the impacts of the proposed project will be contained within the channel or limited to property under the control of the

applicant, a hydraulic analysis determining the pre-project and post-project water surface elevations for the two-year flood and the 100-year flood shall be prepared and submitted to the chief engineer. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-302; effective May 1, 1987; amended, T-5-12-30-91, Dec. 30, 1991; amended April 27, 1992.)

5-42-2. Stream obstruction; minor. If a proposed stream obstruction will not decrease the cross sectional area of a stream channel at the location of the obstruction by more than 15 percent, the plans required by the chief engineer shall be equivalent to the type submitted to the United States corps of engineers with applications for a department of the army permit. Such obstructions shall include weirs, causeways, low-water crossings, low-head dams, intake structures, boat launching ramps, pipeline crossings, outfall structures, marinas, boat docks, jetties and revetments. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective May 1, 1987.)

5-42-3. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective May 1, 1987; amended April 27, 1992; revoked Sept. 22, 2000.)

5-42-4. Stream obstruction; temporary structure. A temporary structure shall not require a stream obstruction permit from the chief engineer pursuant to K.S.A. 82a-301 et seq. and amendments thereto if it meets all of the following criteria:

(a) The structure is temporary in nature.

(b) The structure is constructed only of temporary materials, including local streambed materials, straw or hay bales, plastic, or plywood, that are likely to wash out during a bank-full storm event.

(c) The structure is actively maintained only during the duration of the temporary beneficial use.

(d) The structure is less than two feet in height above the natural bed of the stream, and alterations to the stream and alterations to the stream bank are no more than are necessary for permitting access to the site for operation and maintenance.

(e) The structure is below the natural low bank of the stream.

(f) Any water backed up by the structure is detained solely on property under the control of the landowner that constructed the temporary structure.

(g) The structure does not materially adversely affect the public interest, public safety, or environment. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective Sept. 22, 2000.)

Article 43.—SAND DREDGING PERMITS

5-43-1. Sand dredging operation; plans and specifications. Plans for a sand dredging operation from a stream shall include: (a) A general location map or aerial photograph showing the stream, location of the proposed sand dredging operation, section lines, property lines with names and addresses of adjoining landowners, local access roads, a bar scale, a north arrow and any other prominent features;

(b) a plat of the area within which the sand plant will be operated, prepared to a scale of 200 feet per inch, or less, if necessary to show in detail the features of the stream at the location. The plat shall include at least one permanent bench mark. The survey shall also include at least two permanent horizontal control points on a baseline running generally parallel to the stream. These permanent points shall be identified with substantial markers and shall be easily visible in the field. The plat shall show the location of the natural banks on both sides of the stream, all islands, sand bars, and the direction of the stream within the channel. Where county commissioners have established bank lines along a stream in accordance with the provisions of K.S.A. 82a-307a, the location of such established bank lines shall be shown. The plat shall also show the proposed location of the tipple, boundaries of areas from which material will be removed and the area to which rejected material will be returned;

(c) cross sections of the channel, measured along lines at right angles to the general direction of the stream and plotted to a horizontal scale of not more than 200 feet per inch and an appropriate vertical scale. Typical cross sections shall be shown for unobstructed portions of the channel as well as for portions in which islands, sand bars or other obstructions may be located. The elevation of the top of both banks, the bed of the stream, and the surface of islands and bars shall be shown on the cross sections. The location of lines along which cross sections are measured shall be referred to the baseline and indicated on the plat. All elevations shall be referred to a per-

manent bench mark, which is referenced to the national geodetic vertical datum of 1929 to a tolerance of plus or minus one half foot; and

(d) a statement of plan of operation. A brief paragraph shall be included explaining the plants usual operating plans. The kind of equipment, pumping capacities, seasonal limitations and any other operational constrictions shall be included. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-302; effective May 1, 1987.)

5-43-2. Sand dredging; buffer zone. There shall be a buffer zone of not less than 500 feet between dredging operations, and between dredging operations and all bridges. There shall be a buffer zone of 300 feet between dredging operations and buried pipeline or cable crossings. There shall be a buffer zone of 200 feet between dredging operations and levees, or other features subject to damage by undercutting. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective May 1, 1987.)

5-43-3. Sand dredging; operation. In counties at locations where bank lines have been established on designated streams pursuant to K.S.A. 82a-307, materials shall be removed only between established bank lines. The chief engineer, for good cause, may allow excavation or removal of material landward from established bank lines if approval is also obtained from the board of county commissioner. On navigable streams materials shall be removed only from the channel and in such a manner so as not to degrade the banks. On all other streams, materials shall be removed only from areas and in a manner approved by the chief engineer. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective May 1, 1987.)

5-43-4. Sand dredging; operations conflicting. If more than one operator proposes to operate within a given reach of a private stream, then all conflicting applicants shall be required to submit proof of easements or other legal authority to operate. If more than one operator proposes to operate within a given reach of a navigable stream, the chief engineer shall determine which operators shall be permitted, based on the following criteria: (a) The capability of the applicant's equipment to operate within the desired area;

(b) the applicant's need for the material;

(c) the applicant's existing operation, if any;

(d) the anticipated date the applicant will begin operation;

(e) the applicant's history of operation;

(f) the anticipated plant completion date;

(g) proof of the applicant's easements and right-of-ways necessary to operate;

(h) date of application; and

(i) any other relevant factor. (Authorized by K.S.A. 82a-303a; implementing K.S.A 82a-302; effective May 1, 1987.)

5-43-5. Sand dredging; operation setback. Sand dredging operations located outside the channel of a stream shall be set back a minimum of 50 feet from the bank of the channel. There shall be a minimum slope on the sand plant side of not greater than one foot vertical to four feet horizontal. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective May 1, 1987.)

Article 44.—FLOODPLAIN MANAGEMENT

5-44-1. Floodplain management; definitions. As used in these regulations, K.S.A. 12-766, and by the division of water resources in administering K.S.A. 12-766, unless the context clearly requires otherwise, the following words and phrases shall have the meaning ascribed to them in this section: (a) "Basement" means any area of a building having its floor subgrade (below ground level) on all sides.

(b) "Chief engineer" means the chief engineer of the division of water resources, Kansas state board of agriculture.

(c) "Development" means any man-made change to real estate, including, but not limited to:

(1) buildings or other structures;

(2) mining;

(3) dredging;

(4) filling;

(5) grading;

(6) paving;

(7) excavation or drilling; or

(8) storage of equipment or materials.

(d) "Flood or flooding" means a general and temporary condition of partial or complete inundation of normally dry land from:

(1) the overflow of waters normally confined between the banks of a stream or other watercourse, or

(2) the unusual, rapid accumulation or runoff of surface waters from any source.

(e) "Regulatory floodway" means the channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than one foot.

(f) "Lowest floor" means the lowest enclosed area, including a basement, of a building. An unfinished or flood resistant enclosure usable solely for parking of vehicles, building access or storage in an area other than a basement is not considered a building's lowest floor.

(g) "Permit" means a signed document from a designated community official authorizing development in a floodplain, including all necessary supporting documentation such as:

(1) the site plan;

(2) an elevation certificate; and

(3) any other necessary or applicable approvals or authorizations from local, state or federal authorities.

(h) "Structure" means a walled and roofed building, a manufactured house, or above ground gas or liquid storage tank.

(i) "Substantially improved" means any reconstruction, rehabilitation, addition to or other improvement of a structure, the cost of which equals or exceeds 50% of the market value of the structure before the improvement.

(j) "Variance" means a grant of relief by a community from the terms of a floodplain management zoning regulation.

(k) "Flood hazard map" means the document adopted by the governing body showing the limits of:

(1) the floodplain;

(2) the floodway;

(3) streets;

(4) stream channel; and

(5) other geographic features.

(Authorized by and implementing K.S.A. 12-766; effective, T-5-12-30-91, Jan. 1, 1992; effective Feb. 17, 1992.)

5-44-2. Floodplain management; conditions for application for approval. Before formal adoption by the governing body of any zoning regulation that establishes a floodplain zone or district, or regulates the development within a floodplain zone or district, the governing body shall apply to the chief engineer for approval of the zoning regulations. The governing body shall also apply to the chief engineer for approval of its zoning regulation when: (a) the governing body enters into, or alters its status under, the national flood insurance program;

(b) the governing body adopts a new or revised flood hazard map, base flood elevations, flood insurance study, or regulatory floodway;

(c) the governing body annexes areas containing floodplain;

(d) the governing body assumes administrative jurisdiction over the adjacent floodplain areas outside the governing body's boundaries; or

(e) the governing body changes variance procedures used in granting relief from floodplain regulations. (Authorized by and implementing K.S.A. 12-766; effective, T-5-12-30-91, Jan. 1, 1992; effective Feb. 17, 1992.)

5-44-3. Floodplain management; application for approval of zoning regulations; time limit. (a) The application for approval of zoning regulations shall consist of:

(1) a letter which:

(A) requests approval by the chief engineer under K.S.A. 12-766 on a proposed effective date, which shall not be prior to the approval by the chief engineer;

(B) proposes the date of adoption by the governing body; and

(C) states the reason for application for approval as enumerated in K.A.R. 5-44-2;

(2) a copy of the full text of the zoning regulation including maps, plans, profiles and specifications adopted by the floodplain management zoning regulations which meet the requirements of K.A.R. 5-44-4.

(b) When all the data required by the chief engineer is received, the chief engineer shall notify the governing body in writing as to the beginning and ending dates of the 90 day statutory time period for review. (Authorized by and implementing K.S.A. 12-766; effective, T-5-12-30-91, Jan. 1, 1992; effective Feb. 17, 1992.)

5-44-4. Floodplain management; zoning regulations; minimum standards and criteria. Any zoning regulation which regulates development of floodplains shall include the following minimum standards and criteria: (a) Flood hazard areas shall be identified as follows:

(1) The flood hazard area subject to floodplain management zoning regulation shall be identified by reference to a specific map used to identify the

flood hazard. The identification of the map shall include the preparer of the map and the date it was prepared.

(2) When the flood hazard map is revised and republished with a new effective date, the governing body's floodplain management zoning regulations shall amend the zoning regulations to adopt the new map by reference.

(b) The development standards shall meet or exceed the minimum requirements of the national flood insurance act of 1968, as amended, 42 U.S.C. Section 4001 *et seq.* and the regulations adopted pursuant to that act.

(c) Any development standards adopted by the governing body for which minimal requirements have been set by the chief engineer in K.A.R. 5-45-1 *et seq.* shall meet or exceed the requirements of the chief engineer.

(d) The governing body shall designate a local floodplain administrator by position or job title. The local floodplain administrator's responsibilities shall include:

(1) the review and issuance of floodplain development permits;

(2) the conduct or direction of appropriate inspections;

(3) the maintenance of any records necessary to document compliance with floodplain development permit conditions; and

(4) any other matters deemed appropriate by the governing body.

(e) The governing body shall designate by position or job title an enforcement officer who is responsible to enforce the actions of the local floodplain administrator.

(f) The local floodplain administrator and enforcement officer may be combined in a single position or job title.

(g) If any part of a proposed development is located within the floodplain, an application for floodplain development permit shall be made to the local floodplain administrator. The application for a floodplain development permit shall contain:

(1) Sufficient detail for the local floodplain administrator to determine the nature of proposed development and whether permits or approvals are needed from the governing body, state or federal authorities, especially any permits or approvals that may be required by K.S.A. 24-126 or K.S.A. 82a-301 *et seq.* and their respective regulations; and

(2) Written documentation of adequate protection from damages which could be caused by the base flood.

(h) If the proposed residential development will be located in an area designated as zone AO on a flood insurance rate map (FIRM), any new or substantially improved residential structure shall have the lowest floor (including the basement) elevated above the highest adjacent natural grade at least as high as the depth number specified in feet on the FIRM. If no depth number is specified on the FIRM, it shall be elevated at least two feet above the highest adjacent natural grade.

(i) If the proposed non-residential development will be located in an area designated as zone AO on a FIRM, any new or substantially improved non-residential structure shall be dry flood proofed or elevated to at least as high as the depth number specified in feet on the FIRM above the highest adjacent natural grade. If no depth number is specified on the FIRM, it shall be dry flood proofed or elevated at least two feet above the highest adjacent natural grade.

(j) If zone AO is not specified on the FIRM, or the proposed development will be located in the floodplain outside zone AO, then the lowest floor of any new or substantially improved residential structure shall be elevated at least one foot above the base flood elevation. The elevation of the lowest floor shall be certified by a licensed land surveyor.

(k) If zone AO is not specified on the FIRM, or the proposed development will be located in the floodplain outside zone AO, then any new or substantially improved non-residential structure shall be dry flood proofed or elevated to at least one foot above the base flood elevation. The elevation of the lowest floor shall be certified by a licensed land surveyor. If the structure is dry flood proofed, a licensed architect or a licensed professional engineer shall certify that the design and methods of construction of the dry flood proofing meet or exceed the minimum requirements of the national flood insurance act of 1968, as amended, 42 U.S.C. Section 4001 et seq. and the regulations adopted pursuant to that act. (Authorized by and implementing K.S.A. 12-766; effective, T-5-12-30-91, Jan. 1, 1992; effective Feb. 17, 1992.)

5-44-5. Floodplain management; variance procedures. Any floodplain management zoning regulations shall include procedures for the approval of a variance to the floodplain management zoning regulations. The procedures shall

stipulate the criteria for a variance and specify when a variance may be granted by the local floodplain administrator, the enforcement officer or board of zoning appeals. The procedures shall establish a board of zoning appeals for hearing appeals of decisions of the floodplain administrator or enforcement officer and establish the criteria for the appeals. Variances shall not be granted solely to avoid the requirements of a floodplain development permit. (Authorized by and implementing K.S.A. 12-766; effective, T-5-12-30-91, Jan. 1, 1992; effective Feb. 17, 1992.)

5-44-6. Floodplain management; waiver or stricter requirements. (a) The chief engineer may waive any of the regulations adopted under this article if it is shown to the satisfaction of the chief engineer that waiver of the regulation will not pose a hazard to the public safety and that such waiver is not adverse to the public interest.

(b) The chief engineer may invoke any jurisdiction granted by statute to impose stricter requirements than those required by rules and regulations where such jurisdiction or additional requirements are necessary to protect the public interest, protect the public safety or prevent damage to public or private property. (Authorized by and implementing K.S.A. 12-766; effective, T-5-12-30-91, Jan. 1, 1992; effective Feb. 17, 1992.)

Article 45.—DESIGN OF LEVEES

5-45-1. Levees and floodplain fills; definitions. As used in K.S.A. 24-126 and amendments thereto, in the regulations adopted pursuant thereto, and by the division of water resources in administrating K.S.A. 24-126, unless the context clearly requires otherwise, the following words and phrases shall have the meaning ascribed to them in this regulation: (a) "Approval" means the written approval of plans and specifications by the chief engineer authorizing the applicant to proceed with the construction and maintenance of a levee or floodplain fill project.

(b) "Authorized representative" means any staff employee designated by the chief engineer to perform duties and functions on behalf of the chief engineer.

(c) "Base flood" means a flood having a one percent chance of being equaled or exceeded in any one year.

(d) "Chief engineer" means the chief engineer, division of water resources, Kansas department of agriculture.

(e) "Design flood" means a flood having a selected probability of being equaled or exceeded in any one year for the degree of protection required.

(f) "Environmental mitigation" means any of the following:

(1) Site-specific modification of a project;

(2) implementation of a practice or management; or

(3) the reservation of a part of the project to protect or replace environmental values destroyed or adversely affected by the project.

(g) "Equal and opposite conveyance" means the location of development offsets from stream banks so that floodplain lands on each side of a stream outside the stream channel convey a share of the flood flows proportionate to the total conveyance available on each respective side of the stream.

(h) "Floodplain fill" means material, usually soil, rock, or rubble, that is placed in a floodplain to an average height of greater than one foot above the existing ground and that has the effect of diverting, restricting, or raising the level of floodwaters on a stream.

(i) "Floodway" means the channel of a stream and adjacent land areas that have been determined as being necessary to convey the base flood, as calculated using the minimum requirements of the national flood insurance act of 1968, 42 U.S.C. 4001 et seq., as amended September 23, 1994, and 44 C.F.R. part 59, subpart A, sec. 59.1 and 44 C.F.R. part 60, subpart A, sec. 60.3, as amended October 1, 1998.

(j) "Floodway fill" means floodplain fills, other than a levee, placed wholly or partially within the boundaries of the floodway at locations where the floodway has been identified.

(k) "Floodway fringe" means those portions of a floodplain outside of the boundaries of a regulatory floodway within reaches of a stream where such a floodway has been established.

(l) "Floodway fringe fill" means floodplain fills, other than a levee, placed wholly outside the floodway boundaries at locations where the floodway has been identified.

(m) "Levee" means any floodplain fill with an average height of more than one foot above the surrounding terrain constructed generally parallel to a water course and whose purpose is to repel floodwaters.

(n) "Perennial stream" means a stream, or a part of a stream, that flows continuously during

all of the calendar year, except during an extended drought.

(o) "Stream" means any watercourse that has a well-defined bed and banks, and that has a watershed above the geographic point in question that exceeds the following number of acres:

(1) Zone three: 640 acres for all geographic points within any county west of a line formed by the adjoining eastern boundaries of Phillips, Rooks, Ellis, Rush, Pawnee, Edwards, Kiowa, and Comanche counties;

(2) zone two: 320 acres for all geographic points within any county located east of zone three and west of a line formed by the adjoining eastern boundaries of Republic, Cloud, Ottawa, Saline, McPherson, Reno, Kingman, and Harper counties; and

(3) zone one: 240 acres for all geographic points within any county located east of zone two.

The stream need not flow continuously and may flow only briefly after a rain in the watershed. If the site of the project has been altered so that a determination of whether well-defined bed and banks exist is not possible, it shall be presumed that they did exist if the watershed acreage criteria have been met, unless the owner of the project can conclusively demonstrate that well-defined bed and banks did not exist before the construction of the project.

(p) "Watershed" means all of the area draining toward a selected point on a stream. (Authorized by and implementing K.S.A. 24-126; effective May 1, 1987; amended, T-5-12-30-91, Jan. 1, 1992; amended April 27, 1992; amended Sept. 22, 2000.)

5-45-2. Levees and floodplain fills; plans and specifications. Plans for a levee or a floodplain fill must be submitted on clearly legible prints (maximum size 24 inches by 36 inches) of the original tracings which are capable of reproduction. Plans for a levee or a floodplain fill shall include: (a) A general location map or aerial photograph showing:

(1) the stream;

(2) location of the proposed levee or floodplain fill;

(3) floodway limits where available;

(4) floodplain limits where available;

(5) section lines;

(6) property lines with names and addresses of adjoining landowners and any other landowners whose land may be hydraulically affected by the proposed levee or floodplain fill;

(7) drainage area;

(8) a bar scale;

(9) a north arrow;

(10) existing and proposed surface drainage flow patterns; and

(11) any other prominent features;

(b) a detailed plan view fully describing the levee or floodplain fill and the site, including:

(1) the design flood elevation and frequency;

(2) the base flood or floodplain limits where available;

(3) floodway limits where available;

(4) two-foot ground contours of the levee or floodplain fill and areas with local drainage problems; and

(5) the area reserved for environmental mitigation with a description of any necessary environmental mitigation measures to be implemented, if those measures may affect the hydraulics used to evaluate the project;

(c) a profile showing the proposed elevation of the top and base of the levee or floodplain fill, the design flood, the base flood, the stream bed and both banks;

(d) an elevation view at the most hydraulically restrictive location in the valley affected by the project, showing the levee or floodplain fill on a cross section of the stream and the valley up to the post project base flood elevation at the site. This cross section shall show:

(1) the stream;

(2) floodway limits where available;

(3) floodplain limits where available;

(4) base flood elevation; and

(5) design flood elevation;

(e) at least one permanent benchmark conveniently located for use after construction. The benchmark shall be placed where it is not likely to be destroyed. A three foot minimum length of pipe or steel driven flush with the ground in an area which is unlikely to be disturbed may be used. Wood or plastic stakes, nails or marks in trees shall not be considered as permanent benchmarks. The location and description of the benchmark shall be shown on the plans. They shall be properly referenced so they can be easily found in the field. The location, description and elevation of the permanent benchmark shall be shown on the plans. The benchmark may be a benchmark identified in the community's flood insurance rate map if the benchmark is less than 500

feet from the fill. Reference to the national geodetic vertical datum of 1988, or other acceptable national vertical datum, to a tolerance of plus or minus one half foot is required for all levees and floodplain fills on perennial streams. Reference to a tolerance of 0.05 foot is required where detailed floodplain data are available. Project datum is acceptable on all other levee and floodplain fill projects; and

(f) the land for which easements or rights-of-way have been acquired when the proposed levee or floodplain fill will affect land other than that owned by the applicant. (Authorized by and implementing K.S.A. 1991 Supp. 24-126; effective May 1, 1987; amended, T-5-12-30-91, Jan. 1, 1992; amended April 27, 1992.)

5-45-3. Levees and floodplain fills; specifications. The specifications for levees and floodplain fills shall be prepared on 8½ by 11 inch sheets of a good grade of white bond paper. The specifications shall be in sufficient detail to assure that the works will be properly executed and shall comply with currently accepted engineering practices. The specifications shall include provisions for: (a) adequate supervision during the period of construction by a person qualified to design the levee or floodplain fill;

(b) notification of the division of water resources of the status of construction; and

(c) inspection by a representative of the division of water resources. (Authorized by and implementing K.S.A. 24-126 as amended by L. 1991, ch. 56, sec. 27; effective May 1, 1987; amended, T-5-12-30-91, Jan. 1, 1992; amended April 27, 1992.)

5-45-4. Levees and floodplain fills; preparer of maps, plans, profiles, and specifications. In addition to the requirements of the Kansas board of technical professions, the following requirements shall apply: (a) Each map, plan, profile, and specification submitted to the chief engineer for approval pursuant to K.S.A. 24-126 and amendments thereto shall be prepared by a person who is competent in levee or floodplain fill design and construction.

(b) Map, plans, profiles, and specifications for any of the following described levees and floodplain fills shall be prepared by a licensed professional engineer that is competent in levee or floodplain fill design and construction:

(1) Class C levees;

(2) floodplain fills located in whole or in part in identified floodways; and

(3) floodplain fills that meet the following criteria:

(A) Are located in areas without a designated floodway;

(B) are greater than 3,200 cubic yards in volume;

(C) are more than four feet in height; and

(D) are more than 100 feet from other floodplain fills.

(c) No provision of this regulation, nor any decision made by the chief engineer pursuant to this regulation, shall alter the responsibilities or duties of any licensee of the Kansas board of technical professions to comply with that board's requirements. (Authorized by and implementing K.S.A. 24-126; effective May 1, 1987; amended, T-5-12-30-91, Jan. 1, 1992; amended April 27, 1992; amended Sept. 22, 2000.)

5-45-5. Levees; waiver and stricter requirements. The chief engineer may waive any of the regulations adopted under this article if it is shown to the satisfaction of the chief engineer that the waiver of the regulation will not pose a hazard to the public safety and that the waiver is in the public interest. The chief engineer may also invoke any jurisdiction granted by statute to impose stricter requirements than those required by rules and regulations where such jurisdiction or additional requirements are necessary to protect the public interest, protect the public safety or prevent damage to property. (Authorized by and implementing K.S.A. 24-126; effective May 1, 1987.)

5-45-6. Levees and floodplain fills; other maps, plans, profiles, data and specifications. The applicant shall also submit any other maps, plans, profiles and specifications of the levee or floodplain fill project and any other data which the chief engineer may require. (Authorized by and implementing K.S.A. 24-126 as amended by L. 1991, ch. 56, sec. 27; effective May 1, 1987; amended, T-5-12-30-91, Jan. 1, 1992; amended April 27, 1992.)

5-45-7. Levees and floodplain fills; application. (a) The application for approval of plans to construct a levee or floodplain fill shall be filed on the form(s) prescribed by the chief engineer, including application supplements, and shall be completed in proper form according to

the instructions. To be complete, the application shall include:

(1) application DWR No. 3-100.1;

(2) the application supplement, DWR Form No. 2-102;

(3) plans fully complying with requirements of K.A.R. 5-45-2;

(4) specifications fully complying with requirements of K.A.R. 5-45-3; and

(5) a copy of an application to the governing body for a floodplain development permit, if the proposed levee or floodplain fill will change the limits of the floodplain or floodway boundaries, or both.

(b) The statutory time limit on the chief engineer's deliberation for approval for floodway fringe fills shall not begin until the application is complete. When such a floodway fringe fill application is received by the chief engineer, it will be reviewed to determine whether or not it is complete. If the application is complete, the chief engineer will notify the applicant when the 90-day review period began and will end. If the application is not complete, the additional information will be requested and the applicant informed that the 90-day statutory review period has not yet begun. For a floodway fringe fill application, when comments are received as a result of the water projects environmental coordination act review under K.S.A. 82a-325, et seq., which require modification of the plans, the 90-day statutory time limit shall be suspended from the time the modifications are requested by the chief engineer until satisfactory modifications of the plans are received by the division of water resources. When the appropriate modifications have been received, the 90-day time limit will begin again with the same number of days remaining as were remaining at the time of the suspension. The applicant shall be notified in writing as to the dates of the suspension and restart of the 90-day time limit. (Authorized by and implementing K.S.A. 1991 Supp. 24-126; effective May 1, 1987; amended, T-5-12-30-91, Jan. 1, 1992; amended April 27, 1992.)

5-45-8. Levees; hazard classes. The following levee hazard classes are established: (a) Class A levee—failure of levee may allow damage to farm buildings, limited agricultural grounds or private roads.

(b) Class B levee—failure of levee may endanger extensive agricultural land, or damage isolated homes, secondary highways or minor railroads.

(c) Class C levee—failure of levee may cause loss of life, or cause serious damage to private, commercial or public property. (Authorized by and implementing K.S.A. 24-126; effective May 1, 1987.)

5-45-9. Levees; design storm flow determination. (a) In determining design storm flow magnitude, the applicant shall use an accepted engineering method.

(b) For drainage areas of less than 2 square miles the following methods are acceptable, where appropriate: (1) The rational formula for flow magnitude determination when used according to the following formula:

$$Q = CIA$$

Where C = the runoff coefficient
I = intensity of rainfall in inches per hour and
A = drainage area in acres.

To determine the proper intensity of rainfall for use with the formula, first determine the appropriate total rainfall from "Technical Paper Number 40, Rainfall Frequency Atlas of the United States, *Department of Commerce,* May 1961," and the time of concentration from the Kirpich nomograph and then obtain the intensity from the standard rainfall intensity-duration curves;

(2) The SCS method for estimating direct runoff, United States department of agriculture, soil conservation service;

(3) "Technical Release 55, Hydrology for Urban Areas, *United States Department of Agriculture, Soil Conservation Service."*

(c) For drainage areas two square miles or greater, the following methods of determining flow magnitude shall be acceptable, where appropriate: (1) the publication "Magnitude and Frequency of Floods in Kansas, Unregulated Streams, Technical Report 11, *Kansas Water Resources Board,* February 1975";

(2) "Technical Release 20, Computer Program for Project Formulation, Hydrology, *United States Department of Agriculture, Soil Conservation Service";* or

(3) "HEC-1 Flood Hydrograph Package, *Corps of Engineers Hydrologic Engineering Center."* (Authorized by and implementing K.S.A. 24-126; effective May 1, 1987.)

5-45-10. Levees; design criteria. Design for levees shall meet or exceed the following criteria: (a) Class A levee—the levee shall safely repel the appropriate design storm.

(b) Class B levee—the levee shall safely repel at least the ten year design storm.

(c) Class C levee—the levee shall safely repel at least the 100 year design storm. For class C levees the applicant shall submit complete water surface water profiles of both the ten and 100 year events, both before and after construction. (Authorized by and implementing K.S.A. 24-126; effective May 1, 1987.)

5-45-11. Levees; freeboard requirements. (a) Levees not within a floodway designated by the chief engineer are required to have the following freeboard:

Design flood frequency	*Freeboard required*
10 years	1 foot
25 years	2 feet
50 years or more	3 feet

(b) Levees constructed within a floodway designated by the chief engineer shall have a freeboard requirement designated on a site specific basis. (Authorized by and implementing K.S.A. 24-126; effective May 1, 1987.)

5-45-12. Levees and floodplain fills; setback. Except for highway and road crossings of streams, the minimum setback distance from the top of the stream bank to the nearest toe of the levee or the edge of the floodplain fill shall be 100 feet, or twice the width of the stream measured from the top of one bank to the top of the opposite bank, whichever distance is less, unless the applicant demonstrates that adequate bank protection will be utilized. (Authorized by and implementing K.S.A. 1991 Supp. 24-126; effective May 1, 1987; amended, T-5-12-30-91, Jan. 1, 1992; amended April 27, 1992.)

5-45-13. Levees; floodplain fills; unreasonable effect. (a) Except as set forth in subsection (b), no plans for any levee or floodplain fill that has an unreasonable effect on another shall be approved by the chief engineer. An unreasonable effect caused by a levee or floodplain fill shall be deemed any of the following:

(1) An increase in the elevation of the design and base flood profiles of more than one foot at any location outside a floodway;

(2) any increase in the elevation of the design and base flood profiles within a floodway; or

(3) a cumulative increase of more than one foot in the elevation of the design and base flood profiles.

(b) A levee or floodplain fill that has an unreasonable effect on another may be approved by the chief engineer subject to any conditions necessary to protect the public interest if either of the following criteria is met:

(1) The applicant demonstrates to the chief engineer that the applicant has obtained legal authorization from any landowner whose land is unreasonably hydraulically affected by a greater increase in the elevation of the design and base flood profile.

(2) The following conditions are met:

(A) The owner of the undeveloped, unplatted land that will be hydraulically affected by an increase in the design and base flood profiles of more than one foot by a federal or state cost-shared roadfill, bridge, or culvert replacement project has been notified of the proposed hydraulic effects by the chief engineer.

(B) The owner has failed to object within the time limit set forth in the notice.

(C) The chief engineer determines that the increase will not be likely to materially damage the private or public property. (Authorized by and implementing K.S.A. 24-126; effective May 1, 1987; amended, T-5-12-30-91, Jan. 1, 1992; amended April 27, 1992; amended Sept. 22, 2000.)

5-45-14. Levees and floodplain fills; hydrologic and hydraulic analysis. (a) The applicant shall submit a hydrologic and hydraulic analysis for every levee and floodplain fill project except floodway fringe fill projects and those levee projects and floodplain fill projects not identified in K.A.R. 5-45-4(b). The hydrologic and hydraulic analysis shall include the design and base floods for main streams, tributary streams, and local drainage, describing the existing and proposed conditions with the application and plans.

(b) The effect of a proposed levee or floodplain fill shall be calculated by the technique of equal conveyance reduction, except as provided in subsections (c) and (d), unless it meets either of the following criteria:

(1) The applicant demonstrates that the applicant has obtained legal authorization from any landowner whose land is unreasonably hydraulically affected by a greater encroachment toward the channel.

(2) The following conditions are met:

(A) The owner of the undeveloped, unplatted land that will be hydraulically affected by an increase in the elevation of the base flood profile of more than one foot by a federal or state cost-

shared roadfill, bridge, or culvert project has been notified of the proposed hydraulic effects by the chief engineer.

(B) The owner has failed to object within the time limit set forth in the notice.

(C) The chief engineer determines that the increase will not be likely to materially damage the private or public property.

(c) For a class A or class B levee, the effect of the proposed levee on the design flood profile shall be evaluated with the assumption that an equal setback levee is in place on the opposite side of the stream.

(d) For a class C levee, the effect of the proposed levee on the design flood profile shall be calculated by the technique of equal conveyance reduction from the outer floodplain limits outside the channel, unless the applicant demonstrates that the applicant has obtained legal authorization from all landowners whose land would be unreasonably hydraulically affected by a greater encroachment toward the channel. (Authorized by and implementing K.S.A. 24-126; effective, T-5-12-30-91, Jan. 1, 1992; effective April 27, 1992; amended Sept. 22, 2000.)

5-45-15. Floodplain fills; design criteria. Floodplain fills shall meet or exceed the following design criteria: (a) the sideslopes shall not be steeper than one vertical to three horizontal, unless the applicant submits data and analysis to show that a steeper slope will be stable.

(b) Floodplain fills shall be adequately protected from erosion and undermining from floods up to the level of the base flood elevation and surface drainage by the use of vegetative cover, riprap or other means.

(c) Floodplain fills shall not unreasonably obstruct or divert the flow of surface water and other waters from the main stream and tributaries to the main stream to the detriment of adjacent or hydraulically affected property owners.

(d) Floodplain fills shall not obstruct utility or other easements without proper authorization.

(e) Floodplain fills shall not unreasonably affect the environment without adequate environmental mitigation.

(f) Floodplain fills, other than levees, for residential buildings, including manufactured housing, are required to be of adequate height to raise the lowest floor, including the basement, at least one foot above the base flood elevation, unless:

(1) an exception has been granted by the flood insurance administrator of the flood insurance administration within the FEMA for the allowance of a basement; or

(2) the chief engineer has approved a community standard at or above base flood elevation.

(g) Floodplain fills other than levees for sewage lagoons and sanitary landfills are required to have at least one foot of freeboard above the base flood.

(h) Except for fills for highways and roads, all other floodplain fills other than levees are required to have at least one foot of freeboard above the design flood.

(i) If subsequent to approval of the floodplain fill by the chief engineer, a letter of map revision or letter of amendment is obtained from FEMA removing an area of the approved or permitted fill from the floodplain, then any permit or approval issued by the chief engineer no longer applies to that area removed from the floodplain. (Authorized by and implementing K.S.A. 1991 Supp. 24-126; effective, T-5-12-30-91, Jan. 1, 1992; effective April 27, 1992.)

5-45-16. Floodplain fills; disapproval. (a) A levee or floodplain fill should not have an unreasonable effect on adjacent landowners, be adverse to the public interest and environmental concerns or lack required environmental mitigation.

(b) Within six months of the disapproval, the applicant may make a written request to the chief engineer to rescind the disapproval by providing information or modifications of the plans requested by the chief engineer. (Authorized by and implementing K.S.A. 24-126 as amended by L. 1991, ch. 56, sec. 27; effective, T-5-12-30-91, Jan. 1, 1992; effective April 27, 1992.)

5-45-17. Exemption—floodway fringe fills. Floodway fringe fills are exempt from applying for and obtaining approval from the chief engineer if: (a) they are:

(1) up to 1600 cubic yards in size;

(2) with a maximum height of two feet;

(3) more than 100 feet away from any other floodplain fills; and

(4) constructed according to the design criteria in K.A.R. 5-45-15; or

(b) they are located in communities which have adopted local standards for floodway fringe fills approved by the chief engineer which meet or exceed the standards adopted by the chief engineer for individual floodway fringe fills. The standards shall include an appeal process, an environmental

assessment and a review of local drainage. (Authorized by and implementing K.S.A. 1991 Supp. 24-126; effective, T-5-12-30-91, Jan. 1, 1992; effective April 27, 1992.)

5-45-18. Floodplain fills; incidental to bridge and culvert replacement projects. Each floodplain fill constructed incidental to a bridge or culvert replacement project that otherwise meets the requirements of K.A.R. 5-46-1 shall be considered to have the necessary approval of plans pursuant to K.S.A. 24-126, and amendments thereto, and article 45 of the rules and regulations adopted by the Kansas department of agriculture, division of water resources. (Authorized by and implementing K.S.A. 24-126; effective Sept. 22, 2000.)

Article 46.—GENERAL PERMITS

5-46-1. General permits; bridge and culvert replacement projects. (a) Except as provided in subsection (e), the construction of any bridge or culvert replacement project with a watershed of 2,560 or more acres in zone one, 3,840 or more acres in zone two, and 5,120 or more acres in zone three shall meet the criteria in subsection (c) of this regulation. Before construction, the applicant shall apply for and obtain a general permit from the chief engineer. The application shall be filed on a form prescribed by the chief engineer and shall be accompanied by plans or sketches meeting the requirements of K.A.R. 5-42-2.

(b) Except as provided in subsection (e), the construction of any bridge or culvert replacement project with a watershed of fewer than 2,560 acres in zone one, 3,840 acres in zone two, and 5,120 acres in zone three shall meet the criteria in subsection (c) of this regulation. Before construction, the applicant shall properly complete an application for, and receive the consent of, the chief engineer. The application shall be filed on a form prescribed by the chief engineer.

(c) Each bridge replacement and culvert replacement project shall meet all of the following criteria:

(1) The project shall not be a change either in alignment or in the cross section of a stream of more than 200 feet in length on minor streams, and not more than 400 feet in length on moderate or major streams as measured along the original channel. A minor stream is defined as a stream or watercourse that has a mean annual flow of less than five cubic feet per second (cfs). The major streams are the Kansas River, the Arkansas River, and the Missouri River. A moderate stream is defined as a stream or watercourse with a mean annual flow equal to or greater than five cfs, but is not a major stream.

(2) The proposed culvert or bridge replacement shall have the following:

(A) A cross-sectional area at least equivalent to that of the original bridge or culvert for water to flow over, through or around; and

(B) a road grade across the floodplain and approaching the bridge or culvert that is not raised by more than an average of one foot. The average rise of the road grade shall be calculated by measuring the difference between the proposed grade and the existing grade at the beginning and end of each interval of 100 or fewer feet, dividing the sum of the two differences by two and multiplying the mean by the number of feet in the interval. The sum of these calculations from each interval shall then be added together and the total sum divided by the length, in feet, of the road alteration. The average road grade shall not increase by a cumulative amount of more than one foot since April 11, 1978.

(3) A vegetative strip measuring 50 feet from the bank and outward on each side of a channel change shall be maintained in a manner consistent with the existing riparian vegetation and other design criteria.

(4) The project shall not alter the channel's cross-sectional area by more than 15 percent, nor shall it alter the channel length by more than 10 percent.

(d) If any bridge or culvert replacement project does not meet the requirements of this regulation, the applicant may apply for a nongeneral permit pursuant to K.S.A. 82a-301 et seq., and amendment thereto, before construction.

(e) If any bridge or culvert replacement project does not meet the requirements of this regulation or the chief engineer determines that the project may have an unreasonable effect on the public interest, public safety, or environmental interests, the right to perform the following shall be reserved by the chief engineer:

(1) Require a general permit meeting the requirements of this regulation or a nongeneral permit meeting the requirements of K.S.A. 82a-301 et seq., and amendment thereto, before construction; and

(2) amend, modify, or revoke the prior general

permit or consent issued in accordance with this regulation. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective Sept. 22, 2000.)

5-46-3. General permits; sand and gravel removal operations. (a) Before the commencement or continuation of any sand or gravel removal from a site with a drainage area of 50 or more square miles above the site, the removal operation shall meet the criteria in subsection (c) of this regulation. Before the removal of any sand and gravel, the owner shall apply for and obtain a general permit from the chief engineer. The application shall be filed on a form prescribed by the chief engineer and shall be accompanied by plans meeting the requirements of K.A.R. 5-42-2.

(b) If the proposed sand or gravel removal operation meets the criteria set forth in subsection (c) of this regulation and there are fewer than 50 square miles of drainage area above the proposed sand or gravel removal site, a permit shall not be required unless the chief engineer determines that a permit is necessary to protect the public interest, public safety, or environmental interests.

(c) All sand and gravel operations covered by this regulation shall meet the following criteria:

(1) The sand and gravel removal operation shall be limited to removing a maximum of 100 cubic yards per year from each sand and gravel removal site. Other than bridge maintenance sites, all sand and gravel removal operations on the same stream and its tributaries shall be separated by at least 1,320 feet.

(2) A sand and gravel removal operation shall not be located within the following distances of a bridge, pipeline, cable crossing, levee, or other feature, except when the written permission or easement of the owner of the bridge, pipeline, cable crossing, levee, or other feature is obtained by the applicant, and a written waiver is granted by the chief engineer:

(A) 50 feet of the banks, or in the channels of the Missouri, Kansas, or Arkansas rivers, and 50 feet of the banks, or in the channels of their tributaries, for ½ mile upstream from the mouth of the tributaries;

(B) one mile of a public water supply intake;

(C) 500 feet of a bridge;

(D) 300 feet of a buried pipeline or cable crossing; and

(E) 200 feet of a levee or other feature subject to damage.

(3) Stockpiles of material shall be located in a manner that does not affect the flow of water on the property of any other landowner.

(d) If any sand or gravel removal operation covered by this regulation does not meet the requirements of this regulation, or if the chief engineer determines that the operation may have an unreasonable effect on the public interest, public safety, or environmental interests, the right to perform the following shall be reserved by the chief engineer:

(1) Require a nongeneral permit pursuant to K.S.A. 82a-301 et seq., and amendments thereto; and

(2) amend, modify, or revoke the general permit issued in accordance with this regulation. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective Sept. 22, 2000.)

5-46-4. General permits; pipeline crossings. (a) Before the construction of any pipeline or buried cable crossing of a stream having 50 or more square miles of drainage area above the proposed project site, the project shall meet the requirements of subsection (c) of this regulation. Before construction, the owner shall apply for and obtain a general permit from the chief engineer. The application shall be filed on a form prescribed by the chief engineer.

(b) Any pipeline or buried cable crossings of streams that have fewer than 50 square miles of drainage area above the proposed project site and that meet the requirements of subsection (c) of this regulation shall not be required to have a permit pursuant to K.S.A. 82a-301 et seq., and amendments thereto.

(c) All pipeline or buried cable crossings covered by this regulation shall meet the following requirements:

(1) Underground pipelines and cables shall be buried at a depth below the stream bed sufficient to prevent exposure. For navigable streams, underground pipelines and cables shall be buried at a minimum depth of seven feet beneath the stream bed. For all other streams, underground pipelines and cables shall be buried at a minimum depth of five feet beneath the stream bed. Pipelines and cables shall be buried sufficiently into the banks to allow for a moderate amount of stream meander without exposure. The minimum depth may be waived if the owner or applicant demonstrates that the underground pipeline or cable is adequately protected against erosion.

(2) After installation, the channel and banks shall be restored to the natural elevations and configurations as nearly as possible. Armoring devices shall be installed when necessary to ensure bank stability. Surplus excavated material shall be disposed of in a manner that will not obstruct the channel or act as a levee.

(d) If any pipeline or buried cable crossing covered by this regulation does not meet the requirements of this regulation, or if the chief engineer determines that a pipeline or cable crossing may have an unreasonable effect on the public interest, public safety, or environmental interests, the right to perform the following shall be reserved by the chief engineer:

(1) Require a nongeneral permit pursuant to K.S.A. 82a-301 et seq., and amendments thereto; and

(2) amend, modify, or revoke the general permit issued in accordance with this regulation. (Authorized by K.S.A. 82a-303a; implementing K.S.A. 82a-303; effective Sept. 22, 2000.)

Articles 47 to 49. RESERVED

Article 50.—WATER TRANSFERS

5-50-1. Definitions. As used in these rules and regulations, unless the context clearly requires otherwise: (a) "Application" means the document, made on the prescribed form furnished by the chief engineer, to request a permit to transfer water. The application shall be filed in the office of the chief engineer as provided in K.S.A. 82a-1501 et seq., as amended.

(b) "Approval of application" means issuance of a permit to transfer water as defined in K.S.A. 82a-1501(a)(1), as amended. (Authorized by K.S.A. 82a-1506; implementing K.S.A. 1995 Supp. 82a-1501; effective May 1, 1984; amended Dec. 27, 1996.)

5-50-2. Requirements for application. To be complete, a water transfer application shall show the following: (a) the name and mailing address of the applicant;

(b) the maximum quantity of water proposed to be transferred in a calendar year and the proposed maximum diversion rate;

(c) the location of the proposed point or points of diversion;

(d) the location of the proposed point or points of use;

(e) the proposed use made of the water;

(f) any economically and technologically feasible alternative source or sources of supply available to the applicant and to any other present or future users of the water proposed to be transferred. The water transfer application shall specify why this source of supply was selected over the alternative sources available;

(g) the proposed plan of design, construction and operation of any works or facilities used in conjunction with carrying the water from the point or points of diversion to the proposed point or points of use. The proposed plan shall be in sufficient detail to enable all parties to understand the impacts of the proposed water transfer;

(h) the estimated date for completion of the infrastructure and initial operation thereof;

(i) that the benefits to the state if the transfer is approved outweigh the benefits to the state if the transfer is not approved;

(j) that the proposed transfer will not impair water reservation rights, vested rights, appropriation rights or prior applications for permits to appropriate water;

(k) any current beneficial use of the water that is proposed to be transferred, including minimum desirable streamflow requirements;

(l) any reasonably foreseeable future beneficial use of the water;

(m) the economic, environmental, public health and welfare, and other impacts of approving or denying the transfer of water;

(n) any and all measures the applicant has taken to preserve the quality and remediate any contamination of water currently available for use by the applicant;

(o) the provisions of a revised management program adopted by a groundwater management district that are applicable to the proposed transfer whenever any of the proposed points of diversion are located within a groundwater management district;

(p) whether or not the applicant, and any entity to be supplied water by the applicant, have adopted and implemented conservation plans and practices that fulfill the following requirements:

(1) are consistent with guidelines developed and maintained by the Kansas water office, pursuant to K.S.A. 74-2608 and its amendments;

(2) have been in effect for not less than 12 consecutive months immediately before the filing of this water transfer application; and

(3) provide for a rate structure that encourages efficient use of water and results in conservation

and wise, responsible use of water, if the transfer is for use by a public water supply system;

(q) the effectiveness of conservation plans and practices that have been adopted and implemented by the applicant and any other entities to be supplied water by the applicant;

(r) if applicable, population projections for any public water supply system that will be supplied by the water transfer, and the basis for those projections;

(s) the projected water needs of the applicant and of any other entities to be supplied water by the applicant, and the basis for those projections;

(t) plans for any environmental mitigation made necessary by the proposed water transfer;

(u) a list of other federal, state and local permits necessary to complete the proposed water transfer and the projected dates they will be obtained;

(v) the current per capita per day usage of any public water supply user to be supplied water by the applicant, and the current average per capita per day usage of other similar users in a region of the state that is climatically similar. If the applicant's per capita per day usage exceeds the regional average, the applicant shall show why its per capita per day usage is reasonable.

(w) the projected per capita per day usage of any public water supply user to be supplied water by the applicant;

(x) a copy of the following contingently approved documents;

(1) a permit to appropriate water;

(2) an application for change in any or all of the following:

(A) the place of use;

(B) the type of use;

(C) point of diversion; or

(3) a contract to purchase water pursuant to the state water plan storage act;

(y) pursuant to K.A.R. 28-16-28b and K.A.R. 28-16-28d, the impacts of the proposed transfer on the water quality and designated uses of any stream that may be affected by the proposed transfer; and

(z) any additional factors that may be required by the chief engineer. (Authorized by K.S.A. 82a-1506; implementing K.S.A. 1995 Supp. 82a-1503; effective May 1, 1984; amended Dec. 27, 1996.)

5-50-3. (Authorized by K.S.A. 82a-1506; implementing K.S.A. 1995 Supp. 82a-1503; effective May 1, 1984; revoked Dec. 27, 1996.)

5-50-4. Emergency use. When a temporary emergency transfer of water has been approved, the chief engineer shall: (a) Require the applicant to compile and submit records, as necessary, regarding the daily rate and quantity of water transferred and any other information pertinent to the continued need for emergency transfer; and

(b) require the person requesting the transfer to consider alternate sources of water so the continued transfer will not be necessary. (Authorized by K.S.A. 82a-1506; implementing K.S.A. 1995 Supp. 82a-1502; effective May 1, 1984; amended Dec. 27, 1996.)

5-50-5. Emergency transfer of water. If the emergency causing the necessity for the transfer of water continues beyond one year, the person requesting the transfer may only file another new application for transfer for emergency use. This new application shall state the need for the water and the reasons why the need for transfer of water still exists and cannot be supplied by an alternate source. (Authorized by K.S.A. 82a-1506; implementing K.S.A. 1995 Supp. 82a-1502; effective May 1, 1984; amended Dec. 27, 1996.)

5-50-6. Authority of the chief engineer. All emergency transfers of water shall be reviewed by the chief engineer to determine whether the applicant complied with the terms, conditions, and limitations of the emergency transfer approval. (Authorized by K.S.A. 82a-1506; implementing K.S.A. 1995 Supp. 82a-1503; effective May 1, 1984; amended Dec. 27, 1996.)

5-50-7. Filing an application. Unless this requirement is waived by the chief engineer for good cause, a water transfer application shall not be considered complete until one of the following has been approved contingent upon receiving a permit to transfer water: (a) a new application to appropriate water pursuant to the Kansas water appropriation act (KWAA), K.S.A. 82a-701 *et seq.*;

(b) an application for a change in any or all of the following:

(1) point of diversion;

(2) place of use; or

(3) use made of water filed pursuant to the KWAA; or

(c) a contract for the purchase of water pursuant to the state water plan storage act, K.S.A. 82a-1301, *et seq.* (Authorized by K.S.A. 82a-1506;

implementing K.S.A. 1995 Supp. 82a-1503; effective Dec. 27, 1996.)

5-50-8. Selection of hearing officer. (a) The panel shall mail notices to, and request nominations for a hearing officer from:

(1) the applicant;

(2) entities in the area or basin where the potential point or points of diversion are located; and

(3) the commenting agencies.

(b) The panel shall also publish one notice in the Kansas register requesting nominations for a hearing officer. The panel shall allow 30 days following the notice for the nominations to be submitted.

(c) After the 30-day notice period has expired, the panel shall meet to consider the nominations and select an independent hearing officer. (Authorized by K.S.A. 82a-1506; implementing K.S.A. 1995 Supp. 82a-1501a; effective Dec. 27, 1996.)

E.16. Kentucky

DEPARTMENT FOR NATURAL RESOURCES AND ENVIRONMENTAL PROTECTION
Department for Environmental Protection
Division of Water
(401 KAR 4:030)

RELATES TO: KRS 151.250
PURSUANT TO: KRS 151.125, 224.033(17), 224.045-(6)(b), 13.082
SUPERSEDES: DOW-Rg-2
NECESSITY AND FUNCTION: This regulation is necessary to establish minimum design criteria for dams and associated structures constructed in Kentucky.

Section 1. This regulation applies to all dams as defined by KRS 151.100 and to all other impounding obstructions which might create a hazard to life or property.

Section 2. Except as modified in this regulation, the procedures outlined by the latest edition of "Design of Small Dams" (Second Edition, 1973), available from the U.S. Government Printing Office and the Bureau of Reclamation, herein filed by reference, shall be the minimum criteria.

Section 3. The Division of Water Engineering Memorandum No. 5 outlined as follows: Section A. Definitions; Section B. Structure Classification; Section C. Hydrologic Criteria; Section D. Sediment Storage; Section E. Principal Spillways; Section F. Emergency Spillways; Section G. Earth Embankments; and Section E. Utilities Under Embankments; is hereby incorporated by reference and made a part of this regulation as if fully set out herein. Copies are available from the Division of Water upon request.

Section 4. Structure types not generally used in Kentucky, i.e., gravity, buttress, steel, timber, etc., will be considered on an individual basis and reviewed in accord with prevailing practices that are currently accepted by the engineering profession.

Section 5. In all cases the safety of the structure, the water and/or other material impounded therein, property and human life will be the principal governing factors. Under no circumstances will the proposed use of the structure and its contents, or the cost of providing an unquestionably safe structure be allowed to assume precedence over the possible hazard involved.

Section 6. Structures which are to be repaired or reconstructed must be made to conform to the criteria established by this regulation.

Section 7. Each of the following stated criteria indicates whether the limit is a maximum or minimum limit and is not to be construed as being satisfactory design criteria at all sites. Professional judgment, state laws and regulations, investigations, or analysis may dictate more conservative criteria.

Section 8. (1) Approval of all plans and specifications shall be divided into two (2) distinct parts:

(a) Issuance of a construction permit pursuant to KRS 151.250 shall constitute approval of the final engineering documents to allow construction to be started; and

(b) Final written approval by the department upon receipt of the "as-built" plans and specifications will constitute approval to impound.

(2) No approval to impound water and/or other material is implied or is in any way granted until the "as-built" plans and specifications have been approved, an on-site inspection has been made, and a written statement of approval issued. It is recommended that the owner and/or his engineer contact this division before initiation of final design for a pre-design conference.

Section 9. All plans and specifications submitted for consideration must bear the seal and signature of the responsible engineer as defined in KRS 322.010 (2), except officers and employees of the United States Government while engaged in engineering for the government. Each sheet of the drawings shall bear the seal and signature of the engineer or engineers responsible for its preparation.

Section 10. All structures, other-than Class A as defined in Engineering Memorandum No. 5 (2-1-75) shall have a complete sub-surface investigation and soil analysis submitted as an integral part of the drawings.

Section 11. (1) Elevation area capacity data and elevation discharge data must be submitted as a part of the plans for each structure. This elevation area capacity data shall give the area and capacities from the elevation of the lowest point in the impoundment area to at least the elevation at the top of the dam. When the configuration of the structure will not allow the elevation discharge relationship to be developed by methods accepted as standard by the engineering profession, the structure must provide the storage necessary to contain the entire storm runoff without probable damage to the structure or creating an unacceptable hazard to life or property.

(2) When this required basic information is furnished by the responsible design engineer, the Division of Water will upon request assist the engineering in preparing the floodroutings required by Engineering Memorandum No. 5.

(3) In the event that the elevation area capacity data is not furnished or the floodroutings show that insufficient floodwater storage has been provided, the plans will be returned to the design engineer without being approved.

Section 12. All information concerning elevations shall refer to mean sea level and the use of assumed elevations for any purpose is prohibited. Should an error in either the horizontal control or vertical control become known during construction, the necessary information to correct the distances and the elevations shall be referred to on the first sheet of the "as-built" drawings or referred to in the index. Clearly marked reference points and bench marks shall be maintained at the job site by the responsible engineer until final written approval is received.

Section 13. Unless waived in writing by the department, no structure shall be approved unless a positive means is provided to pass water through the structure in sufficient quantity to satisfy the needs of downstream users and to empty the reservoir within a reasonable length of time. Conditions considered in determining downstream water requirements and required minimum time to empty the impoundment shall be determined by the responsible engineer and referred to on the drawings.

Section 14. Construction supervision and inspection must be performed by or under the direction of the design engineer. Unless otherwise directed by the department the engineer shall submit monthly progress reports on forms to be supplied by the department. Copies of all testing reports shall be submitted with the progress reports.

Section 15. All "as-built" documents shall be submitted by the responsible engineer in the form of permanent type drawings of a standard and uniform size. Variations in size will be permitted for federal agencies in order that they may use their standard drawings. Drawings that do not conform to standard practices or drawings that are not easily legible will not be accepted.

Section 16. Because of the department's statutory duty to review federal projects for the Commonwealth under KRS 151.220, the United States Army Corps of Engineers is exempt from the provisions of this regulation and KRS 151.250.

ADOPTED: March 12, 1975
RECEIVED BY LRC: March 13, 1975 at 2:31 p.m.

DOW/CP-021
Revised 10/80

DEPARTMENT FOR NATURAL RESOURCES AND ENVIRONMENTAL PROTECTION
Department for Environmental Protection

Division of Water
(401 KAR 4:040)

RELATES TO: KRS 151.250
PURSUANT TO: KRS l5l.l25, 224.033(17), 224.045(6)(b), 13.082
SUPERSEDES: DOW-Rg-3
NECESSITY AND FUNCTION: This regulation is necessary to exempt certain dams, embankments, levees, dikes, bridges, fills, and other stream obstructions proposed in conjunction with surface and deep mining from the provisions of KRS Chapter 151 to avoid duplication of effort within the Department for Natural Resources and Environmental Protection.

Section 1. As a part of the routine processing of application for permits for surface mining and the surface effects of deep mining, the engineering staff of the Division of Permits, Bureau of Surface Mining Reclamation and Enforcement, reviews all designs for dams, embankments, levees, dikes, bridges, fills, and other stream obstructions proposed in conjunction with surface or deep mining and, whereas a substantial number of such dams, embankments, levees, dikes, bridges, fills, and other stream obstructions are of such a size, type, and location as to present no potential hazard to life and/or property; this regulation exempts from the provision of KRS 151.250 all such dams, etc., as described above, except those dams which come within the hazard classification contained in Division of Water Engineering Memorandum No. 5 (2-1-75), and those obstructions as described, which, in the professional judgment of the Division of Permits engineering staff, present a potential hazard to life and/or property. Copies of Engineering Memorandum No. 5 (2-1-75) are available upon request from the Division of Water.

Section 2. Certified, "as-built" engineering plans for all dams which impound or divert water and/or other material and which (i) are twenty-five (25) feet or more in height or (ii) have an impounding capacity of fifty (50) acre-feet or more at the lowest point on the top of the dam must be forwarded by the Division of Permits to the Division of Water for inclusion in the Dam Safety Program required by KRS 151.295(c). Height is measured from the natural bed of the stream or watercourse at the downstream toe of the barrier to the low point in the top of the dam.

SECTION A - DEFINITIONS	6
SECTION B - STRUCTURE CLASSIFICATION	8
SECTION C - HYDROLOGIC CRITERIA	11
SECTION D - SEDIMENT STORAGE	15
SECTION E - PRINCIPAL SPILLWAYS	16
SECTION F - EMERGENCY SPILLWAYS	25
SECTION G - EARTH EMBANKMENTS	34
SECTION H - UTILITIES UNDER EMBANKMENTS	35

SECTION A - DEFINITIONS

A spillway is an open or closed channel, or both, used convey water from a reservoir. It may contain gates, either manually or automatically controlled, to regulate discharge of water.

The principal spillway is the ungated spillway designed convey the water from the retarding pool at release rates established for the structure.

The emergency spillway of a dam is the spillway designed convey water in excess of that impounded for flood control or other beneficial purposes.

The retarding pool is the reservoir space allotted to the temporary impoundment of floodwater. Its upper limit is the elevation of the crest of the emergency spillway.

Retarding storage is the volume in the retarding pool.

The sediment pool is the reservoir space allotted to the accumulation of submerged sediment during the life of the structure.

The sediment storage is the volume allocated to total sediment accumulation.

The sediment pool elevation is the elevation of the surface the anticipated sediment accumulation at the dam.

An earth spillway is an unvegetated open channel spillway in earth materials.

A vegetated spillway is a vegetated open channel spillway in earth materials.

A ramp spillway is a vegetated spillway constructed on the downstream face of an earth dam.

A rock spillway is an open channel spillway in durable rock materials.

A control-section in an open channel spillway is that section where accelerated flow passes through critical depth.

The inlet channel of an emergency spillway is the channel upstream from the control section.

The exit channel of an emergency spillway is that portion of the channel downstream from the control section which conducts the flow safely to a point where it may be released without jeopardizing the integrity of the structure.

The emergency spillway-hydrograph is that hydrograph used to establish the minimum design dimensions of the emergency spillway.

The freeboard hydrograph is the hydrograph used to establish the minimum elevation of the top of the dam.

Joint extensibility is the length of a pipe joint measured from the center of the gasket to the point of flare of the bell ring or collar when the joint is engaged.

Joint gap is the longitudinal dimension between the end face of the spigot end of a pipe joint and the corresponding face of the bell end of the connecting pipe. It does not include the beveled portions designed for sealing compounds.

The rotation capacity of a pipe joint is the maximum angular deflection possible for the joint without binding or loss of watertightness.

The maximum possible high water is the maximum elevation of the water surface that might be attained either above or below the structure, which may be attributed to structure.

The height of the embankment is the distance in feet measured from the natural bed of the stream or watercourse at the downstream toe of the barrier to the low point in the top of the dam.

SECTION B - STRUCTURE CLASSIFICATIONS

		PAGE
I.	CLASS OF STRUCTURES	9
	A. Class (A) - Low Hazard	9
	B. Class (B) - Moderate Hazard	9
	C. Class (C) - High Hazard	9
II.	STRUCTURES IN SERIES	10

SECTION B - STRUCTURE CLASSIFICATION

In determining structure classification, a number of factors must be considered. Consideration must be given to the damage that might occur to existing and future developments downstream resulting from a sudden breach of the earth embankment and the structures themselves. The effect of failure on public confidence is an important factor. State and local regulations and the responsibility of the involved public agencies must be recognized. The stability of the spillway materials, the physical characteristics of the site and valley downstream, and the relationship of the site to industrial and residential areas all have a bearing on the amount of potential damage in the event of a failure.

Structure classification is determined by the above conditions. It is <u>not</u> determined by the criteria selected for design.

1. CLASS OF STRUCTURES

The following broad classes of structures are established to permit the association of criteria with the damage that might result from a sudden major breach of the structure.

A. <u>Class (A) - Low Hazard</u>

This classification may be applied for structures located such that failure would cause loss of the structure itself but little or no additional damage to other property. Such structures will generally be located in rural or agricultural areas where failure may damage farm buildings other than residences, agricultural lands, or county roads.

B. <u>Class (B) - Moderate Hazard</u>

This classification may be applied for structures located such that failure may cause significant damage to property and project operation, but loss of human life is not envisioned. Such structures will generally be located in predominantly rural agricultural areas where failures may damage isolated homes, main highways or major railroads, or cause interruption of use or service of relatively important public utilities.

C. <u>Class (C) - High Hazard</u>

This classification must be applied for structures located such that failure may cause loss of life, or serious damage to houses, industrial or commercial buildings, important public utilities, main

highways or major railroads. This classification must be used if failure would cause probable loss of human life.

The responsible engineer shall determine the classification of the proposed structure after considering the characteristics of the valley below the site and probable future development. Establishment of minimum criteria does not preclude provisions for greater safety when deemed necessary in the judgment of the engineer. Considerations other than those mentioned in the above classifications may make it desirable to exceed the established minimum criteria. A statement of the classification established by the responsible engineer shall be clearly shown on the first sheet of the plans.

II. STRUCTURES IN SERIES

When structures are spaced so that the failure of an upper structure could endanger the safety of a lower structure, the possibility of a multiple failure must be considered assigning the structure classification of the upstream structure.

Additional safety can be provided in either structure by (1) increasing the retarding storage and/or (2) increasing the emergency spillway capacity.

SECTION C - HYDROLOGIC CRITERIA

		PAGE
I.	RUNOFF	12
	A. Structure in Series	12
II.	PRINCIPAL SPILLWAY	13
III.	EMERGENCY SPILLWAY	13
IV.	FREEBOARD	13
V.	MINIMUM HYDROLOGIC CRITERIA	14

SECTION C - HYDROLOGIC CRITERIA

I. RUNOFF

Procedures for hydrologic design as contained in the USDA Soil Conservation Service National Engineering Handbook, Section 4 "Hydrology" will be accepted. Copies of this publication are available from the U. S. Government printing office.

The specific references for runoff determination are found in Chapter 10. All runoff volumes for design purposes will be based on Antecedent Moisture Condition II or greater. Chapter 21 contains hydrologic procedures for determining principal spillway capacities, retarding storage, and emergency spillway and freeboard hydrographs.

A. Structures in Series

For the design of a lower structure in a series, if the total drainage area above a lower structure exceeds 10 square miles and Section B-II of this memorandum applies, it is necessary to apply two sets of storms for development of both the emergency spillway and the freeboard hydrographs.

The first set of design storms will be selected for the development of the uncontrolled drainage area above a lower structure. The dimensions of the emergency spillway for a lower structure under this condition will be determined by reservoir routings of hydrographs developed for each storm.

The second set of design storms will be selected for the entire drainage area above the lower structure. Each design storm rainfall is determined by using this area in the areal adjustment of rainfall amounts. These design storm durations are determined by using the time of concentration of this area assuming no upper structures are in place. The design storm hydrographs will be routed through the emergency spillways of the upstream structures and the outflow routed to the lower structure and combined with the hydrograph for the uncontrolled area. The dimensions of the emergency spillway for a lower structure under this condition will also be determined by reservoir routings of the hydrographs developed for each storm.

The design storm imposing the most severe flow condition at the lower structure will be used.

II. PRINCIPAL SPILLWAY

The retarding storage and associated principal spillway discharge will be such that the emergency spillway will not operate more frequently than indicated in Table F-I, Section B, Emergency Spillways. The inflow hydrograph or the minimum runoff volume for developing the balance between principal spillway capacity and retarding storage will be determined by procedures in Chapter 21, Section 4, SCS National Engineering Handbook. In areas where streamflow records can be regionalized and transposed to ungaged watersheds (based on the volume-duration-probability analyses), the Division of Water will authorize the use of these data for developing the principal spillway capacity and retarding storage. When other streamflow data are used, sufficient documentation must be prepared to show how these values were determined.

In the determination of the retarding storage and the principal spillway capacity, it is assumed that the initial reservoir stage is at the crest of the principal spillway.

III. EMERGENCY SPILLWAY

The emergency spillway hydrograph will be routed through the reservoir starting with a water surface at the elevation of the principal spillway inlet or at the water surface elevation after 10 days of drawdown, whichever is higher. The 10-day drawdown will be computed from the maximum water surface elevation which would be attained during the passage of the minimum principal spillway design runoff for that class of structure.

IV. FREEBOARD

The freeboard hydrograph for class (A) and (B) structures will be routed through the reservoir starting at the same water surface elevation as for the emergency spillway hydrograph. The routing of the freeboard hydrograph for class (C) structures may be started at the crest of the principal spillway.

V. MINIMUM HYDROLOGIC CRITERIA

Minimum hydrologic criteria are established for the development of each hydrograph as follows:

Emergency Spillway Hydrograph

Class (A) $P_A = P_{100}$
Class (B) $P_B = P_{100} + 0.12 \times (PMP - P_{100})$
Class (C) $P_C = P_{100} + 0.26 \times (PMP - P_{100})$

Freeboard Hydrograph

Class (A) $P_A = P_{100} + 0.12 \times (PMP - P_{100})$
Class (B) $P_B = P_{100} + 0.40 \times (PMP - P_{100})$
Class (C) $P_C = PMP$

in which P denotes 6-hour design rainfall, P_{100} refers to 6-hour, 100-year precipitation, and PMP represents 6-hour Probable Maximum Precipitation.

The above values may be obtained from the "Rainfall Frequency Atlas of the United States for Durations from 30 Minutes to 24 Hours and Return Periods from 1 to 100 Years", Technical Paper No. 40, Weather Bureau, U. S. Department of Commerce, Washington, D. C., and "Two To Ten-Day Precipitation For Return Periods of 2 To 100 Years In Contiguous United States", Technical Paper No. 49, Weather Bureau, U. S. Department of Commerce, Washington, D. C. These values may also be found in Division of Water, Kentucky Department for Natural Resources and Environmental Protection, Engineering Memorandum No. 2, “Rainfall Frequency Values for Kentucky.”

When hydrographs are required for drainage areas with times of concentration in excess of 6 hours, the above must be modified to reflect the appropriate storm period.

The establishment of the above criteria does not eliminate the need for sound engineering judgment but only establishes the lowest limit of design considered acceptable.

It is the responsibility of the design engineer to classify the structure and to determine if the design requirements are in excess of the minimum.

SECTION D - SEDIMENT STORAGE

Where the primary purpose is floodwater retardation or water storage or combination thereof, reservoirs are normally designed on the basis of a 50 to 100-year useful life. In order to assure full effectiveness, capacity must be provided in the reservoir to offset depletion due to sediment accumulation for a period equal to its design life.

H.	Drawdown Facilities	24

SECTION E - PRINCIPAL SPILLWAYS

All component parts of the principal spillway except attached gates and trash racks will be of equal durability. The structural design criteria and detailing of such spillways will conform to recognized standards and codes of practice.

I. CAPACITY OF PRINCIPAL SPILLWAYS

The required capacity of the principal spillway depends on (1) the benefits that accrue to the reduction of the discharge rate, (2) damages that may result from prolonged storage in the retarding pool, (3) damages that may result from prolonged outflow, (4) the possibility of occurrence of significant runoff from two or more consecutive storm events within the time required to empty the retarding pool, and (5) limitations in water rights or other legal requirements.

It is desirable that the retarding pool be emptied in ten (10) days or less. It may be assumed that this requirement has been met if eighty (80) percent of the maximum volume of retarding storage has been evacuated in the ten (10) day period. The use of a longer period must be justified by an appraisal of the considerations listed above.

The discharge through gated outlets will not be considered in determining the emptying time of the retarding pool *unless* a specific reservoir operation plan has been approved and included in the plans.

II. ELEVATION OF PRINCIPAL SPILLWAYS

The crest of a single stage principal spillway will be placed at the elevation of the 50-year sediment pool except where a higher elevation is justified. For a two stage principal spillway, the crest of the lower inlet will be set at the same elevation as for a single stage structure. When a period greater than 50 years has been used for evaluation, it is recognized that structural changes may be necessary to make the structure function effectively during the latter part of its life.

For dry dams, the riser will be designed to permit design discharge at the 50-year sediment pool elevation with provisions for discharging water at lower elevations to satisfy the functional requirements of the structure. Flood routings must start at or above the anticipated elevation of the 50-year sediment pool.

When water is stored for beneficial use, the elevation of the lowest ungated inlet of the principal spillway will be determined by the volume, area, or depth of water required for the planned purpose or purposes in addition to the anticipated sediment storage during the design life.

III. DESIGN OF PRINCIPAL SPILLWAYS

A. Layout

The barrel of drop inlets should be straight in alignment when viewed in plan. Any required changes in alignment will be accomplished by angle changes at joints which do not exceed five degrees or by special elbows having a radius equal to or greater than the diameter or width of the conduit. Thrust blocks of adequate strength will be provided where special pipe elbows are used. They will be designed to distribute the thrust, due to change in direction, for the maximum possible discharge.

Drop inlet barrels will be installed with sufficient camber to insure free drainage to the outlet of all parts of the barrel at the time of construction and under the maximum anticipated foundation consolidation.

B. Conduits

All conduits under an earth embankment must support the external loads imposed with an adequate factor of safety. They must withstand the internal hydraulic pressures without leakage under full external load and settlement. They must convey water at the design velocity without damage to the interior surface of the conduit.

Principal spillway conduits under earth dams must be designed to support fill heights greater than the original constructed height where there is a reasonable possibility that it may become desirable to raise the embankment height at a later date to incorporate additional storage.

Principal spillway conduits are to be of reinforced concrete pipe, cast-in-place reinforced concrete, or ductile iron pipe, unless corrugated steel or welded steel pipe is used in accordance with subsection III-B-2, which follows:

1. Rigid Pipe

Rigid drop inlet barrels will be designed as positive projecting conduits. For reinforced Concrete Water Pipe Steel Cylinder Type, Prestressed, meeting specification AWWA C-301, the 3-edge bearing strength at the first 0.001 inch crack will be used in the design analysis with a factor of safety of at least one.

For reinforced Concrete Water Pipe - Steel Cylinder Type - Not Prestressed meeting specification AWWA C-300, for Reinforced Concrete Water Pipe - Non-cylinder Type - Not Prestressed meeting specification AWWA C-302, and other types of reinforced concrete pipe, the

3-edge bearing strength at the first 0.01 inch crack will be used in the design analysis with a factor of safety of at least 1.33.

Ductile Iron Pipe may be used as a principal spillway conduit under certain conditions. Fill heights and foundation conditions require special considerations such that each use will be checked on an individual basis. Cradling or encasement in concrete may be required in most instances.

Elliptical or other systems of reinforcement requiring special orientation of pipe sections are not permitted in pipe drop inlet barrels.

Reinforced concrete pipe, with or without cradles, will be designed to support at least 12 feet of earth fill above the pipe at all points along the conduit.

These safety factors are for uniform conditions. They should be increased if the strength and compressibility of the foundation are not reasonably uniform.

a. Minimum Inside Diameters on Yielding Foundations.

Class (A) dams: The minimum diameter of the principal spillway barrel will be 30 inches except:

(1) Where a joint extension safety margin of 1.5 inches is used, in which case the minimum diameter is to be 18 inches for fill heights up to 50 feet and 24 inches for greater heights.

(2) Where the drop inlet is designed hydraulically in such a way that the flow in the barrel under all possible conditions of discharge and foundation consolidation is positively known to be open channel flow with the water surface in the conduit subject to atmospheric pressure only, in which case the minimum diameter will be 18 inches.

(3) Where corrugated metal pipe is used the principal spillway must be designed in accordance with conditions presented in Section III-B-2 below.

Class (B) dams: The minimum diameter of the principal spillway barrel will be 30 inches, except where a joint extension safety margin of 1.5 inches is used, in which case the minimum diameter will be 24 inches.

Class (C) dams: The minimum diameter of the principal spillway barrel will be 30 inches.

b. Minimum Inside Diameter on Rock Foundations

Class (A) , (B) , and (C) dams: The minimum diameter of the barrel of reinforced-concrete pressure pipe drop inlets for class (1) dams is to be 18 inches for heights up to 50 feet and 24 inches for heights greater than 50 feet, and 24 inches for all class (B) and (C) dams. The barrel and cradle or bedding are to rest directly on firm bedrock thick enough so that there is essentially no foundation consolidation under the barrel. Under these conditions the cradle under the pipe need not be articulated.

2. Corrugated Metal Pipe and Welded Steel Pipe

Principal spillways of corrugated metal pipe or welded steel pipe may be used for class (A) dams under the following conditions, all of which must be met:

a. The minimum diameter of the barrel will be 18 inches.

b. The height of fill over the pipe will be less than 25 feet.

c. Corrugated steel pipe is to be close riveted, asbestos treated, and asphalt coated, with watertight connecting bands. The minimum gage is to be that specified for 35 feet of fill over the pipe.

d. Welded steel pipe conduits are to conform to ASTM specifications A53, A120, A135, A139, or A134 and are be structurally designed as rigid pipe. A joint extension safety margin of 1.5 inches is to be provided for conduits on yielding foundations. Welded pipe is to be protected by an approved exterior coating.

e. Joints between lengths of corrugated steel or welded steel pipe, other than welded joints, are to electrically bridged on the outside of the pipe with insulated copper wire, #6 AWG or larger, securely attach to uncoated pipe metal at both sides of the joint. The requirement applies whether or not the cathodic protection is completed by the installation of anodes, etc. The wire should have a tough, waterproof insulation designed for direct burial, with a rating of at least 600 volts. Bare wire and exposed pipe metal at the points of connection are to be thoroughly coated with a coating equivalent the original pipe coating to prevent the entry of moisture.

f. Soil investigations for resistivity and pH of the subgrade and backfill materials to be adjacent to the conduit are to be made if corrugated steel or welded steel pipe is to be used. The resistivity measurements are to be made on saturated samples.

g. Cathodic protection is to be provided for welded steel pipe conduits according to approved engineering criteria.

h. Cathodic protection meeting the above requirements is to be provided for corrugated steel pipe in soil whose resistivity in a saturated condition is less than 4000 ohms/cm³ or whose pH is lower than 5.0.

i. If cathodic protection for corrugated steel or welded steel pipe is not required according to the above criteria and is not installed during construction of the dam, pipe-to-soil potentials are to be measured within the first two (2) years after construction when the soil around the conduit is estimated to be at its normal post-construction moisture content, and cathodic protection is to be installed if such measurements indicate it is needed.

C. JOINTS

Conduit joints will be designed and constructed to remain water tight under maximum anticipated hydrostatic head and maximum probable conditions of joint opening including the effects of joint rotation and a margin of safety where required.

The required joint extensibility is equal to the unit horizontal strain in the earth adjacent to the barrel, multiplied by the length (in inches) of the section of barrel between joints, plus the extension (in inches) due to calculated joint rotation, plus a margin of safety if required. A margin of safety of 0.5 inch is recommended. The required joint extensibility, plus the maximum permissible joint gap equals the required joint length.

The calculation of the required joint extensibility for any particular dam and spillway depends, among other things, on the evaluation of the maximum potential foundation consolidation under the spillway barrel. For Classes (B) and (C) dams, the consolidation will be estimated from adequate foundation borings and samples, soil mechanics laboratory tests and engineering analysis.

For those Class (A) dams where undisturbed foundation samples are not taken for other purposes, approximate procedures based on soil classification and experience will be used for estimating foundation consolidation. When AWWA C-302 or other types of reinforced concrete pipe are used, they will have rubber to steel joints.

Only joints incorporating a round rubber gasket set in a positive groove which will prevent its displacement from either internal or external pressure under the maximum designed joint extensibility will be used on precast concrete pipe drop inlet barrels.

Articulation of the barrel will be provided at each joint in the barrel and at the junction of the barrel and the inlet (riser). Concrete bedding for pipe drop inlets need not be articulated: cradles will be articulated when on yielding foundations.

D. Anti-Seep Collars

All conduits through earth embankments, foundations, and abutments will be provided with anti-seep collars.

The minimum number of anti-seep collars will be determined by the size of collars and the length of that portion of the conduit which lies in the saturated zone of earth embankment.

The following criteria will be used to determine the size and number of anti-seep collars.

Let V = the vertical projection and minimum horizontal projection of the anti-seep collar in feet.

L = Length in feet of that portion of the barrel of a drop inlet or culvert lying within the zone of saturation, measured from the downstream side of the riser to the toe drain, or point where phreatic line intercepts the conduit.

n = Number of anti-seep collars.

The length of the line of seepage is defined as the distance along the line of contact between the earth embankment and the barrel and the anti-seep collars from the upstream end of the barrel to the point of intersection of the barrel and the phreatic line. The ratio of the length of the line of seepage (L + 2 n V) to L will not be less than 1.15.

Anti-seep collars should be equally spaced, except where necessary to avoid pipe joints, along that portion of the barrel within the saturated zone at distances of not more than 25 feet.

In the absence of positive evidence to the contrary (for purposes of computing anti-seep collar requirements) the location of the phreatic line in the earth dam embankment will be estimated on the assumption that the foundation of the embankment is impervious or that it is fully saturated.

E. Cantilever - Outlets

The invert of cantilever outlets of pipe drop inlets or culverts at its lower end will be at least one foot above the tailwater elevation of the downstream channel at maximum discharge.

Cantilever outlets will be supported on bents or piers and will extend a minimum of eight feet beyond the bents or piers. The bents will be located downstream from the intersection of the downstream slope of the earth dam embankment with the grade line of the channel below the dam. They will extend below the lowest elevation anticipated in the scour hole.

In determining the depth of the stilling basin, full consideration must be given to the total energy to be dissipated. The stilling basin will be excavated when soil conditions at the downstream end of the cantilever outlet indicate that a stilling basin will not be readily formed without extensive erosion of channel banks or the embankment.

Adequate safeguards must be taken to insure that the seepage forces into the stilling basin will not result in a piping failure.

F. Trash Racks

Trash racks will be designed and built to provide positive protection against clogging of the spillway at any point. The average velocity of flow through a clean trash rack will not exceed two feet per second with the water elevation in the reservoir five feet above the top of the trash rack or at the crest of the emergency spillway whichever is lower. Velocity will be computed on the basis of the net area of opening through the rack.

For dry dams, a trash rack may be used in lieu of a ported concrete riser. The principal spillway trash rack will extend sufficiently above the anticipated sediment elevation at the inlet to provide full design flow through the spillway with velocities through the net area of the trash rack above the sediment elevation not in excess of two feet per second when the water surface in the reservoir is five feet above the top of the trash rack.

G. Anti-Vortex Device

All closed conduit principal spillways designed for pressure flow will have an adequate anti-vortex device.

H. Drawdown Facilities

The necessary drawdown facility for any dam may be made an integral part of the principal spillway structure if the principal spillway configuration warrants, but in no case will the drawdown facility be allowed to be valved on the downstream side of the embankment. This precludes in any case a wet line under pressure through the embankment.

This above stated requirement will be waived in the case of a water supply line through the dam but provision must be made for a positive shutoff on the upstream side of the structure.

	2. Earth Emergency Spillways	32
III.	ROCK EMERGENCY SPILLWAYS	33
IV.	STRUCTURAL EMERGENCY SPILLWAYS	33
V.	WATER SURFACE PROFILE	33

SECTION F - EMERGENCY SPILLWAYS

Emergency spillways are provided to convey large flows safely past an earth embankment. They are usually open channels excavated in earth or rock or constructed of compacted embankment or reinforced concrete.

An emergency spillway must be provided for each structure, unless the principal spillway is large enough to pass the routed freeboard hydrograph discharge and the trash that comes to it. A conduit type principal spillway having a barrel with a cross-sectional area of 36 square feet or more, an inlet which will not clog, and an elbow designed to facilitate the passage of trash, is a minimum size and design that may be utilized without an emergency spillway. If a principal spillway of this type and size is not provided, danger from clogging requires the use of an emergency spillway regardless of the volume of storage provided.

A single uncontrolled open channel spillway may be used for all purposes provided it is designed to accommodate all discharges, including the freeboard storm, without damage to the structure. However, a positive means to drain the lake must also be provided unless waived in writing by the Director.

I. SPILLWAY REQUIREMENTS

A. Capacity of Emergency Spillways

Emergency spillways will be proportioned so that they will pass the emergency spillway hydrograph at the safe velocity determined for the site. They will have sufficient capacity to pass the freeboard hydrograph with the water surface in the reservoir at or below the elevation of the settled height of the dam. When the principal spillway is of the size and design that requires the use of an emergency spillway, the capacity of the emergency spillway will not be less than that determined from

$$Q = 230 \times A^{0.5}$$

where Q is the spillway capacity in cubic feet per second and A is the drainage area in square miles but in no case shall a Q of less than 200 cfs be used.

B. Elevation of the Crest of the Emergency Spillway

The minimum crest elevation of the emergency spillway depends on the frequency of operation selected for the specific site. The minimum retarding storage volume and the associated

principal spillway discharge will be such that the emergency spillway discharge will not occur during the routing of the runoff from any duration storm of the selected frequency.

C. Hydraulic Design

The relationship between the water surface elevation in the reservoir and the discharge through the emergency spillway will be evaluated by computing the head losses in the inlet channel upstream of the control section, or if a control section is not used, by computing the water surface profile through the full length of the spillway.

Manning's formula will be used to evaluate friction losses and determine velocities. Policy on the selection of the "n" values is given in the discussion of the various types of emergency spillways.

II. VEGETATED AND EARTH EMERGENCY SPILLWAYS

Vegetated and earth emergency spillways are open channels and usually consist of an inlet channel, a control section, and an exit channel (see Section A - Definitions). Subcritical flow exists in the inlet channel and the flow is normally supercritical in the exit channel.

Vegetated emergency spillways are usually trapezoidal in the cross-section and are protected from damaging erosion by a grass cover. They are adapted to sites where a vigorous grass growth can be sustained by normal maintenance without irrigation.

Earth spillways are used in those areas where vegetative growth cannot be maintained. They are similar to vegetated spillways but are designed for lower permissible velocities and less frequent use. Normally they will require more maintenance after a flow occurs.

Earth and vegetated emergency spillways are designed on the basis that some erosion or scour may be permissible if its occurrence is infrequent, if maintenance facilities are provided, and if damage from a severe storm, as represented by the freeboard inflow hydrograph, will not endanger the structure.

A Manning's "n" of 0.040 will be used for determining the velocity and capacity in vegetated spillways. Permissible velocities in earth spillways will be based on an “n” value of 0.020 but the capacity of earth spillways will be based on an appraisal of the roughness condition at the site.

A. Layout

Emergency spillways should be located away from the dam site whenever possible. Topographic saddles generally make good sites.

The layout and profile of vegetated or earth spillways should provide a maximum bulk of material to provide safety against breaching of the spillway during the passage of the freeboard hydrograph. This can be accomplished by the proper selection of the location and layout of the spillway. A long, non-deepened inlet section will provide more bulk but has the disadvantage of requiring a higher stage in the reservoir for any given discharge. The exit channel should be as long as reasonably practical with just sufficient slope to meet hydraulic design requirements. The characteristics and layering of the materials on which the spillway is built must be considered in estimating the volume required to prevent breaching.

The inlet channel will be level for a minimum distance of 30 feet upstream from the control section. This level part of the inlet channel will be the same width as the exit channel, and its centerline will be straight and coincident with the centerline of the exit channel. A curved centerline is permissible in the inlet channel upstream from the level section, but it must be tangent to the centerline of the level section.

The centerline of the exit channel will be straight and perpendicular to the control section for a distance equal to at least one-half of the maximum base width of the dam. Curvature may be introduced below this point if it is certain that the flowing water will not impinge on the dam should the channel fail at the curve.

When a control section is utilized, the grade of the exit channel should be sufficient to insure supercritical flow for all discharges equal to or greater than 25 percent of the maximum discharge through the emergency spillway during the passage of the emergency spillway hydrograph. However, the slope in the exit channel need not exceed 4 percent (s=0.04 ft/ft) to meet this requirement.

The spillway discharge may be conducted by an exit channel to a point some distance above the stable grade of the natural stream channel. When this is done, the discharge is allowed to spread naturally over the existing topography and find its way to the channel downstream. This layout involves no consideration of velocities beyond the exit channel and during spillway discharge there may be considerable erosion on those reaches not designed on a permissible velocity basis.

Another approach is to construct a channel from the end of the exit channel to stable grade below. In this case, the lower constructed channel may be designed with higher velocities than are permissible in the exit channel proper. This assumes that erosion in the lower, well defined,

improved channel may be less damaging than that occurring where the discharge is permitted to meander over the natural relief in reaching stable grade.

In both layouts erosion will occur wherever the permissible velocities are exceeded and maintenance will be required to protect the integrity of the spillway.

1. Special Precautions for Class (C) Structures

Special consideration must be given to the layout of spillways on human hazard structures to assure that the spillway will not breach under the most extreme conditions of flow. The length of the exit channel should be increased to the maximum extent possible so that the area most subject to erosion is at a considerable distance from the dam. Within the limitations of the site, the profile of the spillway will be such that a maximum bulk of material is provided.

It is preferable that the flow be confined without the use of levees, but when they are necessary they will be high enough so that they will not be overtopped during the passage of the freeboard hydrograph. Levees will be constructed of erosion resistant materials and will be compacted to the degree necessary to develop this resistance. They will have a toe width not less than 12 feet and, if not protected with riprap, have side slopes not steeper than 3 horizontal to 1 vertical. When constructed on foundations subject to piping or undermining, they will be keyed into the foundation with a compacted core having a width not less than the top width of the levee and sufficient depth to reach sound material, or at least equal to the height of the levee.

Where the bulk or quality of the material in the spillway may be questionable, it may be desirable to provide a crest control structure at the control section. The purpose of this structure is to stabilize the crest of the emergency spillway for at least the period equal to the passage of the freeboard hydrograph. It is subject to eventual failure if the exit channel is not properly maintained.

Consideration should also be given to the reduction of the duration of flow through the emergency spillway by raising the elevation of the crest of the emergency spillway, thereby increasing the volume of storage in the retarding pool. An alternate or complementary procedure is to increase the capacity of the principal spillway by means of a two stage inlet of sufficient size to have an appreciable effect on the outflow hydrograph of the reservoir.

B. Frequency of Use of Earth and Vegetated Emergency Spillways

Table F-I gives the permissible frequency of use of earth and vegetated emergency spillways. For earth spillways, it refers to sites where peak flow of short duration may be expected, and where erosion resistant soils and moderate slopes exist. When vegetated spillways are used,

the sites must have these same characteristics, and in addition, conditions must be such that vigorous vegetation can be maintained without irrigation.

TABLE F-1
ALLOWABLE FREQUENCY OF USE OF EMERGENCY SPILLWAYS

Emergency Spillway Maximum Frequency of Use			
Class of Structure	Earth Once In	Vegetated Once In	Rock Once In
(A)	50 years	25 years	10 years
(B)	100 years	50 years	25 years
(C)	100 years	100 years	50 years

When conditions are less favorable, spillways must be designed for less frequent use by (1) raising the elevation of their crest, (2) providing a second stage of greater capacity to the principal spillway, or (3) increasing the capacity of the principal spillway.

The maintenance required for the emergency spillway will be increased as the flow frequency and duration increases. Good design requires balancing the spillway maintenance cost against the increased cost of modifying the other elements of the dam to reduce the flow frequency.

C. Permissible Velocity in Vegetated Earth Emergency Spillways

The maximum velocity limitations given below for vegetated or earth emergency spillways apply to the exit channel. They must not be exceeded from the control section to a point where (1) the distance from the control section is at least equal to one-half the maximum base width of the embankment and (2) a channel failure might cause the flow to impinge on the toe of the dam. The velocity limitations are based on the capacity required by routing the emergency spillway hydrograph and the assumption that uniform flow conditions exist in the exit channel. When the spillway is of the minimum capacity as determined by $Q=230 \cdot A^{0.5}$, the velocity limitation will only apply to the lesser flow that would be developed by routing the emergency spillway hydrograph.

1. Vegetated Emergency Spillways

When the anticipated average use of a vegetated emergency spillway is more frequent than once in 50 years, the maximum permissible velocity will be in accordance with the values given in Table F-II. The values may be increased 10 percent when the anticipated average use is not more frequent than once in 50 years or 25 percent when the anticipated average use is not more than once in 100 years.

The values given will be the upper limit for all grasses. Values for grasses or grass mixtures will be determined by comparison with the values shown, with due consideration given to the growth characteristics and density attained in the local area by the species under consideration.

Where bona fide studies or investigations have been made to determine the permissible velocity for a specific soil, and site, these values may be used in lieu of those shown in Table F-II.

TABLE F-II

PERMISSIBLE VELOCITIES FOR VEGETATED ARTS SPILLWAYS

Grasses or Grass Mixtures		
Soil Type	Slope	Permissible Velocity
Erosion Resistant	0 - 5% 5 - 10%	8.0 fps 7.0 fps
Easily Eroded	0 - 5% 5 - 10%	6.0 fps 5.0 fps

a. Ramp Spillways

The use of ramp spillways is prohibited.

2. Earth Emergency Spillway

The permissible velocity in earth spillways will be chosen after due consideration of the soils involved, the frequency of use of the spillway and other pertinent factors. Table F-III is taken from Fortier and Scobey's study, "Permissible Canal Velocities After Aging", and may be helpful in determining this velocity. The values given for non-cohesive soils are quite applicable and should not be exceeded unless bona fide studies have demonstrated that higher velocities are permissible. The table is not strictly applicable for cohesive soils since it applies to canal beds that are seasoned (perhaps permitting higher velocities) and subject to continuous flow and under conditions where erosion damage cannot be tolerated (requiring lower velocities).

TABLE F-III

PERMISSIBLE CANAL VELOCITIES AFTER AGING*

Original Material Excavated	Feet/Second
Fine sand, non-colloidal	1.50**
Sandy loam, non-colloidal	1.75
Silt loam, non-colloidal	2.00
Alluvial silts, non-colloidal	2.00
Ordinary firm loam	2.50
Volcanic ash	2.50
Fine gravel	2.50
Stiff clay, very colloidal	3.75
Graded, loam to cobbles, non-colloidal	3.75
Alluvial silts, colloidal	3.75
Graded silt to cobbles, colloidal	4.00
Coarse gravel, non-colloidal	4.00
Cobbles and shingles	5.00
Shale and hardpans	6.00

* Recommended in 1926 by Special Committee on Irrigation Research, American Society of Civil Engineers.
** Values shown apply to clear water, no detritus.

On easily erodible soils, consideration should be given to the use of mechanical control on the spillway crest to maintain the elevation and position of the control section.

III. ROCK EMERGENCY SPILLWAYS

Some of the principles used for the layout of earth emergency spillways are applicable to rock emergency spillways. Allowable average frequency of use and permissible velocities must be ascertained for the specific site based on a knowledge of the hardness, condition, durability, and structure of the rock formation. An individual appraisal is necessary to determine the proper roughness coefficient, “n”. In the absence of a complete investigation and a written recommendation to design the spillway as a rock spillway, the material shall be considered earth. A note showing the engineer's recommendation and bearing his seal and signature shall be a part of the plans. Table F-I gives the permissible frequency of use of rock emergency spillways.

IV. STRUCTURAL EMERGENCY SPILLWAYS

Chutes or drops, when used for emergency spillways, will be designed in accordance with the principles set forth in SCS National Engineering Handbook, Section 5, "Hydraulics", Section 11, "Drop Spillways", and Section 14, "Chute Spillways".

All structural concrete shall be designed by a registered professional engineer and shall conform to the latest accepted design codes.

V. WATER SURFACE PROFILE

The design engineer shall compute a complete water surface profile for both the emergency spillway storm and freeboard storm, to include an energy grade line, between the upstream and downstream normal flow depths. This profile shall be a part of the plans and be of such detail as to delineate the required information.

SECTION G - EARTH EMBANKMENTS

I. HEIGHT

The earth embankment will be high enough to prevent overtopping with the most severe of the following conditions: (1) the passage of the freeboard hydrograph or (2) the passage of the emergency spillway hydrograph, plus the necessary freeboard required by the site for frost conditions or wave action.

II. TOP WIDTH

The top width of earth embankments will not be less than the value given by the following equation:

$$W = \frac{H + 35}{5}$$

where H = Height of embankment in feet.
W = Minimum top width of embankment in feet.

III. WAVE EROSION PROTECTION

The earth embankment will be riprapped or other wave protection provided over the full range in stage between the lowest drawdown elevation and at least a few feet above the full normal pond elevation.

SECTION H - UTILITIES UNDER EMBANKMENTS

Existing pipelines, cables and conduits of a wide variety of sizes, materials and functions are frequently encountered at dam sites. These conduits usually are located at shallow depth in flood plain. They constitute a hazard to the safety of the dam and must be (1) relocated away from the site or (2) reconstructed or modified to provide the durability, strength and flexibility equal in all respects to the principal spillway designed for the site.

Every reasonable effort should be made to have such conduits, cables, and pipelines removed from the site. Most utilities and industries will want their facility removed from the site for easy maintenance. Only as a last resort and under the limitations imposed will conduits be permitted to remain under an earth dam embankment.

Conduits permitted to remain under any part of the embankment below the crest of the emergency spillway must be (1) provided with anti-seep collars when the location of the pipe creates a piping potential, (2) properly articulated on all yielding foundations, (3) encased in concrete or otherwise treated to insure durability and strength equal to that of the principal spillway, and (4) made absolutely watertight against leakage either into or out of the pipe.

Enclosure of the conduit, cable or pipeline within another conduit which meets the requirements of this section and which is positively sealed at the upstream end to prevent seepage into the enclosing conduit is acceptable. Such an enclosing conduit will extend the full distance through which the conduit being enclosed is beneath the embankment.

401 KAR 4:030. Design criteria for dams and associated structures.

RELATES TO: KRS 151.250

STATUTORY AUTHORITY: KRS 151.125, 224.01-110(6)(b), 224.10-100(17)

NECESSITY, FUNCTION, AND CONFORMITY: This administrative regulation is necessary to establish minimum design criteria for dams and associated structures constructed in Kentucky.

Section 1. This administrative regulation applies to all dams as defined by KRS 151.100 and to all other impounding obstructions which might create a hazard to life or property.

Section 2. Except as modified in this administrative regulation, the procedures outlined by the latest edition of "Design of Small Dams" (Second Edition, 1973), available from the U.S. Government Printing Office and the Department of Reclamation, herein filed by reference, shall be the minimum criteria.

Section 3. The Division of Water Engineering Memorandum No. 5 (2-1-75) outlined as follows: Section A. Definitions; Section B. Structure Classification; Section C. Hydrologic Criteria; Section D. Sediment Storage; Section E. Principal Spillways; Section F. Emergency Spillways; Section G. Earth Embankments; and Section H. Utilities Under Embankments; is hereby incorporated by reference and made a part of this administrative regulation as if fully set out herein. Copies are available from the Division of Water upon request.

Section 4. Structure types not generally used in Kentucky, i.e. gravity, buttress, steel, timber, etc., will be considered on an individual basis and reviewed in accord with prevailing practices that are currently accepted by the engineering profession.

Section 5. In all cases the safety of the structure, the water and/or other material impounded therein, property and human life will be the principal governing factors. Under no circumstances will the proposed use of the structure and its contents, or the cost of providing an unquestionably safe structure be allowed to assume precedence over the possible hazard involved.

Section 6. Structures which are to be repaired or reconstructed must be made to conform to the criteria established by this administrative regulation.

Section 7. Each of the following stated criteria indicates whether the limit is a maximum or minimum limit and is not to be construed as being satisfactory design criteria at all sites. Professional judgment, state laws and administrative regulations, investigations, or analysis may dictate more conservative criteria.

Section 8. (1) Approval of all plans and specifications shall be divided into two (2) distinct parts:

(a) Issuance of a construction permit pursuant to KRS 151.250 shall constitute approval of the final engineering documents to allow construction to be started; and

(b) Final written approval by the cabinet upon receipt of the "as-built" plans and specifications will constitute approval to impound.

(2) No approval to impound water and/or other material is implied or is in any way granted until the "as-built" plans and specifications have been approved, an on-site inspection has been made, and a written statement of approval issued. It is recommended that the owner and/or his engineer contact this division before initiation of final design for a predesign conference.

Section 9. All plans and specifications submitted for consideration must bear the seal and signature of the responsible engineer as defined in KRS 322.010(2), except officers and employees of the United States Government while engaged in engineering for the government. Each sheet of the drawings shall bear the seal and signature of the engineer or engineers responsible for its preparation.

Section 10. All structures, other than Class A as defined in Engineering Memorandum No. 5 (2-1-75) shall have a complete subsurface investigation and soil analysis submitted as an integral part of the drawings.

Section 11. (1) Elevation area capacity data and elevation discharge data must be submitted as a part of the plans for each structure. This elevation area capacity data shall give the area and capacities from the elevation of the lowest point in the impoundment area to at least the

elevation at the top of the dam. When the configuration of the structure will not allow the elevation discharge relationship to be developed by methods accepted as standard by the engineering profession, the structure must provide the storage necessary to contain the entire storm run-off without probable damage to the structure or creating an unacceptable hazard to life or property.

(2) When this required basic information is furnished by the responsible design engineer, the Division of Water will upon request assist the engineer in preparing the flood routings required by Engineering Memorandum No. 5 (2-1-75).

(3) In the event that the elevation area capacity data is not furnished or the flood routings show that insufficient floodwater storage has been provided, the plans will be returned to the design engineer without being approved.

Section 12. All information concerning elevations shall refer to mean sea level and the use of assumed elevations for any purpose is prohibited. Should an error in either the horizontal control or vertical control become known during construction, the necessary information to correct the distances and the elevations shall be referred to on the first sheet of the "as-built" drawing or referred to in the index. Clearly marked reference points and bench marks shall be maintained at the job site by the responsible engineer until final written approval is received.

Section 13. Unless waived in writing by the cabinet, no structure shall be approved unless a positive means is provided to pass water through the structure in sufficient quantity to satisfy the needs of downstream users and to empty the reservoir within a reasonable length of time. Conditions considered in determining downstream water requirements and required minimum time to empty the impoundment shall be determined by the responsible engineer and referred to on the drawings.

Section 14. Construction supervision and inspection must be performed by or under the direction of the design engineer. Unless otherwise directed by the cabinet the engineer shall submit monthly progress reports on forms to be supplied by the cabinet. Copies of all testing reports shall be submitted with the progress reports.

Section 15. All "as-built" documents shall be submitted by the responsible engineer in the form of permanent type drawings of a standard and uniform size. Variations in size will be permitted for federal agencies in order that they may use their standard drawings. Drawings that do not conform to standard practices or drawings that are not easily legible will not be accepted.

Section 16. Because of the cabinet's statutory duty to review federal projects for the Commonwealth under KRS 151.220, the United States Army Corps of Engineers is exempt from the provisions of this administrative regulation and KRS 151.250. (DOW-Rg-2; 1 Ky.R. 759; eff. 6-11-75.)

AKNOWLEDGEMENTS

The adopted rules and regulations were compiled after reviewing the works of various state and federal agencies and many professional organizations.

Special recognition is made to the following:

State of Oklahoma

State of Texas

State of Arizona

All other States submitting information for our review.

Department of the Army Corps of Engineers

Federal Emergency Management Agency

National Research Council

Committee on the Safety of Existing Dams

United States Committee of Large Dams

Association of State Dam Safety Officials

PREFACE

The Public Works and Flood Control Directorate of the Department of Transportation and Development serves as the Water Resources agency for the State of Louisiana, providing engineering and technical support for the orderly planning and development of programs and projects related to flood control, drainage, irrigation, water diversions, reservoirs, navigation, port development, hurricane protection, coastal engineering, and management and development of water resources.

Act No. 733 of the 1981 Legislature provides for a Dam Safety and Regulatory Program. The Public Works and Flood Control Directorate is charged with the responsibility for administering the program. The program is operated by the DOTD's Water Resources Design and Development Section, with administrative and enforcement authority vested in the Director of the Public Works and Flood Control Directorate.

HISTORY

More than 100 large dams in the United States have failed since 1930. The Baldwin Hills Reservoir near Los Angeles, the Teton Dam in Idaho, and the Barnes Lake Dam in Georgia are some of the better known failures. Dam disasters in the early 1970's, resulting in approximately 355 deaths and extensive property damage, led to the passage of the 1972 National Dam Inspection Act (Public Law 92-367, August 8, 1972). The Secretary of the Army, through the U.S. Army Corps of Engineers, was directed to inspect the majority of the nation's dams for protection of life and property. Yet, through November of 1976 no inspections had been conducted and the Corps recommended to Congress a program which emphasized voluntary state actions to inspect and regulate the 43,000 non-federal dams covered by the act. But, without federal assistance, many states could not conduct such a program.

In the summer of 1977, Congress appropriated $15 million, later increased to $18 million, for inspection of non-federal dams. In December of 1977, following the Barnes Lake Dam disaster which killed 39 persons, the president announced a federal program to inspect non-federal dams under the authority of the 1972 Act. The program's goal was to inspect approximately 9,000 non-federal, highly hazardous dams, at a cost of approximately $93 million. The president indicated that the federally-funded program could not be a substitute for effective dam safety action at the state level, and the program was intended to stimulate the states to action.

The Public Works and Flood Control Directorate was designated as Louisiana's representative in the program. A total of 343 dams were inventoried, of which 6 were classified as highly hazardous to downstream populations. In some instances, remedial measures were recommended to the dam owner for the protection of public safety. But, because Louisiana had no law relating to dam safety, the recommended measures could not be enforced.

With the passage of Act No. 733 of the 1981 Regular Session (LA. R.S. 38:21-28),

Louisiana acknowledged its responsibility of insuring the valuable resource of dams to their surrounding communities and also to protecting the life and property of the communities located downstream of dams, placing Louisiana in proper posture with the nationwide effort for dam safety.

PURPOSE

Simply stated, the purpose of Act No. 733 (LA. R.S. 38:21-28) is to recognize the inherent dangers posed by impoundments of significant volumes of water, and to require that owners of structures which impound water (or other liquids) assume the responsibility for that danger by ensuring that such structures are designed, constructed, and maintained so as to minimize the risk to life and property. Regardless of the circumstances of failure, the owner is ultimately responsible for loss of life and property damages that may occur from the failure of his dam.

The Department of Transportation and Development, Public Works and Flood Control Directorate, is charged with the responsibility for developing and enforcing a regulatory program to ensure that public safety and welfare is not compromised by the presence of dams or other impoundment facilities. The DOTD Dam Safety Program defines the minimum standards for the design, construction, operation, and maintenance of dams in the state of Louisiana, and DOTD has the responsibility and the authority to enforce the standards of the program. This manual documents the minimum standards for design, construction, operation and maintenance of dams and impoundment structures and the policies for the enforcement of those standards.

APPLICABILITY

The regulations of this program will govern the construction, enlargement, alteration or repair, maintenance and operation of all dams as defined by Act No. 733 (LA. R.S. 38:21-28) of the 1981 Regular Session of the Louisiana Legislature. The terms "dam" and "impoundment structure" are used interchangeably and shall mean the embankment, spillway(s), outlet works and other attendant parts. Included are all artificial barriers together with all appurtenant works which impound or divert water or any other liquid and which are:

1. Twenty-five feet or more in height and have an impounding capacity at maximum storage greater than fifteen acre-feet,

or

2. Have an impounding capacity at maximum storage of fifty acre-feet or more and are greater than six feet in height (see Figure 1, Appendix C).

All barriers which are six feet or more in height with maximum storage capacities of fifteen acre-feet or more must be submitted to DOTD for review (see Figure 2, Appendix C). The height of a dam is measured from the natural bed of the stream or watercourse at the downstream toe of the barrier, or if it is not across a stream or watercourse, the height from the lowest elevation of the outside limit of the barrier, to the top of the dam. The capacity at maximum storage is the volume in the reservoir in acre-feet when the water level in the reservoir is at top of dam elevation.

PERMITTING

APPLICATION FOR PERMIT -- A permit from the DOTD will be required prior to constructing any new impoundment structure or commencing any structural modifications to existing impoundment structures (see Appendix A). Permit forms may be obtained from the Director, Public Works and Flood Control Directorate, Louisiana Department of Transportation and Development, P.O. Box 94245, Baton Rouge, Louisiana, 70804-9245. The permitting process is designed to ensure that new structures and modifications to existing structures are designed and constructed in accordance with the requirements documented herein.

NATURAL RESOURCES CONSERVATION SERVICE -- The approval process may be abbreviated if dams meet the requirements of Pond Standard 378 of the Natural Resources Conservation Service National Handbook for Conservation Practices and the Natural Resources Conservation Service's engineering staff provides the design, layout, and construction inspection. In this case, the Natural Resources Conservation Service will certify that the dam design and construction meets the requirements of Pond Standard 378 and they will provide DOTD with the Pond Data Sheet, a map showing the location of the pond, and a letter signed by the owner of the dam (see Appendix D). The Natural Resources Conservation Service will agree to periodically inspect the structure to ensure that Pond Standard 378 is being maintained, and to inform the DOTD if the structure ever falls below Pond Standard 378.
NOTE: Natural Resources Conservation Service formerly the "Soil Conservation Service".

PUBLIC HEARINGS -- After an application has been filed and accepted, the public in the affected locale will be notified by publication in the local news publication. The Director of Public Works and Flood Control will prepare a notice, assigning a date and place for a public hearing of the application. The notice will contain information describing the application and the name and address of the applicant (see Appendix A). It will be the applicant's responsibility to have the notice published once a week for two consecutive weeks in the official journal of the parish in which the project will be constructed, and shall

provide notarized proof of publication on or before the hearing date. The applicant will bear the cost of the publication. The DOTD will conduct the public hearing, and the applicant will be required to attend to describe the nature and purpose of the proposed project and to answer questions.

ISSUANCE OF A PERMIT -- An "Impoundment Permit/Certificate of Completion" shall be issued for all dams, both existing and new construction. The "Impoundment Permit/Certificate of Completion" is not transferable. The owner of a dam must notify the DOTD 30 days prior to transferring ownership of the dam, and must return the "Impoundment Permit/Certificate of Completion" to the DOTD.

FAILURE TO OBTAIN APPROVAL -- If, prior to beginning construction, the owner fails to obtain approval, the owner will be cited and fined under the statutory authority of Louisiana Revised Statute, Title 38, Section 28. Also, the lake may be ordered to be drained until all approvals have been obtained.

SUBMITTALS

All designs for work to be permitted under the program will be submitted for review and approval with all necessary supportive documentation (See Appendix G). Normally, it is expected that an owner or prospective owner will establish contact with the DOTD to apply for a permit to construct or modify a dam. An example of a letter notifying the DOTD of intent to construct or modify a dam is provided in Appendix A. In some cases, however, structures are built and water is impounded without the knowledge or approval of the DOTD. When such structures are discovered, the owners will be contacted by the DOTD and required to furnish documentation that their structure meets the safety requirements of the program. In either case, the applicant will be guided by the Water Resources Design and Development Section throughout the review and approval process. The documentation required will be formal engineering designs and calculations, supported by sufficient field information, and certified by a professional civil engineer registered to practice in Louisiana. Because each step in the design of a dam is dependant upon the quality of the design judgements made in the previous steps, the applicant is advised to coordinate each of the three formal design stages, identified in the next section, with the DOTD review team prior to proceeding to the next step.

After general designs have been approved, the applicant may proceed with plans and specifications, which will also require approval before construction can begin. Plans and specifications will be of professional engineering detail and quality and will include all information and directions necessary to construct the dam in accordance with the design intent.

DESIGN

The proper design of a dam involves a complex combination of engineering applications. It is not within the scope or intent of this document, nor will it be the practice of the staff of DOTD, to instruct in the detailed procedures for the design of a dam. All dams and impoundment structures to be permitted under this program will be designed by a professional civil engineer(s), registered by the Louisiana State Board of Registration for Professional Engineers and Land Surveyors. The registered civil engineer will certify the designs and plans by professional seal. Designs must conform to nationally recognized standards, further explained in the following paragraphs and in the reference material. The completed design package will state the intended design life of the structure, and will include the operations and maintenance procedures necessary to ensure that the structure will function as designed for its stated design life.

Failure of an impoundment structure and the instantaneous release of large volumes of water is referred to as a dam breach and is the primary risk associated with dams, and is the fundamental reason for the state to assume regulatory authority over dams through the Dam Safety Program. Breaching may occur during fair weather due to the cumulative effects of erosion or seepage, or it may occur as a result of stresses caused by excess water produced during a storm event. The hydraulic and hydrologic (H&H) design will determine which of the two scenarios poses the greater hazard, the volume of water which is likely to be released, and the rate of flow.

It is the H&H design which determines the volumes and flow rates with which the impoundment structure(s) must contend. The geotechnical and structural designs must ensure that the impoundment structure(s) can safely accommodate the hydraulic forces imposed by the conditions predicted by the H&H design. Following are the sequential steps which are necessary in any dam/impoundment structure design, and each step must be documented with design calculations and all supporting data, certified by a Registered Professional Civil Engineer:

I. Hydrology and Hydraulics (H&H) Design

A. Impact (Hazard) Classification

B. Determination of controlling design condition and associated storm runoff.

C. Setting of spillway and stilling basin widths and elevations, top of embankment elevation, and normal pool stage.

II. Structural and Geotechnical Design of Embankment, Spillways, and Drawdown Structures.

III. Development and Documentation of Operations and Maintenance Procedures.

Note : For the purpose the Dam Safety Program, the "Emergency Spillway" shall be defined as being overtopped by the 100 year storm or greater and the "Principal Spillway" shall be defined as being overtopped by a storm less than the 100 year storm.

HYDROLOGY AND HYDRAULICS (H&H) DESIGN -- Before the structural design of the dam can begin, the requirements of hydraulic capacity must be determined. The height of the dam, the amount of freeboard above normal pool elevation, the size and

capacity of the principle and emergency spillways, must all be designed to balance the hydrological and hydraulic properties of the location of the reservoir. A properly designed drawdown structure, capable of reducing the stage of the reservoir at a suitable rate in the event of emergency, must also be designed to meet the capacity requirements of the site.

The H&H design begins with the Impact Classification (also referred to as Hazard Classification in some texts) of the dam (See Appendix F). The Impact Classification is determined by an evaluation of the probable maximum impacts of a dam breach. Low impact structures are those for which, because of size and/or location, little or no significant damage to life or property is likely to result from a failure of the structure. Significant impact structures are those which could cause appreciable damage to property or could pose possible threat to human life in the event of failure. High impact structures are those for which failure would cause excessive property damage or make loss of human life likely.

Note: The inflow design flood (IDF) is determined by the various Hydrograph Methods after the precipitation amount is developed. The major source of precipitation data is the National Weather Service (NWS). The DOTD has final authority for approval of the method to be utilized to determine the IDF.

TABLE I
IMPACT CLASSIFICATION AND INFLOW DESIGN FLOOD

IMPACT CATEGORY	POTENTIAL LOSS OF LIFE	POTENTIAL ECONOMIC LOSS	MINIMUM INFLOW DESIGN (IDF)
LOW	NOT LIKELY	MINIMAL	50-Yr. Freq.
SIGNIFICANT	POSSIBLE	APPRECIABLE	100-Yr. Freq.
HIGH	LIKELY	EXCESSIVE	1/2 PMF

Further guidance in assessing the potential hazards and associated impact classification for dams may be found in Reference 1. It is the responsibility of the owner/applicant to establish impact classification, and all dams will be considered to be of High Impact potential until demonstrated to be otherwise by a documented analysis provided by the applicant. The proposed impact classification must be supported by sufficient analysis and documentation, and DOTD will have final authority for assigning Impact Classification.

Having established the Impact Classification for the structure, the next step is to establish the magnitude of the meteorological event on which the entire design is to be based. Dams must be designed to be able to safely withstand the passage of a flood of design magnitude. The **Inflow Design Flood** (IDF) is the largest storm event to be considered in the design of the structure, and the magnitude of the storm event for which

the IDF is computed is related to the Impact Classification. The values shown for IDF in Table I are **minimums**, and the actual storm event to be used as the IDF will be determined by a site specific analysis. For low impact structures, the primary consideration is the protection against loss of the dam and its benefits in the event of failure, while for significant and high impact structures, adequate protection of life and property must be assured.

For dams classified as high impact, the IDF is defined as the flood event above which a breach of the dam does not increase hazard to downstream interests. The upper limit of the IDF for high impact structures is the **Probable Maximum Flood** (PMF), which is the flood which may be expected from the most severe combination of critical meteorological and hydrological conditions which are reasonably possible. While the PMF is the upper limit for the IDF, the IDF for high impact dams may be an event of smaller magnitude, depending upon an incremental hazard assessment, which is a routing of floods of increasingly larger magnitude through the structure and downstream channel reaches, comparing conditions with and without a dam failure, until a flood magnitude is reached for which the dam failure condition does not appreciably increase the hazard potential.

Dams classified as having significant impacts may or may not require a formal incremental hazard evaluation, depending upon the extent of existing and potential downstream development, the size of the reservoir, and the type and use of the dam. The upper limit of the IDF for significant impact structures is the PMF.

For dams with low impact classification, the incremental hazard evaluation is not required, and the IDF can be based upon factors related to loss of service of the dam, potential maintenance costs, etc., but with the 50-Yr. frequency storm being the minimum design event. The Water Resources Design and Development Section should be a partner in establishing the IDF, and designs should not proceed until agreement has been reached between the DOTD and the owner's engineer on the choice of the IDF. Establishing the IDF is the foundation for the entire design process, since the dam must be designed to safely pass and/or contain the IDF. A guideline for performing the incremental hazard evaluation necessary to establish the IDF is provided in Reference 1.

How the IDF is to be safely passed by the dam structure and the stability of the dam against the long-term effects of hydrostatic forces is the subject of the balance of the design effort, including the general configuration of the dam; length, elevation, and composition of principal and emergency spillways; freeboard above normal pool elevation; erosion protection; and stability design. The most practical way of assuring the integrity of the dam during an IDF

is to provide a concrete spillway which is capable of carrying the peak flow of the storm. Principal spillways are normally sized to carry flows from all but the largest of storms, with emergency spillways, which are not normally armored, functioning only during

major storm events. If the peak flow from the IDF can be contained within the principal and emergency spillways, the stability of the dam is not likely to be threatened by the erosive action of water flowing over the embankment. The designer may wish to balance the relative economy of providing spillway capacity versus storage capacity above normal pool stage. But, if design calculations indicate that the embankment will be overtopped by the IDF, provisions must be included in the design to prevent the embankment from failing under the erosive forces of the overtopping flows.

GEOTECHNICAL DESIGN -- It is essential to the stability of the structure that the material used in the impoundment structure, as well as the foundation and adjoining earth have the necessary structural properties to withstand the hydrostatic forces required by the design, that potential for destructive seepage is identified and appropriately dealt with, and that the surfaces of the structure are adequately protected from surface erosion.

Field investigations shall be adequate to define the soils and ground water conditions with respect to stability and seepage control. Stability analysis should consider after-construction conditions, based on the undrained shear strength parameters determined by laboratory tests. Long-term steady seepage, partial pool, and rapid drawdown analyses should also be performed, using shear properties appropriate to the subject materials and minimum safety factors shown in Table II.

TABLE II
FACTOR OF SAFETY
FOR STABILITY ANALYSIS

ANALYSIS CONDITION	FACTOR OF SAFETY
Rapid Drawdown	1.25
Partial Pool	1.40
Steady Seepage	1.40
After Construction	1.30
Earthquake	1.15

STRUCTURAL DESIGN -- Structural Designs are to be prepared in accordance with generally accepted structural engineering practices such as those of the American Concrete Institute, the American Institute of Steel Construction and the American Institute of Timber Construction. Components of the spillway or other appurtenant structures shall be designed to resist the most critical loading combination of dead loads plus live loads that may occur during its construction or design life. Some of the loads which must be considered in the design are: buoyancy forces, sliding forces, hydrostatic uplift forces, bearing forces, overturning forces, water drag forces, wing drag forces, gate-lifting and closing forces, soil and water pressure forces, impact forces, uniform and point live load forces, etc. The minimum factors of safety for buoyancy and sliding shall be 1.5 and 2.0, respectively. The overturning analysis must indicate that the resultant force falls within the center 1/3 of the base. The minimum factor of safety for pile design shall be 2.0.

CONSTRUCTION

It will be the owner's responsibility to ensure by the presence of professional construction supervision personnel that the structure is built in strict compliance with the approved designs and specifications. Adequate records shall be maintained to document that all materials and construction procedures meet or exceed those specified. The owner shall report on the construction to the DOTD. The work of construction, enlargement, alteration, repair or removal of a dam or reservoir for which approved application, designs, plans and specifications are required shall be under the responsible charge of a registered civil engineer. Upon completion of the work and prior to the impoundment of water, the engineer shall certify that all work has been done in compliance with the approved plans and specifications (Appendix A).

During construction, periodic inspections may be made by representatives of DOTD. The owner will be required to provide such works or tests as may be needed to disclose sufficient information to enable DOTD to determine that conformity with approved plans and specifications is being maintained. Inspections made by DOTD are "limited inspections" and do not relieve the owner or the owner's engineer from their responsibilities for conformance to accepted designs and procedures.

MAINTENANCE AND OPERATION

Once in service, the integrity of the impoundment structure must be sustained by regular maintenance, in accordance with the approved Operations and Maintenance document provided by the designer. The Operations and Maintenance Manual should contain forms and schedules for records and documentation of inspections, maintenance procedures, and repairs. The owner will be responsible for certifying, through properly documented records, to the DOTD that the required periodic inspections have been made, for correcting any deficiencies revealed during such inspections, and for maintaining

records of all operations and maintenance activities, as well as of original construction and any subsequent modifications.

An Emergency Preparedness Plan is required for all dams and reservoirs. The plan shall comply with the guidelines of the current issue of Louisiana's "Emergency Action Plan Guidelines", available from the DOTD's Director of Public Works and Flood Control. The Emergency Preparedness Plan will be a condition of the permit for the project, and it will be the owner's responsibility to implement the provisions of the plan in the event of emergency.

INSPECTIONS

The DOTD will periodically inspect every dam in the jurisdiction of the program. The purpose of the DOTD inspections is to ascertain whether the structure is being properly maintained in accordance with the approved Operations and Maintenance procedures. DOTD inspections are limited inspections and do not relieve the owner of responsibility to perform and document periodic inspections. If an inspection by DOTD reveals that a dam is unsafe or in danger of becoming unsafe, the DOTD, through the Director of Public Works and Flood Control, shall direct the owner to take whatever action is necessary to restore the dam to its design condition.

The owner has the primary responsibility for insuring the safe condition of the structure by regular maintenance and periodic inspection. The owner is required to immediately inform the Director of Public Works and Flood Control of any unusual circumstances or occurrences which may affect the condition or safety of the reservoir. Also, the Director will be notified prior to any planned draw downs of the reservoir.

ENFORCEMENT

If any dam or impoundment structure is determined to be unsafe, the Director of Public Works and Flood Control for the Department of Transportation and Development, pursuant to La R.S. 38:21-28, shall direct any such repairs or remediations for a dam or impoundment structure as he deems necessary to ensure that life and property is not unduly threatened by the impoundment. Such remedial action may include (1) directing that the water level behind the structure be lowered to a safe level, or (2) that the impoundment be completely drained until all necessary corrections to the structure have been made.

EXISTING STRUCTURES

All dams constructed or under construction prior to the promulgation of these rules will be reviewed to assess their disposition under the program regulations. Each dam is unique and must be judged on the basis of its own particular set of circumstances. Based on the circumstances of each individual case, a judgement will be made of what modifications or repairs are necessary to meet program standards. It is the intent of the program to eventually have every dam upgraded to meet program standards. DOTD will be the sole judge of whether an existing deficiency creates an unacceptable risk to the

general public. While it is not the intent of this program to lower the standards for existing dams, DOTD recognizes that it is not practical to force all dam owners to immediately retrofit their structures to meet new minimum Inflow Design Flood standards.

An "Impoundment Permit" is required for existing dams and will be issued after reviewing all historical data (designs, plans, specifications, operation and maintenance records, etc.) and performing a technical inspection (or inspections) to adequately assess the safety of the dam. The owner shall provide all historical data, if available.

EMERGENCY PREPAREDNESS PLAN

An **Emergency Preparedness Plan** is required for all dams and reservoirs both existing and new construction (See page 21, "Existing Structures"). The plan will comply with the guidelines of the current issue of Louisiana's "Emergency Action Plan Guidelines", available from the Director of Public Works and Flood Control, and shall be submitted as a necessary component of the Maintenance and Operating Procedures as a condition of the permitting process. It is the owner's responsibility that the provisions of the Emergency Action Plan are implemented in the event of an emergency situation.

A breach analysis is required to develop the emergency preparedness plan. The breach analysis will establish the magnitude of the inundated area (inundation map), peak flood elevations and arrival times of the peak flood elevations at critical locations. The worst case scenario breaching event will be somewhere between the "sunny day" breach and that event above which a breach of the dam does not increase hazard to downstream interests. If the dam owner wants to perform only one breach analysis instead of doing incremental analyses to find the worst case scenario breaching event, he can perform a breach analysis where the tail water is at the average annual elevation and the reservoir is at maximum design surcharge.

APPENDIX A
LETTERS, FORMS, PUBLIC NOTICE AND PERMITS

LETTER OF INTENT

Purpose: To notify the Louisiana State Dam Safety Program of the applicant's intent to construct, enlarge, alter, repair or remove a dam within the state.

Address To: Louisiana State Dam Safety Program
Louisiana Department of Transportation and Development
Public Works and Flood Control Directorate
Post Office Box 94245
Baton Rouge, Louisiana 70804-9245

Contents: 1) Name of proposed or existing dam

2) Purpose of dam

3) Owner's:
Name

Address

Telephone

4) Location of dam (section, township, range, parish)

5) Brief description of proposed dam construction, enlargement, alteration, repair or removal

*6) Height of Dam (height in feet from top of dam to lowest point at downstream toe of dam)

*7) Reservoir Capacity (volume in acre-feet with water at top of dam)

*NOTE: Items 6 and 7 can be approximated at this time.

Letters of No Objection and Other Permits

The applicant must forward copies of the pre-application to the appropriate state, federal and local agencies to obtain letters of no objection and/or permits as required by these agencies. Copies of the letters of no objection and permits must be submitted to the Louisiana State Dam Safety Program as part of the applicant's application under this program.

Pursuant to the rules and regulations of the State Dam Safety Program as established by Act No. 733 of the 1981 Regular Session, interested parties are hereby notified that a "Letter of Intent" and a "Pre-Application for Construction of Dam" have been received by the Director, Public Works and Flood Control Directorate, Department of Transportation and Development to construct the proposed
Dam and Reservoir Pre-Application Number PA_____ located in Section____ Township) _, Range____,_____ Parish.

Applicant:

(Name)

(Address)

(Phone)

Purpose and Brief Description of Dam:

All interested parties are hereby notified that a public hearing on the application will be held at p.m. on _____ at _ . Any interested party shall have the right to request a public hearing on the application. Requests for public hearings must be in writing and must be submitted no later than the close of the public hearing on _____ .Letters
must state, with particularity, the reasons for holding a public hearing, applicant's name and Pre-application number. Upon receiving a written request for a hearing within the time limits set forth in

this notice, the Director, Public Works and Flood Control Directorate, shall set a date, time and place for conducting a hearing on the application. During the hearings, any interested party shall have the right to protest the application and to appear and present evidence and testimony in support of such protest.

Letter for Approval of Construction

Purpose: To notify the applicant of the "Approval for Construction" of his "Application for Construction of Dam".

Address To: Applicant with copy to applicant's consulting engineering firm.

Letter of "Notice of Completion and As-Built Drawing

Purpose: To notify the Louisiana State Dam Safety Program that the construction of the subject project is complete and to certify that said construction was done in accordance with the approved designs, plans, drawings and specifications.

From: Applicant's Consulting Engineering Firm (letter must be signed and sealed by a Registered Professional Civil Engineer licensed in the State of Louisiana).

Address To: Louisiana State Dam Safety Program
Louisiana Department of Transportation and Development
Public Works and Flood Control Directorate
Post Office Box 94245
Baton Rouge, Louisiana 70804-9245

Note: As-Built Drawings must be received by the Director, Public Works and Flood Control Directorate, within 30 days after completion.

Private Impoundment Permit
(Certificate of Completion

Purpose: Authorizes the Owner of a Dam and Reservoir to impound water at his facility. Certifies that the applicant has met all requirements under the State Dam Safety Program (see sample next page).

APPENDIX B
RECOMMENDED GLOSSARY

ABUTMENTS - Those portions of the valley sides which underlie and support the dam structure, and are usually also considered to include the valley sides immediately upstream and downstream from the dam.

AUXILIARY OR EMERGENCY SPILLWAYS - A secondary spillway designed to operate only during unusually large storm events. Louisiana's dam safety program defines " unusually large storm events" as being equal to the 100 year storm event or larger.

BAFFLE BLOCKS - Baffle blocks are blocks constructed in a stilling basin to dissipate the energy of fast flowing water.

BERM - The berm of the dam is a horizontal step in a sloping profile. The berm is usually constructed with a slight slope for drainage purposes. The berm is often referred to as a seepage or stability berm.

BLANKET DRAIN - The blanket drain is a horizontal pervious zone located downstream of the impervious core. This zone is often referred to as a sand blanket.

BREACH - An eroded opening through a dam that drains the reservoir. A controlled breach is an intentionally constructed opening. An uncontrolled breach is an unintentional opening that allows uncontrolled discharge from the reservoir.

CHIMNEY DRAIN - The chimney drain is a vertical pervious zone located just downstream of the impervious core. The chimney drain is usually constructed with a sand material.

COFFERDAM - A temporary structure enclosing all or part of the construction area so that the construction can proceed in the dry.

CONDUIT - A conduit is a closed channel to convey discharges through or under a dam. The conduit can be a reinforced concrete pipe, a corrugated metal pipe or a single or multi-barrel reinforced concrete box culvert.

CREST LENGTH OF DAM - The crest length of the dam is the length of the top of dam. This length includes the spillway(s) and other appurtenant structures. The crest length of dam is basically the length from where the top of dam terminates on one abutment to a similar point on the other abutment.

CUTOFF TRENCH - The cutoff trench is an impervious barrier built into the foundation to reduce seepage under the dam. A cutoff wall or slurry wall could be used as a seepage barrier. The slurry wall is relatively thinner in the horizontal direction when compared to a clay core cutoff trench.

DAM - A dam is any artificial barrier, including appurtenant works, which does or will impound or divert water or any other liquid substance.

DOWNSTREAM SLOPE - The inclined surface of an embankment dam that faces away from the reservoir.

DRAWDOWN STRUCTURE - A drawdown structure is a low level outlet which can be used to lower the reservoir below normal pool stage. This may be necessary for lake management purposes, routine repairs or dam safety purposes.

EARTHFILL DAM - A dam constructed predominantly of fine-grained material. Earthfill dams are also known as rolled fill dams where material is placed in layers and compacted by using rollers or rolling equipment.

END SILL - The end sill is the area at the upstream and downstream end of the stilling basin base slab.

FOUNDATION OF DAM - The foundation of the dam is the natural material on which the dam is placed.

HEEL OF DAM - The heel of the dam is the junction of the upstream slope with the foundation. The heel of the dam is often referred to as the upstream toe.

IMPERVIOUS CORE - The impervious core is a zone of low permeability material. This zone is the water or seepage barrier and is often referred to as the clay core.

INTAKE STRUCTURE - The structure placed at the beginning of an outlet works waterway. The intake structure establishes the ultimate drawdown level of the reservoir by the position of its opening(s) to the outlet works. Intake structures may be vertical or inclined towers (drop inlets).

MAXIMUM CROSS SECTION DAM - Cross section of a dam at the point where the height of the dam is a maximum.

NON-OVERFLOW WALL - Non-overflow walls are walls which are usually constructed parallel to the spillway crest at an elevation equal to the top of dam elevation. These wall

are not designed to be overtopped and are often referred to as a closed dam section.

NORMAL POOL STAGE - Normal pool stage for controlled spillways is defined as the water level at the dam to which water may rise under normal operating conditions. This does not include flood surcharge.

OUTLET GATE - The outlet gate is a gate on the drawdown structure or spillway which is used to control the outflow of water. These gates are usually located on the upstream end of the drawdown structure, however, they can be located of the downstream end.

RIPRAP - Riprap is a layer of large uncoursed stones, broken rock or precast blocks placed in a random fashion on the upstream slope of the dam and stilling basin outlets. Riprap is a flexible type of slope protection which will deform if material is displaced from beneath.

PIPING -The progressive internal erosion of an embankment, foundation, or abutment material. The erosion (piping) begins on the downstream side and progresses upstream.

PROBABLE MAXIMUM FLOOD (PMP) -The flood that may be expected from the most severe combination of critical meteorologic conditions that are possible in the region.

PRIMARY OR PRINCIPAL SPILLWAYS - Primary or principal spillways are the first used spillway during flood flows.

RETAINING/TRAINING WALLS - Retaining/training walls are walls which are usually constructed perpendicular to the spillway crest. Retaining walls are walls which support an overturning load. Training walls are walls which confine or guide the flow of water. In many instances, these walls serve both purposes and can be referred to as either a retraining or training wall.

RISER - A type of drop inlet spillway with a vertical section of metal or concrete pipe that allows the reservoir to rise to a predetermined level before water flows into the pipe.

SLOPE - The embankment slope is the inclined face of the embankment spillway, channel. The slope can be an upstream slope or a downstream slope. The upstream slope is on the lake or reservoir side of the dam.

SLOPE PROTECTION - Slope protection is protection against wave action or erosion. The two most common types of slope protection, are riprap and soil cement.

SLUICE - A low-level opening for releasing water from a dam.

SOIL CEMENT - Soil cement is a well compacted mixture of soil, portland cement and water that produces a hard pavement. Soil cement is usually placed in horizontal layers. Soil cement is a rigid type of slope protection which attempts to span voids.

SPILLWAY CREST - The spillway crest is the overflow section or weir section of the spillway.

STILLING BASIN - A stilling basin is a basin constructed to dissipate the energy of fast flowing water. The stilling basin area is located just downstream of the spillway crest between the training/retaining walls.

STRUCTURAL HEIGHT - The distance between the lowest point in the excavated foundation and the top of the dam.

SURCHARGE/FLOOD SURCHARGE - Surcharge/flood surcharge is the volume or space between normal pool and the maximum water level.

TAILWATER - Tailwater is the level of water immediately downstream of the dam.

TOE OF DAM - The toe of the dam is the junction of the downstream slope with the foundation. The toe of the dam is often referred to as the downstream toe.

TOP OF DAM/CROWN - The top of dam is the uppermost surface of the dam. The top of dam can also be referred to as the crest of the dam. When the term "crest" is used, it must be specified that it is the "crest of the dam" and not the "crest of the spillway".

UNCONTROLLED OR UNGATED SPILLWAYS - Uncontrolled or ungated spillways are spillways where the flows over the spillway crest are controlled only by the elevation of the spillway crest. This type of spillway is often referred to as a fixed crest spillway.
Normal pool stage for uncontrolled spillways is defined as the lowest crest elevation of the principal spillway.

UPSTREAM SLOPE - The inclined surface of an embankment dam that is in contact with the reservoir.

APPENDIX D
FORM LETTER FROM OWNER OF A DAM

DATE:

Dam Safety Administrator
Louisiana DOTD
P. O. Box 94245, Capitol Station
Baton Rouge, Louisiana 70804-9245

RE: Pond Construction

I am aware that the design, construction and operation of all dams within Louisiana is regulated by the Rules and Regulations for Dam Safety Program as developed by the State of Louisiana, Department of Transportation and Development. I am also aware of the liability that is associated with owning a dam.

Since I am receiving design and construction assistance from the Natural Resources Conservation Service, formerly Soil Conservation Service, the dam described below is excluded from the approval process outlined in the Dam Safety Regulations. However, if for some reason (such as a land use change) the dam no longer comes within the criteria of the Soil Conservation Service National Handbook for Conservation Practices - Standard 378, I agree to modify the structure if necessary to comply with the requirements of the Dam Safety Regulations. I also agree to allow access for inspection of this structure.

Sincerely,

OWNER

DAM LOCATION:

APPENDIX E
PROCEDURAL SEQUENCE

(New Construction)

1. Applicant or his Engineer submits "Letter of Intent"

2. Applicant or his Engineer submits "Pre-Application for Construction of Dam"
3. Applicant publishes "Notice of Application" and a "Public Hearing(s)" is (are) held
4. Applicant or his Engineer completes "Designs, Plans and Specifications" as follows and submit "Application for Construction of Dams"
    a. "Impact (Hazard) Classification
    b. Determination of controlling design condition and associated storm runoff
    c. Setting of spillway and stilling basin widths and elevations, top of embankment elevation, and normal pool stage
    d. Plans, Specifications, Designs and other Submittals
5. DOTD issues "Approval or Denial of Application"; Approval is an "Approval for Construction"
6. Construction begins; Applicant or his Engineer and DOTD performs "Construction Inspections"
7. If "Deficiencies" are found by DOTD, Applicant or Applicant's Engineer; Applicant or his Engineer correct the deficiencies
8. Supervision of Construction by Owner
9. Applicant or his Engineer submits "Notice of Completion" and "As-Built Drawings" and final "Application for Construction of Dam"
10. DOTD issues "Certificate of Completion/Impoundment Permit"
11. Applicant or his Engineer submits "Maintenance and Operation Procedures" for DOTD's approval
12. Applicant or his Engineer submits "Emergency Preparedness Plan" for DOTD's approval

APPENDIX F
MINIMUM HYDROLOGIC AND HYDRAULIC SUBMITTALS TO ESTABLISH IMPACT CLASSIFICATION AND INFLOW DESIGN FILE (IDF)

Since the required submittals may vary for each dam, we recommend that you obtain copies of references number 1 and 2 on page 25 of the Dam Safety Rules and Regulations. After reviewing these documents, we would advise that you contact the Hydraulic Unit of the DOTD for further guidance.

APPENDIX G
MINIMUM REQUIRED SUBMITTALS

1) All structural, geotechnical, hydrologic and hydraulic design calculations. An engineer's report shall also be submitted which summarizes the design analyses and shall include, but is not limited to, the following:

   a) Formulas, methods and basic data assumptions used in the designs.

   b) List of all pertinent design codes.

   c) Summary tables which list design load cases, computed design factors of safety and required factors of safety as specified in these Rules and Regulations or required by pertinent design codes.

   d) All other information which aided in evaluating the design, supported assumptions and conclusions, and will facilitate an independent review.

2) Plans with sufficient details to construct all features of the dam in accordance with the design intent. Also, the plans shall include details to construct a permanent reference mark (bench mark) near, but separate from, the project. The exact location and elevation above mean sea level must be noted on the "As-Built" plans.

3) Specifications with sufficient details to construct all features of the dam in accordance with the design intent. The specifications shall also provide that the plans and specifications may not be changed without prior written approval by the DOTD.

4) Document(s) to show proof of ownership.

5) An inspection plan specific to the construction activity. The inspection plan is to

detect deficiencies or situations that may result in a threat to life and property.

6) An emergency action plan specific to the construction activity. The inspection plan in item 5 is part of the emergency action plan under this item.

7) If the applicant has an agreement or contract with another entity who will be responsible for the operation and maintenance of the dam, the applicant must provide copies of the agreement or contract document(s).

8) If the applicant is constructing the dam for the specific purpose of transferring ownership to a homeowners' association, a landowners' association, or any other entity, the applicant must provide a document which clearly states his intent, i.e., a dam which is constructed for a subdivision development where ownership will be transferred to a homeowners' association.

9) All other "Permits" required to construct the dam and "Letters of No Objection" which were obtained from various regulatory entities.

10) "As-Built" plans.

11) "Operation and Maintenance Manual".

12) "Emergency Preparedness Plan".

NOTE: The applicant should submit 2 copies of all preliminary submittals. The applicant must submit 5 copies of all final submittals.

Chapter 21. Dam Safety Program

§2101. Dam Safety

A. Introduction

1. The Public Works and Flood Control Directorate of the Department of Transportation and Development (DOTD) serves as the Water Resources agency for the state of Louisiana, providing engineering and technical support for the orderly planning and development of programs and projects related to flood control, drainage, irrigation, water diversions, reservoirs, navigation, port development, hurricane protection, coastal engineering, and management and development of water resources.

2. R.S. 38:21-28 legislation provides for a Dam Safety and Regulatory Program. The Public Works and Flood Control Directorate is charged with the responsibility for administering the program. The program is operated by the DOTD's Water Resources Design and Development Section, with administrative and enforcement authority vested in the Director of the Public Works and Flood Control Directorate.

B. Purpose. The purpose of R.S. 38:21-28 is to recognize the inherent dangers posed by impoundments of significant volumes of water, and to require that owners of structures which impound water (or other liquids) assume the responsibility for that danger by ensuring that such structures are designed, constructed, and maintained so as to minimize the risk to life and property. Regardless of the circumstances of failure, the owner is ultimately responsible for loss of life and property damages that may occur from the failure of his dam. The Department of Transportation and Development, Public Works and Flood Control Directorate, is charged with the responsibility for developing and enforcing a regulatory program to ensure that public safety and welfare is not compromised by the presence of dams or other impoundment facilities. The Louisiana Dam Safety Program defines the minimum standards for the design, construction, operation, and maintenance of dams in the state of Louisiana, and the DOTD has the responsibility and the authority to enforce the standards of the program. This rule documents the minimum standards for design, construction, operation and maintenance of dams and impoundment structures and the policies for the enforcement of those standards.

C. Glossary

*Abutments***C**those portions of the valley sides which underlie and support the dam structure, and are usually also considered to include the valley sides immediately upstream and downstream from the dam.

Auxiliary or *Emergency Spillway***C**a secondary spillway designed to operate only during unusually large storm events. Louisiana's Dam Safety Program defines " unusually large storm events" as being equal to the 100 year storm event or larger.

*Baffle Blocks***C**blocks constructed in a stilling basin to dissipate the energy of fast flowing water.

*Berm***C**a horizontal step in a sloping profile. The berm is usually constructed with a slight slope for drainage purposes. The berm is often referred to as a seepage or stability berm.

*Blanket Drain***C**a horizontal pervious zone located downstream of the impervious core. This zone is often referred to as a sand blanket.

*Breach***C**an eroded opening through a dam that drains the reservoir. A controlled breach is an intentionally constructed opening. An uncontrolled breach is an unintentional opening that allows uncontrolled discharge from the reservoir.

*Chimney Drain***C**a vertical pervious zone located just downstream of the impervious core. The chimney drain is usually constructed with a sand material.

*Cofferdam***C**a temporary structure enclosing all or part of the construction area so that the construction can proceed in the dry.

*Conduit***C**a closed channel to convey discharges through or under a dam. The conduit can be a reinforced concrete pipe, a corrugated metal pipe or a single or multi-barrel reinforced concrete box culvert.

*Crest Length of Dam***C**the length of the top of dam. This length includes the spillway(s) and other appurtenant structures. The crest length of dam is basically the length from where the top of dam terminates on one abutment to a similar point on the other abutment.

*Cutoff Trench***C**an impervious barrier built into the foundation to reduce seepage under the dam. A cutoff wall or slurry wall could be used as a seepage barrier. The slurry wall is relatively thinner in the horizontal direction when compared to a clay core cutoff trench.

*Dam***C**any artificial barrier, including appurtenant works, which does or will impound or divert water or any other liquid substance.

*Downstream Slope***C**the inclined surface of an embankment dam that faces away from the reservoir.

*Drawdown Structure***C**a low-level outlet which can be used to lower the reservoir below normal pool stage. This may be necessary for lake management purposes, routine repairs or dam safety purposes.

*Earthfill Dam***C**a dam constructed predominantly of fine-grained material. Earthfill dams are also known as rolled fill dams where material is placed in layers and compacted by using rollers or rolling equipment.

*End Sill***C**the area at the upstream and downstream end of the stilling basin base slab.

*Foundation of Dam***C**the natural material on which the dam is placed.

*Heel of Dam***C**the junction of the upstream slope with the foundation. The heel of the dam is often referred to as the upstream toe.

*Impervious Core***C**a zone of low permeability material. This zone is the water or seepage barrier and is often referred to as the clay core.

*Intake Structure***C**the structure placed at the beginning of an outlet works waterway. The intake structure establishes the ultimate drawdown level of the reservoir by the position of its opening(s) to the outlet works. Intake structures may be vertical or inclined towers (drop inlets).

*Maximum Cross Section of Dam***C**cross section of a dam at the point where the height of the dam is at it's maximum.

*Maximum Storage Capacity***C**the capacity at maximum storage is the volume in the reservoir in acre-feet when the level in the reservoir is at top of dam elevation.

*Non-Overflow Wall***C**a wall which is usually constructed parallel to the spillway crest at an elevation equal to the top of dam elevation. This wall is not designed to be overtopped and are often referred to as a closed dam section.

*Normal Pool Stage***C**the water level at the dam to which water may rise under normal operating conditions and for uncontrolled spillways is defined as the lowest crest elevation of the principal spillway. This does not include flood surcharge.

*Outlet Gate***C**a gate on the drawdown structure or spillway which is used to control the outflow of water.

*Piping***C**the progressive internal erosion of an embankment, foundation, or abutment material. The erosion (piping) begins on the downstream side and progresses upstream.

Primary or *Principal Spillway***C**the first used spillway during flood flows.

*Probable Maximum Flood (PMF)***C**the flood that may be expected from the most severe combination of critical meteorologic conditions that are possible in the region.

*Retaining/Training Walls***C**walls which are usually constructed perpendicular to the spillway crest. Retaining walls are walls which support an overturning load. Training walls are walls which confine or guide the flow of water. In many instances, these walls serve both purposes and can be referred to as either a retaining or training wall.

*Riprap***C**a layer of large uncoursed stones, broken rock or precast blocks placed in a random fashion on the upstream slope of the dam and stilling basin outlets. Riprap is a flexible type of slope protection which will deform if material is displaced from beneath.

*Riser***C**a type of drop inlet spillway with a vertical section of metal or concrete pipe that allows the reservoir to rise to a predetermined level before water flows into the pipe.

*Slope Protection***C**protection against wave action or erosion. The two most common types of slope protection, are riprap and soil cement.

*Sluice***C**a low-level opening for releasing water from a dam.

*Soil Cement***C**a well compacted mixture of soil, portland cement and water that produces a hard pavement. Soil cement is usually placed in horizontal layers. Soil cement is a rigid type of slope protection which attempts to span voids.

*Spillway Crest***C**the overflow section or top of weir section of the spillway.

*Stilling Basin***C**a basin constructed to dissipate the energy of fast flowing water. The stilling basin area is located just downstream of the spillway crest between the training/retaining walls.

*Structural Height***C**the distance between the lowest point in the excavated foundation and the top of the dam.

*Surcharge/Flood Surcharge***C**the volume or space between normal pool and the maximum design water level.

*Tailwater***C**the level of water immediately downstream of the dam.

*Toe of Dam***C**the junction of the downstream slope with the foundation. The toe of the dam is often referred to as the downstream toe.

*Top of Dam/Crown***C**the uppermost surface of the dam.The top of dam can also be referred to as the crest of the dam. When the term "crest" is used, it must be specified that it is the "crest of the dam" and not the "crest of the spillway."

Uncontrolled or *Ungated Spillways***C**spillways where the flows over the spillway crest are controlled only by the elevation of the spillway crest. This type of spillway is often referred to as a fixed crest spillway. *Normal Pool Stage* for uncontrolled spillways is defined as the lowest crest elevation of the principal spillway.

*Upstream Slope***C**the inclined surface of an embankment dam that is in contact with the reservoir.

D. Applicability

1. The regulations of this program will govern the construction, enlargement, alteration or repair, maintenance and operation of all dams as defined by R.S. 38:21-28. The terms *dam* and *impoundment structure* are used interchangeably and shall mean the embankment, spillway(s), outlet works and other attendant parts. Included are all artificial barriers together with all appurtenant works which impound or divert water or any other liquid and which are:

a. twenty-five feet or more in height and have an impounding capacity at maximum storage greater than 15 acre-feet, (See LAC 70:XIII.2103.A) or;

b. have an impounding capacity at maximum storage of 50 acre-feet or more and are greater than 6 feet in height (See LAC 70:XIII.2103.A).

2. All barriers which are 6 feet or more in height with maximum storage capacities of 15 acre-feet or more must be submitted to the DOTD for review (See LAC 70:XIII.2103.B). The height of a dam is measured from the natural bed of the stream or watercourse at the downstream toe of the barrier, or if it is not across a stream or watercourse, the height from the lowest elevation of the outside limit of the barrier, to the top of the dam.

E. Permitting

1. Application for Permit. Written approval for construction from the DOTD will be required prior to constructing any new impoundment structure or commencing any structural modifications to existing impoundment structures. Permit forms may be obtained from the Director, Public Works and Flood Control Directorate, Louisiana Department of Transportation and Development, Box 94245, Baton Rouge, LA, 70804-9245. The permitting process is intended to ensure that new structures and modifications to existing structures are designed and constructed in accordance with the requirements documented herein. (See LAC 70:XIII.2103.C)

2. National Resources Conservation Service (NRCS), formally called Soil Conservation Service (SCS). The approval process may be abbreviated if dams meet the requirements of "Pond Standard 378" of the National Resources Conservation Service *National Handbook for Conservation Practices* and the National Resources Conservation Service's engineering staff provides the design, layout, and construction inspection. In this case, the National Resources Conservation Service will certify that the dam design and construction meets the requirements of "Pond Standard 378" and they will provide the DOTD with the Pond Data Sheet, a map showing the location of the pond, and a letter signed by the owner of the dam (See LAC 70:XIII.2103.D). The National Resources Conservation Service will agree to periodically inspect the structure to ensure that "Pond Standard 378" is being maintained, and to inform the DOTD if the structure ever falls below "Pond Standard 378."

3. Public Hearings. After an application has been filed and accepted, the public in the affected locale will be notified by publication in the local news publication. The Director of Public Works and Flood Control will prepare a notice, assigning a date and place for a public hearing of the application. The notice will contain information describing the application and the name and address of the applicant (See LAC 70:XIII.2103.E). It will be the applicant's responsibility to have the notice published once a week for two consecutive weeks in the official journal of the parish in which the project will be constructed, and shall provide notarized proof of publication on or before the hearing date. The applicant will bear the cost of the publication. The DOTD will conduct the public hearing, and the applicant will be required to attend to describe the nature and purpose of the proposed project and to answer questions.

4. Issuance of a Permit. An "Impoundment Permit/Certificate of Completion" shall be issued for all dams, both existing and new construction. The "Impoundment Permit/Certificate of Completion" is not

transferable. The owner of a dam must notify the DOTD 30 days prior to transferring ownership of the dam, and must return the "Impoundment Permit/Certificate of Completion" to the DOTD.

5. Failure to Obtain Approval. If, prior to beginning construction, the owner fails to obtain approval, the owner will be cited and fined under the statutory authority of R.S. 38:28. Also, the lake may be ordered to be drained until all approvals have been obtained.

F. Submittals

1. All designs for work to be permitted under the program will be submitted for review and approval with all necessary supportive documentation (See LAC 70:XIII.2103.F). Normally it is expected that an owner or prospective owner will establish contact with the DOTD to apply for a permit to construct or modify a dam. An example of a letter notifying the DOTD of intent to construct or modify a dam is provided (See LAC 70:XIII.2103.G). In some cases, however, structures are built and water is impounded without the knowledge or approval of the DOTD. When such structures are discovered, the owners will be contacted by the DOTD and required to furnish documentation that their structure meets the safety requirements of the program. In either case, the applicant shall be guided by the Water Resources Design and Development Section throughout the review and approval process. The documentation required shall be formal engineering designs and calculations, supported by sufficient field information, and certified by a professional civil engineer registered to practice in Louisiana. Because each step in the design of a dam is dependant upon the quality of the design judgments made in the previous steps, the applicant is advised to coordinate each of the design stages identified in the next Section with the DOTD review team prior to proceeding to the next step.

2. After general designs have been approved, the applicant may proceed with plans and specifications, which will also require approval before construction can begin. Plans and specifications will be of professional engineering detail and quality and will include all information and directions necessary to construct the dam in accordance with the design intent.

G. Design

1. The proper design of a dam involves a complex combination of engineering applications. It is not within the scope or intent of this document, nor will it be the practice of the staff of the DOTD, to instruct in the detailed procedures for the design of a dam. All dams and impoundment structures to be permitted under this program will be designed by a professional civil engineer(s), registered by the Louisiana State Board of Registration for Professional Engineers and Land Surveyors. The registered civil engineer will certify the designs and plans by professional seal. Designs must conform to nationally recognized standards, further explained in the following Paragraphs and in the Appendices. The completed design package will state the intended design life of the structure, and will include the operations and maintenance procedures necessary to ensure that the structure will function as designed for its stated design life.

2. Failure of an impoundment structure and the instantaneous release of large volumes of water is referred to as a dam breach. It is the primary risk associated with dams, and is the fundamental reason for the state to assume regulatory authority over dams through the Louisiana Dam Safety Program. Breaching may occur during fair weather due to the cumulative effects of erosion or seepage, or it may occur as a result of stresses caused by excess water produced during a storm event. The hydraulic and hydrologic (H and H) design will determine which of the two scenarios poses the greater hazard, the volume of water which is likely to be released, and the rate of flow.

3. It is the H and H design which determines the volumes and flow rates with which the impoundment structure(s) must contend. The geotechnical and structural designs must ensure that the impoundment structure(s) can safely accommodate the hydraulic forces imposed by the conditions predicted by the H and H design. Following are the sequential steps which are necessary in any dam/impoundment structure design, and each step must be documented with design calculations and all supporting data, certified by a Registered Professional Civil Engineer:

a. Hydrology and Hydraulics (H and H) Design

i. Impact (Hazard) Classification.

ii. Determination of controlling design condition and associated storm runoff.

iii. Setting of spillway and stilling basin widths and elevations, top of embankment elevation, and normal pool stage.

b. Structural and geotechnical design of embankment, spillways, and drawdown structures.

c. Development and documentation of operations and maintenance procedures.

NOTE: For the purpose of the Dam Safety Program, the "Emergency Spillway" shall be defined as being overtopped by the 100-year storm or greater and the "Principal Spillway" shall be defined as being overtopped by a storm less than the 100-year storm.

4. Hydrology and Hydraulics (H and H) Design

a. Before the structural design of the dam can begin, the requirements of hydraulic capacity must be determined. The height of the dam, the amount of freeboard above normal pool elevation, the size and capacity of the principle and emergency spillways, must all be designed to balance the hydrological and hydraulic properties of the location of the reservoir. A properly designed drawdown structure, capable of reducing the stage of the reservoir at a suitable rate in the event of emergency, must also be designed to meet the capacity requirements of the site.

b. H and H design begins with the Impact Classification (also referred to as Hazard Classification in some texts) of the dam. The Impact Classification is

determined by an evaluation of the probable maximum impacts of a dam breach. Low impact structures are those for which, because of size and/or location, little or no significant damage to life or property is likely to result from a failure of the structure. Significant impact structures are those which could cause appreciable damage to property or could pose possible threat to human life in the event of failure. High impact structures are those for which failure would cause excessive property damage or make loss of human life likely.

NOTE: The inflow design flood (IDF) is determined by the various Hydrograph Methods after the precipitation amount is developed. The major source of precipitation data is the National Weather Service (NWS). The DOTD has final authority for approval of the method to be utilized to determine the IDF.

Table 1. Impact Classification and Inflow Design Flood

Impact Category	Potential Loss of Life	Potential Economic Loss	Minimum Inflow Design (IDF)
Low	Not Likely	Minimal	50-Yr. Freq.
Significant	Possible	Appreciable	100-Yr. Freq.
High	Likely	Excessive	1/2 PMF

c. Further guidance in assessing the potential hazards and associated impact classification for dams may be found in the publication referred to in Subsection N. It is the responsibility of the owner/applicant to establish impact classification, and all dams will be considered to be of High Impact potential until demonstrated to be otherwise by a documented analysis provided by the applicant. The proposed impact classification must be supported by sufficient analysis and documentation, and the DOTD will have final authority for assigning Impact Classification.

d. Having established the Impact Classification for the structure, the next step is to establish the magnitude of the meteorological event on which the entire design is to be based. Dams must be designed to be able to safely withstand the passage of a flood of design magnitude. The Inflow Design Flood (IDF) is the largest storm event to be considered in the design of the structure, and the magnitude of the storm event for which the IDF is computed is related to the Impact Classification. The values shown for IDF in Table I are minimums, and the storm event to be used as the IDF will be determined by a site specific analysis. For low impact structures, the primary consideration is the protection against loss of the dam and its benefits in the event of failure, while for significant and high impact structures, adequate protection of life and property must be assured.

e. For dams classified as high impact, the IDF is defined as the flood event above which a breach of the dam does not increase hazard to downstream interests. The upper limit of the IDF for high impact structures is the Probable Maximum Flood (PMF), which is the flood which may be expected from the most severe combination of critical meteorological and hydrological conditions which are reasonably possible. While the PMF is the upper limit for the IDF, the IDF for high impact dams may be an event of smaller magnitude, depending upon an incremental hazard assessment. The incremental assessment is a routing of floods of increasingly larger magnitude through the structure and downstream channel reaches, comparing conditions with and without a dam failure, until a flood magnitude is reached for which the dam failure condition does not appreciably increase the hazard potential.

f. Dams classified as having significant impacts may or may not require a formal incremental hazard evaluation, depending upon the extent of existing and potential downstream development, the size of the reservoir, and the type and use of the dam. The upper limit of the IDF for significant impact structures is the PMF.

g. For dams with low impact classification, the incremental hazard evaluation is not required, and the IDF can be based upon factors related to loss of service of the dam, potential maintenance costs, etc., but with the 50-year frequency storm being the minimum design event.

h. The Water Resources Design and Development Section should be a partner in establishing the IDF, and designs should not proceed until agreement has been reached between the DOTD and the owner's engineer on the choice of the IDF. Establishing the IDF is the foundation for the entire design process, since the dam must be designed to safely pass and/or contain the IDF. A guideline for performing the incremental hazard evaluation necessary to establish the IDF is provided in the publication referred to in Subsection N.

i. How the IDF is to be safely passed by the dam structure and the stability of the dam against the long-term effects of hydrostatic forces is the subject of the balance of the design effort, including the general configuration of the dam; length, elevation, and composition of principal and emergency spillways; storage capacity above normal pool elevation; erosion protection; and stability design. The most practical way of assuring the integrity of the dam during an IDF is to provide a concrete spillway which is capable of carrying the peak flow of the storm. Principal spillways are normally sized to carry flows from all but the largest of storms, with emergency spillways, which are not normally armored, functioning only during major storm events. If the peak flow from the IDF can be contained within the principal and emergency spillways, the stability of the dam is not likely to be threatened by the erosive action of water flowing over the embankment. The designer may wish to balance the relative economy of providing spillway capacity versus storage capacity above normal pool stage. But, if design calculations indicate that the embankment will be overtopped by the IDF, provisions must be included in the design to prevent the embankment from failing under the erosive forces of the overtopping flows.

5. Geotechnical Design

a. It is essential to the stability of the structure that the material used in the impoundment structure, as well as the foundation and adjoining earth have the necessary structural properties to withstand the hydrostatic forces required by the design, that potential for destructive seepage is identified and appropriately dealt with, and that the

surfaces of the structure are adequately protected from surface erosion.

b. Field investigations shall be adequate to define the soils and ground water conditions with respect to stability and seepage control. Stability analysis should consider after-construction conditions, based on the undrained shear strength parameters determined by laboratory tests. Long-term steady seepage, partial pool, and rapid drawdown analyses should also be performed, using shear properties appropriate to the subject materials and minimum safety factors shown in the following Table:

Table 2. Factor of Safety for Stability Analysis	
Analysis Condition	**Factor of Safety**
Rapid Drawdown	1.25
Partial Pool	1.40
Steady Seepage	1.40
After Construction	1.30
Earthquake	1.15

6. Structural Design. Structural Designs are to be prepared in accordance with generally accepted structural engineering practices such as those of the American Concrete Institute, the American Institute of Steel Construction and the American Institute of Timber Construction. Components of the spillway or other appurtenant structures shall be designed to resist the most critical loading combination of dead loads plus live loads that may occur during its construction or design life. Some of the loads which must be considered in the design are: buoyancy forces, sliding forces, hydrostatic uplift forces, bearing forces, overturning forces, water drag forces, wing drag forces, gate-lifting and closing forces, soil and water pressure forces, impact forces, uniform and point live load forces, etc. The minimum factors of safety for buoyancy and sliding shall be 1.5 and 2.0, respectively. The overturning analysis must indicate that the resultant force falls within the center 1/3 of the base. The minimum factor of safety for pile design shall be 2.0.

H. Construction

1. It will be the owner's responsibility to ensure by the presence of professional construction supervision personnel that the structure is built in strict compliance with the approved designs and specifications. Adequate records shall be maintained to document that all materials and construction procedures meet or exceed those specified. The owner shall report on the construction to the DOTD. The work of construction, enlargement, alteration, repair or removal of a dam or reservoir for which approved application, designs, plans and specifications are required shall be under the responsible charge of a registered civil engineer. Upon completion of the work and prior to the impoundment of water, the engineer shall certify that all work has been done in compliance with the approved plans and specifications (See §2103.H).

2. During construction, periodic inspections may be made by representatives of the DOTD. The owner will be required to provide such works or tests as may be needed to disclose sufficient information to enable the DOTD to determine that conformity with approved plans and specifications is being maintained. Inspections made by the DOTD are "limited inspections" and do not relieve the owner or the owner's engineer from their responsibilities for conformance to accepted designs and procedures.

I. Maintenance and Operations

1. Once in service, the integrity of the impoundment structure must be sustained by regular maintenance, in accordance with the approved Operations and Maintenance document provided by the designer. The Operations and Maintenance Manual should contain forms and schedules for records and documentation of inspections, maintenance procedures, and repairs. The owner will be responsible for certifying, through properly documented records, to the DOTD that the required periodic inspections have been made, for correcting any deficiencies revealed during such inspections, and for maintaining records of all operations and maintenance activities, as well as of original construction and any subsequent modifications.

2. An Emergency Preparedness Plan is required for all dams and reservoirs. The plan shall comply with the guidelines of the current issue of Louisiana's *Emergency Action Plan Guidelines*, available from the DOTD's Director of Public Works and Flood Control. The Emergency Preparedness Plan will be a condition of the permit for the project, and it will be the owner's responsibility to implement the provisions of the plan in the event of emergency.

J. Inspections

1. The DOTD will periodically inspect every dam in the jurisdiction of the program. The purpose of the DOTD inspections is to ascertain whether the structure is being properly maintained in accordance with the approved Operations and Maintenance procedures. The DOTD inspections are " limited inspections " and do not relieve the owner of responsibility to perform and document periodic inspections. If an inspection by the DOTD reveals that a dam is unsafe or in danger of becoming unsafe, the DOTD, through the Director of Public Works and Flood Control, shall direct the owner to take whatever action is necessary to restore the dam to its design condition.

2. The owner has the primary responsibility for insuring the safe condition of the structure by regular maintenance and periodic inspection. The owner is required to immediately inform the Director of Public Works and Flood Control of any unusual circumstances or occurrences which may affect the condition or safety of the reservoir. Also, the Director will be notified prior to any planned draw downs of the reservoir.

K. Enforcement. If any dam or impoundment structure is determined to be unsafe, the Director of Public Works and Flood Control, pursuant to R.S. 38:21-28, shall direct any such repairs or remediations for a dam or impoundment structure as he deems necessary to insure that life and property are not unduly threatened by the impoundment. such remedial action may include:

1. direction that the water level behind the structure be lowered to a safe level; or

2. that the impoundment be completely drained until all necessary corrections to the structure have been made.

L. Existing Structures

1. All dams constructed or under construction prior to promulgation of these Rules will be reviewed to assess their disposition under the program regulations. Each dam is unique and must be judged on the basis of its own particular set of circumstances. Based on the circumstances of each individual case, a judgment will be made of what modifications or repairs are necessary to meet program standards. It is the intent of the program to eventually have every dam upgraded to meet program standards. The DOTD will be the sole judge of whether an existing deficiency creates an unacceptable risk to the general public. While it is not the intent of this program to lower the standards for existing dams, the DOTD recognizes that it is not practical to require all dam owners to immediately retrofit their structures to meet new minimum Inflow Design Flood standards.

2. An "Impoundment Permit" is required for existing dams and will be issued after reviewing all historical data (designs, plans, specifications, operation and maintenance records, etc.) and performing a technical inspection (or inspections) to adequately assess the safety of the dam. The owner shall provide all historical data, if available.

M. Emergency Preparedness Plan

1. An Emergency Preparedness Plan is required for all dams and reservoirs both existing and new construction. The plan will comply with the guidelines of the current issue of Louisiana's *Emergency Action Plan Guidelines*, available from the Director of Public Works and Flood Control, and shall be submitted as a necessary component of the Maintenance and Operating Procedures and as a condition of the permitting process. It is the owner's responsibility to assure that the provisions of the Emergency Action Plan are implemented in the event of an emergency situation.

2. A breach analysis is required to develop the emergency preparedness plan. The breach analysis will establish the magnitude of the inundated area (inundation map), peak flood elevations and arrival times of the peak flood elevations at critical locations. The worst case scenario breaching event will be somewhere between the "sunny day" breach and that event above which a breach of the dam does not increase hazard to downstream interests. If the dam owner prefers to perform only one breach analysis rather than performing incremental analyses to discover the worst case scenario breaching event, he may perform a breach analysis where the tail water is at the average annual elevation and the reservoir is at maximum design surcharge.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1234 (December 1996).

§2103. Figures and Forms

A. Structures that are required to have an approved permit under the State Dam Safety Program.

B. Structures that must be submitted to the Chief Engineer for review under the State Dam Safety Program.

C. Procedural Sequence

1) Applicant or his Engineer submits "Letter of Intent."

2) Applicant or his Engineer submits "Pre-Application for Construction of Dam."

3) Applicant publishes "Notice of Application" and a "Public Hearing(s)" is (are) held.

4) Applicant or his Engineer submits "Designs, Plans and Specifications" as follows and submits "Application for Construction of Dams."

a) "Impact (Hazard) Classification.

b) Determination of controlling design condition and associated storm runoff.

c) Setting of spillway and stilling basin widths and elevations, top of embankment elevation, and normal pool stage.

d) Plans, Specifications, Designs and other Submittals.

5) The DOTD issues "Approval or Denial of Application"; Approval is an "Approval for Construction."

6) Construction begins; Applicant or his Engineer performs "Construction Inspections."

7) If "Deficiencies" are found by the DOTD, Applicant or Applicant's Engineer; then the Applicant or his Engineer shall correct the deficiencies.

8) Supervision of Construction by the Owner.

9) Applicant or his Engineer submits "Notice of Completion" and "As-Built Drawings" and revised "Application for construction of Dam."

10) The DOTD issues "Certificate of Completion/Impoundment Permit."

11) Applicant or his Engineer submits "Maintenance and Operation Procedures" for the DOTD's approval.

12) Applicant or his Engineer submits "Emergency Preparedness Plan" for the DOTD's approval.

D. Pond Data Sheet

Date:

Dam Safety Administrator
Louisiana DOTD
P. O. Box94245, Capitol Station
Baton Rouge, Louisiana 70804-9245

RE: Pond Construction

I am aware that the design, construction and operation of all dams within Louisiana is regulated by the Rules and Regulations for Dam Safety Program as developed by the State of Louisiana, Department of Transportation and Development. I am also aware of the liability that is associated with owning a dam.

Since I am receiving design and construction assistance from the National Resources Conservation Service, the dam described below is excluded from the approval process outlined in the Dam Safety Regulations. However, if for some reason (such as a land use change) the dam no longer comes within the criteria of the National Resources Conservation Service National Handbook for Conservation Practices-Standard 378, I agree to modify the structure if necessary to comply with the requirements of the Dam Safety Regulations. I also agree to allow access for inspection of this structure.

Sincerely,

OWNER

DAM LOCATION:
DESCRIPTION:

E. Notice of Application

Pursuant to the Rules and Regulations of the Louisiana Dam Safety Program as established by R.S. 38:21-28 interested parties are hereby notified that a "Letter of Intent" and a "Pre-Application for Construction of Dam" have been received by the DOTD Public Works and Flood Control Directorate to construct the proposed Dam and Reservoir Pre-Application Number PA located in Section , Township , Range , Parish.

Applicant:
(Name)
(Address)
(Phone)

Purpose and Brief Description of Dam:

All interested parties are hereby notified that a public hearing on the application will be held at p.m. on at.

Any interested party shall have the right to request a public hearing on the application. Requests for additional public hearings must be in writing and must be submitted no later than the close of the public hearing on . Letters must state, with particularity, the reasons for holding a public hearing, applicant's name and pre-application number. On receiving a written request for an additional hearing(s) within the time limits set forth in this notice, the DOTD Public Works and Flood Control Directorate shall set a date, time and place for conducting a hearing on the application. During the hearings, any interested party shall have the right to protest the application and to appear and present evidence and testimony in support of such protest.

F. Minimum Required Submittals

1) All structural, geotechnical, hydrologic and hydraulic design calculations. An engineer's report shall also be submitted which summarizes the design analyses and shall include, but is not limited to, the following:

a) Formulas, methods and basic data assumptions used in the designs.

b) List of all pertinent design codes.

c) Summary tables which list design load cases, computed design factors of safety and required factors of safety as specified in these rules and regulations or required by pertinent design codes.

d) All other information which aided in evaluating the design, supported assumptions and conclusions, and will facilitate an independent review.

2) Plans with sufficient details to construct all features of the dam in accordance with the design intent. Also, the plans shall include details to construct a permanent reference mark (bench mark) near, but separate from, the project. The exact location and elevation above mean sea level must be noted on the "as-built" plans.

3) Specifications with sufficient details to construct all features of the dam in accordance with the design intent. The specifications shall also provide that the plans and specifications may not be changed without prior written approval by the DOTD.

4) Document(s) to show proof of ownership.

5) An inspection plan specific to the construction activity. The inspection plan is to detect deficiencies or situations that may result in a threat to life and property.

6) An emergency action plan specific to the construction activity. The inspection plan in item 5 is part of the emergency action plan under this item.

7) If the applicant has an agreement or contract with another entity who will be responsible for the operation and maintenance of the dam, the applicant must provide copies of the agreement or contract document(s).

8) If the applicant is constructing the dam for the specific purpose of transferring ownership to a homeowners' association, a landowners' association, or any other entity, the applicant must provide a document which clearly states his intent, i.e., a dam which is constructed for a subdivision development where ownership will be transferred to a homeowners' association.

9) All other "Permits" required to construct the dam and "Letters of No Objection" which were obtained from various regulatory entities.

10) "As-Built" plans.

11) "Operation and Maintenance Manual".

12) "Emergency Preparedness Plan".

NOTE: The applicant should submit 2 copies of all preliminary submittals. The applicant must submit 5 copies of all final submittals.

G. Letter of Intent

Purpose: To notify the Louisiana Dam Safety Program of the applicant's intent to construct, enlarge, alter, repair or remove a dam within the state.

Address To: Louisiana Dam Safety Program
Louisiana Department of Transportation and Development
Public Works and Flood Control Directorate
Box 94245
Baton Rouge, LA 70804-9245

Contents:
1) Name of proposed or existing dam
2) Purpose of dam:
3) Owner's:
Name:
Address:
Telephone:
4) Location of dam (section, township, range, parish).
5) Brief description of proposed dam construction, enlargement, alteration, repair or removal.
*6) Height of Dam (height in feet from top of dam to lowest point at downstream toe of dam).
*7) Reservoir Capacity (volume in acre-feet with water at top of dam).

NOTE: *Items 6 and 7 can be approximated at this time.

H. Letter of "Notice of Completion and As-built Drawings"

Purpose: To notify the Louisiana Dam Safety Program that the construction of the subject project is complete and to certify that said construction was done in accordance with the approved designs, plans, drawings and specifications.

From: Applicant's Consulting Engineering Firm (letter must be signed and sealed by a Registered Professional Civil Engineer licensed in the State of Louisiana).

Address To: Louisiana Dam Safety Program
Louisiana Department of Transportation and Development
Public Works and Flood Control Directorate
Box 94245
Baton Rouge, LA 70804-9245

NOTE: As-Built Drawings must be received by the DOTD Public Works and Flood Control Directorate within 30 days after completion.

I. Letters of No Objection and Other Permits. The applicant must forward copies of the pre-application to the appropriate state, federal and local agencies to obtain letters of no objection and/or permits as required by these agencies. Copies of the letters of no objection and permits must be submitted to the Louisiana Dam Safety Program as part of the applicant's application under this program.

J. Minimum Hydrologic and Hydraulic Submittals to Establish Impact Classification and Inflow Design Flood (IDF). Since the required submittals may vary for each dam, it is recommended that applicant or his engineer obtain copies of references number 1 and 2 of the Dam Safety Rules and Regulations. After reviewing these documents, the applicant or his engineer is advised to contact the Dam Safety Program of the Water Resources Design and Development Section of the DOTD for further guidance.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1234 (December 1996).

Chapter 7. Dam Safety Program

Subchapter A. Dam Safety

*Editor's Note: The name of the agency, The Public Works and Flood Control Directorate of the Department of Transportation and Development (DOTD), has changed to The Public Works and Hurricane Flood Protection Division of the Louisiana Department of Transportation and Development.

§701. Introduction

A. The *Public Works and Flood Control Directorate of the Department of Transportation and Development (DOTD) serves as the Water Resources agency for the state of Louisiana, providing engineering and technical support for the orderly planning and development of programs and projects related to flood control, drainage, irrigation, water diversions, reservoirs, navigation, port development, hurricane protection, coastal engineering, and management and development of water resources.

B. R.S. 38:21-28 legislation provides for a Dam Safety and Regulatory Program. The *Public Works and Flood Control Directorate is charged with the responsibility for administering the program. The program is operated by the DOTD's Water Resources Design and Development Section, with administrative and enforcement authority vested in the Director of the Public Works and *Flood Control Directorate.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1234 (December 1985), repromulgated by the Department of Transportation and Development, Office of Public Works, LR 31:942 (April 2005).

§703. Purpose

A. The purpose of R.S. 38:21-28 is to recognize the inherent dangers posed by impoundments of significant volumes of water, and to require that owners of structures which impound water (or other liquids) assume the responsibility for that danger by ensuring that such structures are designed, constructed, and maintained so as to minimize the risk to life and property. Regardless of the circumstances of failure, the owner is ultimately responsible for loss of life and property damages that may occur from the failure of his dam. *The Department of Transportation and Development, Public Works and Flood Control Directorate, is charged with the responsibility for developing and enforcing a regulatory program to ensure that public safety and welfare is not compromised by the presence of dams or other impoundment facilities. The Louisiana Dam Safety Program defines the minimum standards for the design, construction, operation, and maintenance of dams in the state of Louisiana, and the DOTD has the responsibility and the authority to enforce the standards of the program. This rule documents the minimum standards for design, construction, operation and maintenance of dams and impoundment structures and the policies for the enforcement of those standards.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1234 (December 1985), repromulgated by the Department of Transportation and Development, Office of Public Works, LR 31:942 (April 2005).

§705. Glossary

Abutments—those portions of the valley sides which underlie and support the dam structure, and are usually also considered to include the valley sides immediately upstream and downstream from the dam.

Auxiliary or *Emergency Spillway*—a secondary spillway designed to operate only during unusually large storm events. Louisiana's Dam Safety Program defines "unusually large storm events" as being equal to the 100 year storm event or larger.

Baffle Blocks—blocks constructed in a stilling basin to dissipate the energy of fast flowing water.

Berm—a horizontal step in a sloping profile. The berm is usually constructed with a slight slope for drainage purposes. The berm is often referred to as a seepage or stability berm.

Blanket Drain—a horizontal pervious zone located downstream of the impervious core. This zone is often referred to as a sand blanket.

Breach—an eroded opening through a dam that drains the reservoir. A controlled breach is an intentionally constructed opening. An uncontrolled breach is an unintentional opening that allows uncontrolled discharge from the reservoir.

Chimney Drain—a vertical pervious zone located just downstream of the impervious core. The chimney drain is usually constructed with a sand material.

Cofferdam—a temporary structure enclosing all or part of the construction area so that the construction can proceed in the dry.

Conduit—a closed channel to convey discharges through or under a dam. The conduit can be a reinforced concrete pipe, a corrugated metal pipe or a single or multi-barrel reinforced concrete box culvert.

Crest Length of Dam—the length of the top of dam. This length includes the spillway(s) and other appurtenant structures. The crest length of dam is basically the length from where the top of dam terminates on one abutment to a similar point on the other abutment.

Cutoff Trench—an impervious barrier built into the foundation to reduce seepage under the dam. A cutoff wall or slurry wall could be used as a seepage barrier. The slurry wall is relatively thinner in the horizontal direction when compared to a clay core cutoff trench.

Dam—any artificial barrier, including appurtenant works, which does or will impound or divert water or any other liquid substance.

Downstream Slope—the inclined surface of an embankment dam that faces away from the reservoir.

Drawdown Structure—a low-level outlet which can be used to lower the reservoir below normal pool stage. This may be necessary for lake management purposes, routine repairs or dam safety purposes.

Earthfill Dam—a dam constructed predominantly of fine-grained material. Earthfill dams are also known as rolled fill dams where material is placed in layers and compacted by using rollers or rolling equipment.

End Sill—the area at the upstream and downstream end of the stilling basin base slab.

Foundation of Dam—the natural material on which the dam is placed.

Heel of Dam—the junction of the upstream slope with the foundation. The heel of the dam is often referred to as the upstream toe.

Impervious Core—a zone of low permeability material. This zone is the water or seepage barrier and is often referred to as the clay core.

Intake Structure—the structure placed at the beginning of an outlet works waterway. The intake structure establishes the ultimate drawdown level of the reservoir by the position of its opening(s) to the outlet works. Intake structures may be vertical or inclined towers (drop inlets).

Maximum Cross Section of Dam—cross section of a dam at the point where the height of the dam is at it's maximum.

Maximum Storage Capacity—the capacity at maximum storage is the volume in the reservoir in acre-feet when the level in the reservoir is at top of dam elevation.

Non-Overflow Wall—a wall which is usually constructed parallel to the spillway crest at an elevation equal to the top of dam elevation. This wall is not designed to be overtopped and are often referred to as a closed dam section.

Normal Pool Stage—the water level at the dam to which water may rise under normal operating conditions and for uncontrolled spillways is defined as the lowest crest elevation of the principal spillway. This does not include flood surcharge.

Outlet Gate—a gate on the drawdown structure or spillway which is used to control the outflow of water.

Piping—the progressive internal erosion of an embankment, foundation, or abutment material. The erosion (piping) begins on the downstream side and progresses upstream.

Primary or *Principal Spillway*—the first used spillway during flood flows.

Probable Maximum Flood (PMF)—the flood that may be expected from the most severe combination of critical meteorologic conditions that are possible in the region.

Retaining/Training Walls—walls which are usually constructed perpendicular to the spillway crest. Retaining walls are walls which support an overturning load. Training walls are walls which confine or guide the flow of water. In many instances, these walls serve both purposes and can be referred to as either a retaining or training wall.

Riprap—a layer of large uncoursed stones, broken rock or precast blocks placed in a random fashion on the upstream slope of the dam and stilling basin outlets. Riprap is a flexible type of slope protection which will deform if material is displaced from beneath.

Riser—a type of drop inlet spillway with a vertical section of metal or concrete pipe that allows the reservoir to rise to a predetermined level before water flows into the pipe.

Slope Protection—protection against wave action or erosion. The two most common types of slope protection, are riprap and soil cement.

Sluice—a low-level opening for releasing water from a dam.

Soil Cement—a well compacted mixture of soil, portland cement and water that produces a hard pavement. Soil cement is usually placed in horizontal layers. Soil cement is a rigid type of slope protection which attempts to span voids.

Spillway Crest—the overflow section or top of weir section of the spillway.

Stilling Basin—a basin constructed to dissipate the energy of fast flowing water. The stilling basin area is located just downstream of the spillway crest between the training/retaining walls.

Structural Height—the distance between the lowest point in the excavated foundation and the top of the dam.

Surcharge/Flood Surcharge—the volume or space between normal pool and the maximum design water level.

Tailwater—the level of water immediately downstream of the dam.

Toe of Dam—the junction of the downstream slope with the foundation. The toe of the dam is often referred to as the downstream toe.

Top of Dam/Crown—the uppermost surface of the dam. The top of dam can also be referred to as the crest of the dam. When the term "crest" is used, it must be specified that it is the "crest of the dam" and not the "crest of the spillway."

Uncontrolled or *Ungated Spillways*—spillways where the flows over the spillway crest are controlled only by the elevation of the spillway crest. This type of spillway is often referred to as a fixed crest spillway. *Normal Pool Stage* for uncontrolled spillways is defined as the lowest crest elevation of the principal spillway.

Upstream Slope—the inclined surface of an embankment dam that is in contact with the reservoir.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1234 (December 1985), repromulgated by the Department of Transportation and Development, Office of Public Works, LR 31:942 (April 2005).

§707. Applicability

A. The regulations of this program will govern the construction, enlargement, alteration or repair, maintenance and operation of all dams as defined by R.S. 38:21-28. The terms *dam* and *impoundment structure* are used interchangeably and shall mean the embankment, spillway(s), outlet works and other attendant parts. Included are all artificial barriers together with all appurtenant works which impound or divert water or any other liquid and which are:

1. 25 feet or more in height and have an impounding capacity at maximum storage greater than 15 acre-feet, (See §729, Appendix 1); or

2. have an impounding capacity at maximum storage of 50 acre-feet or more and are greater than 6 feet in height (See §729, Appendix 1).

B. All barriers which are 6 feet or more in height with maximum storage capacities of 15 acre-feet or more must be submitted to the DOTD for review (See §731, Appendix 2). The height of a dam is measured from the natural bed of the stream or watercourse at the downstream toe of the barrier, or if it is not across a stream or watercourse, the height from the lowest elevation of the outside limit of the barrier, to the top of the dam.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1236 (December 1985), repromulgated by the Department of Transportation and Development, Office of Public Works, LR 31:942 (April 2005).

§709. Permitting

A. Application for Permit. Written approval for construction from the DOTD will be required prior to constructing any new impoundment structure or commencing any structural modifications to existing impoundment structures. Permit forms may be obtained from the Director, *Public Works and Flood Control Directorate, Louisiana Department of Transportation and Development, Box 94245, Baton Rouge, LA, 70804-9245. The permitting process is intended to ensure that new structures and modifications to existing structures are designed and constructed in accordance with the requirements documented herein. (See §733, Appendix 3.)

B. National Resources Conservation Service (NRCS), formally called Soil Conservation Service (SCS). The approval process may be abbreviated if dams meet the requirements of "Pond Standard 378" of the National Resources Conservation Service *National Handbook for Conservation Practices* and the National Resources Conservation Service's engineering staff provides the design, layout, and construction inspection. In this case, the National Resources Conservation Service will certify that the dam design and construction meets the requirements of "Pond Standard 378" and they will provide the DOTD with the Pond Data Sheet, a map showing the location of the pond, and a letter signed by the owner of the dam (See §735, Appendix 4). The National Resources Conservation Service will agree to periodically inspect the structure to ensure that "Pond Standard 378" is being maintained, and to inform the DOTD if the structure ever falls below "Pond Standard 378."

C. Public Hearings. After an application has been filed and accepted, the public in the affected locale will be notified by publication in the local news publication. The Director of Public Works and Flood Control will prepare a notice, assigning a date and place for a public hearing of the application. The notice will contain information describing the application and the name and address of the applicant (See §737, Appendix 5). It will be the applicant's responsibility to have the notice published once a week for two consecutive weeks in the official journal of the parish in which the project will be constructed, and shall provide notarized proof of publication on or before the hearing date. The applicant will bear the cost of the publication. The DOTD will conduct the public hearing, and the applicant will be required to attend to describe the nature and purpose of the proposed project and to answer questions.

D. Issuance of a Permit. An "Impoundment Permit/Certificate of Completion" shall be issued for all dams, both existing and new construction. The "Impoundment Permit/Certificate of Completion" is not transferable. The owner of a dam must notify the DOTD 30 days prior to transferring ownership of the dam, and must return the "Impoundment Permit/Certificate of Completion" to the DOTD.

E. Failure to Obtain Approval. If, prior to beginning construction, the owner fails to obtain approval, the owner will be cited and fined under the statutory authority of R.S. 38:28. Also, the lake may be ordered to be drained until all approvals have been obtained.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1236 (December 1985), repromulgated by the Department of Transportation and Development, Office of Public Works, LR 31:942 (April 2005).

§711. Submittals

A. All designs for work to be permitted under the program will be submitted for review and approval with all necessary supportive documentation (See §739, Appendix 6). Normally it is expected that an owner or prospective owner will establish contact with the DOTD to apply for a permit to construct or modify a dam. An example of a letter notifying the DOTD of intent to construct or modify a dam is provided (See §741, Appendix 7). In some cases, however, structures are built and water is impounded without the knowledge or approval of the DOTD. When such structures are discovered, the owners will be contacted by the DOTD and required to furnish documentation that their structure meets the safety requirements of the program. In either case, the applicant shall be guided by the Water Resources Design and Development Section throughout the review and approval process. The documentation required shall be formal engineering designs and calculations, supported by

sufficient field information, and certified by a professional civil engineer registered to practice in Louisiana. Because each step in the design of a dam is dependant upon the quality of the design judgments made in the previous steps, the applicant is advised to coordinate each of the design stages identified in the next Section with the DOTD review team prior to proceeding to the next step.

B. After general designs have been approved, the applicant may proceed with plans and specifications, which will also require approval before construction can begin. Plans and specifications will be of professional engineering detail and quality and will include all information and directions necessary to construct the dam in accordance with the design intent.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1236 (December 1985), repromulgated by the Department of Transportation and Development, Office of Public Works, LR 31:942 (April 2005).

§713. Design

A. The proper design of a dam involves a complex combination of engineering applications. It is not within the scope or intent of this document, nor will it be the practice of the staff of the DOTD, to instruct in the detailed procedures for the design of a dam. All dams and impoundment structures to be permitted under this program will be designed by a professional civil engineer(s), registered by the Louisiana State Board of Registration for Professional Engineers and Land Surveyors. The registered civil engineer will certify the designs and plans by professional seal. Designs must conform to nationally recognized standards, further explained in the following Paragraphs and in the Appendices. The completed design package will state the intended design life of the structure, and will include the operations and maintenance procedures necessary to ensure that the structure will function as designed for its stated design life.

B. Failure of an impoundment structure and the instantaneous release of large volumes of water is referred to as a dam breach. It is the primary risk associated with dams, and is the fundamental reason for the state to assume regulatory authority over dams through the Louisiana Dam Safety Program. Breaching may occur during fair weather due to the cumulative effects of erosion or seepage, or it may occur as a result of stresses caused by excess water produced during a storm event. The hydraulic and hydrologic (H and H) design will determine which of the two scenarios poses the greater hazard, the volume of water which is likely to be released, and the rate of flow.

C. It is the H and H design which determines the volumes and flow rates with which the impoundment structure(s) must contend. The geotechnical and structural designs must ensure that the impoundment structure(s) can safely accommodate the hydraulic forces imposed by the conditions predicted by the H and H design. Following are the sequential steps which are necessary in any dam/impoundment structure design, and each step must be documented with design calculations and all supporting data, certified by a Registered Professional Civil Engineer:

1. Hydrology and Hydraulics (H and H) Design

a. Impact (Hazard) Classification.

b. Determination of controlling design condition and associated storm runoff.

c. Setting of spillway and stilling basin widths and elevations, top of embankment elevation, and normal pool stage.

2. Structural and Geotechnical Design of Embankment, Spillways, and Drawdown Structures

3. Development and Documentation of Operations and Maintenance Procedures

> NOTE: For the purpose of the Dam Safety Program, the *Emergency Spillway* shall be defined as being overtopped by the 100-year storm or greater and the *Principal Spillway* shall be defined as being overtopped by a storm less than the 100-year storm.

D. Hydrology and Hydraulics (H and H) Design

1. Before the structural design of the dam can begin, the requirements of hydraulic capacity must be determined. The height of the dam, the amount of freeboard above normal pool elevation, the size and capacity of the principle and emergency spillways, must all be designed to balance the hydrological and hydraulic properties of the location of the reservoir. A properly designed drawdown structure, capable of reducing the stage of the reservoir at a suitable rate in the event of emergency, must also be designed to meet the capacity requirements of the site.

2. H and H design begins with the Impact Classification (also referred to as Hazard Classification in some texts) of the dam. The Impact Classification is determined by an evaluation of the probable maximum impacts of a dam breach. Low impact structures are those for which, because of size and/or location, little or no significant damage to life or property is likely to result from a failure of the structure. Significant impact structures are those which could cause appreciable damage to property or could pose possible threat to human life in the event of failure. High impact structures are those for which failure would cause excessive property damage or make loss of human life likely.

> NOTE: The inflow design flood (IDF) is determined by the various Hydrograph Methods after the precipitation amount is developed. The major source of precipitation data is the National Weather Service (NWS). The DOTD has final authority for approval of the method to be utilized to determine the IDF.

Table 1. Impact Classification and Inflow Design Flood

Impact Category	Potential Loss of Life	Potential Economic Loss	Minimum Inflow Design (IDF)
Low	Not Likely	Minimal	50-Yr. Freq.
Significant	Possible	Appreciable	100-Yr. Freq.
High	Likely	Excessive	1/2 PMF

3. Further guidance in assessing the potential hazards and associated impact classification for dams may be found in the publication referred to in §727. It is the responsibility of the owner/applicant to establish impact classification, and all dams will be considered to be of High Impact potential until demonstrated to be otherwise by a documented analysis provided by the applicant. The proposed impact classification must be supported by sufficient analysis and documentation, and the DOTD will have final authority for assigning Impact Classification.

4. Having established the Impact Classification for the structure, the next step is to establish the magnitude of the meteorological event on which the entire design is to be based. Dams must be designed to be able to safely withstand the passage of a flood of design magnitude. The Inflow Design Flood (IDF) is the largest storm event to be considered in the design of the structure, and the magnitude of the storm event for which the IDF is computed is related to the Impact Classification. The values shown for IDF in Table I are minimums, and the storm event to be used as the IDF will be determined by a site specific analysis. For low impact structures, the primary consideration is the protection against loss of the dam and its benefits in the event of failure, while for significant and high impact structures, adequate protection of life and property must be assured.

5. For dams classified as high impact, the IDF is defined as the flood event above which a breach of the dam does not increase hazard to downstream interests. The upper limit of the IDF for high impact structures is the Probable Maximum Flood (PMF), which is the flood which may be expected from the most severe combination of critical meteorological and hydrological conditions which are reasonably possible. While the PMF is the upper limit for the IDF, the IDF for high impact dams may be an event of smaller magnitude, depending upon an incremental hazard assessment. The incremental assessment is a routing of floods of increasingly larger magnitude through the structure and downstream channel reaches, comparing conditions with and without a dam failure, until a flood magnitude is reached for which the dam failure condition does not appreciably increase the hazard potential.

6. Dams classified as having significant impacts may or may not require a formal incremental hazard evaluation, depending upon the extent of existing and potential downstream development, the size of the reservoir, and the type and use of the dam. The upper limit of the IDF for significant impact structures is the PMF.

7. For dams with low impact classification, the incremental hazard evaluation is not required, and the IDF can be based upon factors related to loss of service of the dam, potential maintenance costs, etc., but with the 50-year frequency storm being the minimum design event.

8. The Water Resources Design and Development Section should be a partner in establishing the IDF, and designs should not proceed until agreement has been reached between the DOTD and the owner's engineer on the choice of the IDF. Establishing the IDF is the foundation for the entire design process, since the dam must be designed to safely pass and/or contain the IDF. A guideline for performing the incremental hazard evaluation necessary to establish the IDF is provided in the publication referred to in Subsection N.

9. How the IDF is to be safely passed by the dam structure and the stability of the dam against the long-term effects of hydrostatic forces is the subject of the balance of the design effort, including the general configuration of the dam; length, elevation, and composition of principal and emergency spillways; storage capacity above normal pool elevation; erosion protection; and stability design. The most practical way of assuring the integrity of the dam during an IDF is to provide a concrete spillway which is capable of carrying the peak flow of the storm. Principal spillways are normally sized to carry flows from all but the largest of storms, with emergency spillways, which are not normally armored, functioning only during major storm events. If the peak flow from the IDF can be contained within the principal and emergency spillways, the stability of the dam is not likely to be threatened by the erosive action of water flowing over the embankment. The designer may wish to balance the relative economy of providing spillway capacity versus storage capacity above normal pool stage. But, if design calculations indicate that the embankment will be overtopped by the IDF, provisions must be included in the design to prevent the embankment from failing under the erosive forces of the overtopping flows.

E. Geotechnical Design

1. It is essential to the stability of the structure that the material used in the impoundment structure, as well as the foundation and adjoining earth have the necessary structural properties to withstand the hydrostatic forces required by the design, that potential for destructive seepage is identified and appropriately dealt with, and that the surfaces of the structure are adequately protected from surface erosion.

2. Field investigations shall be adequate to define the soils and ground water conditions with respect to stability and seepage control. Stability analysis should consider after-construction conditions, based on the undrained shear strength parameters determined by laboratory tests. Long-term steady seepage, partial pool, and rapid drawdown analyses should also be performed, using shear properties appropriate to the subject materials and minimum safety factors shown in the following Table.

Table 2. Factor of Safety for Stability Analysis

Analysis Condition	Factor of Safety
Rapid Drawdown	1.25
Partial Pool	1.40
Steady Seepage	1.40
After Construction	1.30
Earthquake	1.15

6. Structural Design. Structural Designs are to be prepared in accordance with generally accepted structural engineering practices such as those of the American Concrete Institute, the American Institute of Steel Construction and the American Institute of Timber

Construction. Components of the spillway or other appurtenant structures shall be designed to resist the most critical loading combination of dead loads plus live loads that may occur during its construction or design life. Some of the loads which must be considered in the design are: buoyancy forces, sliding forces, hydrostatic uplift forces, bearing forces, overturning forces, water drag forces, wing drag forces, gate-lifting and closing forces, soil and water pressure forces, impact forces, uniform and point live load forces, etc. The minimum factors of safety for buoyancy and sliding shall be 1.5 and 2.0, respectively. The overturning analysis must indicate that the resultant force falls within the center 1/3 of the base. The minimum factor of safety for pile design shall be 2.0.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1237 (December 1985), repromulgated by the Department of Transportation and Development, Office of Public Works, LR 31:942 (April 2005).

§715. Construction

A. It will be the owner's responsibility to ensure by the presence of professional construction supervision personnel that the structure is built in strict compliance with the approved designs and specifications. Adequate records shall be maintained to document that all materials and construction procedures meet or exceed those specified. The owner shall report on the construction to the DOTD. The work of construction, enlargement, alteration, repair or removal of a dam or reservoir for which approved application, designs, plans and specifications are required shall be under the responsible charge of a registered civil engineer. Upon completion of the work and prior to the impoundment of water, the engineer shall certify that all work has been done in compliance with the approved plans and specifications (See §743, Appendix 8).

B. During construction, periodic inspections may be made by representatives of the DOTD. The owner will be required to provide such works or tests as may be needed to disclose sufficient information to enable the DOTD to determine that conformity with approved plans and specifications is being maintained. Inspections made by the DOTD are "limited inspections" and do not relieve the owner or the owner's engineer from their responsibilities for conformance to accepted designs and procedures.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1239 (December 1985), repromulgated by the Department of Transportation and Development, Office of Public Works, LR 31:942 (April 2005).

§717. Maintenance and Operations

A. Once in service, the integrity of the impoundment structure must be sustained by regular maintenance, in accordance with the approved operations and maintenance document provided by the designer. The Operations and Maintenance Manual should contain forms and schedules for records and documentation of inspections, maintenance procedures, and repairs. The owner will be responsible for certifying, through properly documented records, to the DOTD that the required periodic inspections have been made, for correcting any deficiencies revealed during such inspections, and for maintaining records of all operations and maintenance activities, as well as of original construction and any subsequent modifications.

B. An Emergency Preparedness Plan is required for all dams and reservoirs. The plan shall comply with the guidelines of the current issue of Louisiana's *Emergency Action Plan Guidelines*, available from the DOTD's Director of Public Works and Flood Control. The Emergency Preparedness Plan will be a condition of the permit for the project, and it will be the owner's responsibility to implement the provisions of the plan in the event of emergency.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1239 (December 1985), repromulgated by the Department of Transportation and Development, Office of Public Works, LR 31:942 (April 2005).

§719. Inspections

A. The DOTD will periodically inspect every dam in the jurisdiction of the program. The purpose of the DOTD inspections is to ascertain whether the structure is being properly maintained in accordance with the approved operations and maintenance procedures. The DOTD inspections are "limited inspections" and do not relieve the owner of responsibility to perform and document periodic inspections. If an inspection by the DOTD reveals that a dam is unsafe or in danger of becoming unsafe, the DOTD, through the Director of Public Works and Flood Control, shall direct the owner to take whatever action is necessary to restore the dam to its design condition.

B. The owner has the primary responsibility for insuring the safe condition of the structure by regular maintenance and periodic inspection. The owner is required to immediately inform the Director of Public Works and Flood Control of any unusual circumstances or occurrences which may affect the condition or safety of the reservoir. Also, the director will be notified prior to any planned draw downs of the reservoir.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1239 (December 1985), repromulgated by the Department of Transportation and Development, Office of Public Works, LR 31:942 (April 2005).

§721. Enforcement

A. If any dam or impoundment structure is determined to be unsafe, the Director of Public Works and Flood Control, pursuant to R.S. 38:21-28, shall direct any such repairs or remediations for a dam or impoundment structure as he

deems necessary to insure that life and property are not unduly threatened by the impoundment. such remedial action may include:

1. direction that the water level behind the structure be lowered to a safe level; or

2. that the impoundment be completely drained until all necessary corrections to the structure have been made.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1239 (December 1985), repromulgated by the Department of Transportation and Development, Office of Public Works, LR 31:942 (April 2005).

§723. Existing Structures

A. All dams constructed or under construction prior to promulgation of these Rules will be reviewed to assess their disposition under the program regulations. Each dam is unique and must be judged on the basis of its own particular set of circumstances. Based on the circumstances of each individual case, a judgment will be made of what modifications or repairs are necessary to meet program standards. It is the intent of the program to eventually have every dam upgraded to meet program standards. The DOTD will be the sole judge of whether an existing deficiency creates an unacceptable risk to the general public. While it is not the intent of this program to lower the standards for existing dams, the DOTD recognizes that it is not practical to require all dam owners to immediately retrofit their structures to meet new minimum Inflow Design Flood standards.

B. An "Impoundment Permit" is required for existing dams and will be issued after reviewing all historical data (designs, plans, specifications, operation and maintenance records, etc.) and performing a technical inspection (or inspections) to adequately assess the safety of the dam. The owner shall provide all historical data, if available.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1239 (December 1985), repromulgated by the Department of Transportation and Development, Office of Public Works, LR 31:942 (April 2005).

§725. Emergency Preparedness Plan

A. An Emergency Preparedness Plan is required for all dams and reservoirs both existing and new construction. The plan will comply with the guidelines of the current issue of Louisiana's *Emergency Action Plan Guidelines*, available from the Director of Public Works and Flood Control, and shall be submitted as a necessary component of the maintenance and operating procedures and as a condition of the permitting process. It is the owner's responsibility to assure that the provisions of the Emergency Action Plan are implemented in the event of an emergency situation.

B. A breach analysis is required to develop the emergency preparedness plan. The breach analysis will establish the magnitude of the inundated area (inundation map), peak flood elevations and arrival times of the peak flood elevations at critical locations. The worst case scenario breaching event will be somewhere between the "sunny day" breach and that event above which a breach of the dam does not increase hazard to downstream interests. If the dam owner prefers to perform only one breach analysis rather than performing incremental analyses to discover the worst case scenario breaching event, he may perform a breach analysis where the tail water is at the average annual elevation and the reservoir is at maximum design surcharge.

AUTHORITY NOTE: Promulgated in accordance with R.S. 38:24.

HISTORICAL NOTE: Promulgated by the Department of Transportation and Development, Office of Public Works, LR 22:1239 (December 1985), repromulgated by the Department of Transportation and Development, Office of Public Works, LR 31:942 (April 2005).

37-B §1111. DEFINITIONS

As used in this chapter, unless the context otherwise indicates, the following terms have the following meanings. [2001, c. 460, §3 (NEW).]

1. **Dam.** "Dam" means any artificial barrier, including appurtenant works, the site on which it is located and appurtenant rights of flowage and access, that impounds or diverts water, and that:

A. Is 25 feet or more in height from the natural bed of the watercourse measured at the downstream toe of the barrier or from the lowest elevation of the outside limit of the barrier to the maximum water storage elevation and impounds at least 15 acre-feet of water; or [2001, c. 460, §3 (NEW).]

B. Is 6 feet or more in height from the natural bed of the watercourse measured at the downstream toe of the barrier or from the lowest elevation of the outside limit of the barrier to the maximum water storage elevation and has an impounding capacity at maximum water storage elevation of 50 acre-feet or more. [2001, c. 460, §3 (NEW).]

[2001, c. 460, §3 (NEW) .]

2. **Commissioner.** "Commissioner" means the Commissioner of Defense, Veterans and Emergency Management.

[2001, c. 460, §3 (NEW) .]

3. **Emergency.** "Emergency" means breaches and all conditions leading to or causing a breach, overtopping or any other condition in a dam and its appurtenant structures that may be construed as unsafe or threatening to life and property.

[2001, c. 460, §3 (NEW) .]

4. **Emergency situation.** "Emergency situation" means a situation determined by the commissioner, after consultation with other state and federal agencies if time permits, to present a potential but real and impending danger to life, limb or property because of flooding or potential and imminent flooding and includes a situation that the Governor declares to be an emergency pursuant to section 742.

[2001, c. 460, §3 (NEW) .]

5. **Emergency action plan.** "Emergency action plan" means a set of written instructions or guidelines for use by public officials that recommends actions that, when implemented, will minimize the effects of a dam failure on people and property.

[2001, c. 460, §3 (NEW) .]

6. **Hazard potential.** "Hazard potential" means the possible adverse incremental consequences that result from the release of water or stored contents due to failure of the dam or misoperation of the dam or appurtenances. The hazard potential classification of a dam does not reflect in any way on the current condition of the dam and its appurtenant structures. The classifications are as follows:

A. High hazard potential dam. "High hazard potential dam" means a dam assigned the high hazard potential classification where failure or misoperation will probably cause loss of human life; [2001, c. 460, §3 (NEW).]

B. Low hazard potential dam. "Low hazard potential dam" means a dam assigned the low hazard potential classification where failure or misoperation results in no probable loss of human life and low economic and environmental losses. Losses are principally limited to the owner's property; and [2001, c. 460, §3 (NEW).]

C. Significant hazard potential dam. "Significant hazard potential dam" means a dam assigned the significant hazard potential classification where failure or misoperation results in no probable loss of human life but can cause major economic loss, environmental damage or disruption of lifeline facilities or affect other concerns. Significant hazard potential dams are often located in predominantly rural or agricultural areas but could be located in areas with population and significant infrastructure. [2001, c. 460, §3 (NEW).]

[2001, c. 460, §3 (NEW) .]

7. **Necessary remedial measure.** "Necessary remedial measure" means any repair or hazard-reducing measure relating to a structural component or operation of a dam needed to mitigate a specific condition at the dam that constitutes a threat to public safety.

[2001, c. 460, §3 (NEW) .]

8. **Person.** "Person" means any individual, firm, association, partnership, corporation, trust, municipality, quasi-municipal corporation, state department, federal department or other legal entity.

[2001, c. 460, §3 (NEW) .]

9. **Public safety.** "Public safety" or "safety of the public" means protection of life, health or property from any condition, event or action at a dam that might compromise the safety, stability or integrity of the dam or its ability to function safely.

[2001, c. 460, §3 (NEW) .]

10. **State dam inspector.** "State dam inspector" means an inspector appointed or hired under section 1117.

[2001, c. 460, §3 (NEW) .]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1112. ADMINISTRATION

The department shall administer this chapter. In carrying out the provisions of this chapter, the department shall consult as appropriate with other state agencies, including the Department of Conservation, the Department of Environmental Protection, the Department of Inland Fisheries and Wildlife, the Department of Marine Resources, the Department of Public Safety, the Department of Transportation, the Maine Land Use Regulation Commission and the State Planning Office, for their aid and assistance. [2009, c. 561, §35 (AMD).]

SECTION HISTORY
2001, c. 460, §3 (NEW). 2009, c. 561, §35 (AMD).

37-B §1113. DUTIES OF THE DEPARTMENT

The department shall inspect existing dams and reservoirs to determine their hazard potential, review the design and construction of new and reconstructed dams, assist dam owners in developing emergency action plans to minimize the effects of dam failure and take all necessary actions in emergency situations of probable dam failure in order to protect life and property. [2001, c. 460, §3 (NEW).]

Except for the Federal Government, a person may not exercise any authority over the emergency regulation or supervision of any dams or reservoirs in the State when that exercise would conflict with the powers and authority vested in the department. [2001, c. 460, §3 (NEW).]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1114. POWERS OF THE DEPARTMENT

1. **Rules.** In accordance with Title 5, chapter 375, subchapter II, the department may adopt, modify or repeal rules for carrying out this chapter. Rules adopted under this section are routine technical rules pursuant to Title 5, chapter 375, subchapter II-A.

[2001, c. 460, §3 (NEW) .]

2. **Emergency situation.** When an emergency situation arises, the commissioner shall warn the public of the emergency and, notwithstanding any other provision of law, shall take all actions necessary to protect life and property, which may include, but are not limited to, the following:

A. Taking full charge and control of any dam or reservoir; [2001, c. 460, §3 (NEW).]

B. Lowering the water level by releasing water from the reservoir; [2001, c. 460, §3 (NEW).]

C. Completely emptying the reservoir; [2001, c. 460, §3 (NEW).]

D. Breaching or removing the dam itself; and [2001, c. 460, §3 (NEW).]

E. Taking other necessary steps to safeguard life and property. [2001, c. 460, §3 (NEW).]

[2001, c. 460, §3 (NEW) .]

3. **Investigations.** For the purpose of enabling it to make decisions as compatible as possible with economy and protection of life and property and for the purpose of determining compliance with this chapter, the department may make necessary investigations and inspections. In making investigations and inspections required or authorized by this chapter, the department or its representatives may, as necessary in emergency situations, enter upon public or private property or in nonemergency situations secure administrative warrants from any District Court Judge or Superior Court Justice for the purpose of gaining entry onto private property.

[2001, c. 460, §3 (NEW) .]

4. **Injunction; civil or criminal proceedings.** In the event of violation of any of the provisions of this chapter or of any rule, order or decision of the department, the department may institute injunctive proceedings or other civil action as provided in this chapter.

[2001, c. 460, §3 (NEW) .]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1115. JURISDICTION

The inspection of and design standards for all dams are under the sole jurisdiction of the department, except that the department does not have jurisdiction over any dam licensed or inspected by any department of the Federal Government or by the International Joint Commission. [2001, c. 460, §3 (NEW).]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1116. DESIGN STANDARDS

All new dams that reasonably will be classified as high or significant hazard potential dams must be designed, constructed or reconstructed under the supervision of a registered professional engineer. Prior to construction, the dam owner shall provide a copy of the plans and specifications to the department. [2001, c. 460, §3 (NEW).]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1117. INSPECTORS OF DAMS

The commissioner shall appoint or hire one or more dam inspectors who are licensed as professional engineers under Title 32, chapter 19 and who are experienced in the inspection and design of dams. [2001, c. 460, §3 (NEW).]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1118. DAM HAZARD EVALUATION

1. **Evaluation.** The commissioner shall evaluate all dams to assign or reassign a hazard potential classification in accordance with the following schedule:

A. New or reconstructed dams, within 6 months of construction or reconstruction; [2001, c. 460, §3 (NEW).]

B. All other dams, at least once every 6 years; [2001, c. 460, §3 (NEW).]

C. Any dam, within 30 days of a request for an evaluation from the dam owner, the municipality in which the dam is located or the emergency management director of the county in which the dam is located; and [2001, c. 460, §3 (NEW).]

D. At any time a dam for which, in the judgment of the commissioner, such an evaluation is appropriate. [2001, c. 460, §3 (NEW).]

Notwithstanding the schedule of this subsection, the commissioner shall evaluate the hazard classification of a significant or high hazard potential dam within 30 days of receipt by the commissioner of a notice of transfer of ownership of the dam as required under section 1128 unless the dam has been evaluated under this subsection within 4 years preceding the notice of transfer of ownership.

Until the commissioner assigns or reassigns a hazard potential classification, a dam retains the hazard potential classification assigned in the 1981 United States Army Corps of Engineers' Inventory of Dams in the United States.

[2001, c. 460, §3 (NEW) .]

2. **Factors considered.** Before assigning a dam a hazard potential classification, the commissioner shall consider the potential risk to public safety and property that may result from the failure or operation of the dam. In addition, when reassigning a hazard potential classification, the commissioner shall review any changes in upstream and downstream conditions since the last hazard classification evaluation.

[2001, c. 460, §3 (NEW) .]

3. **Hazard report.** Before the commissioner assigns or reassigns a dam hazard potential classification, a state dam inspector shall visually inspect that dam and its upstream and downstream environs and provide a report to the commissioner recommending a hazard classification for that dam. The commissioner shall provide a copy of the report by certified mail to the dam owner, lessee or other person in control of the dam,

to the municipality in which the dam is located and to the emergency management director of the county in which the dam is located. The dam owner, lessee or other person in control of the dam must notify the commissioner within 20 days of receipt of the report if the dam owner, lessee or other person in control of the dam disagrees with the recommended hazard classification and must file within 3 months of receipt of the commissioner's classification the basis of the appeal with the commissioner. The commissioner may extend the 3 month period for good cause shown, but not more than an additional 3 months. The commissioner shall consider the evidence presented by the dam owner, lessee or other person in control of the dam as well as the evidence of the state inspector before issuing a final determination.

[2001, c. 460, §3 (NEW) .]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1119. DAM CONDITION INSPECTION

1. **Inspections.** A state dam inspector shall conduct an inspection of all high and significant hazard potential dams to determine whether the integrity, structural stability, function or operation of those dams constitutes a threat to public safety, in accordance with the following schedule:

A. All significant hazard potential dams, at least once every 4 years; [2001, c. 460, §3 (NEW).]

B. All high hazard potential dams, at least once every 2 years; [2001, c. 460, §3 (NEW).]

C. Any dam, within 30 days of a request for an inspection from the dam owner or the municipality in which the dam is located; and [2001, c. 460, §3 (NEW).]

D. At any time any dam that may, in the judgment of the commissioner, constitute a potential risk to public safety. [2001, c. 460, §3 (NEW).]

Notwithstanding the schedule outlined in this subsection, a state dam inspector shall conduct an inspection of a significant or high hazard potential dam within 30 days of receipt by the commissioner of a notice of transfer of ownership of the dam as required under section 1128 unless the dam has been inspected under this subsection within 4 years preceding the notice of transfer of ownership.

[2001, c. 460, §3 (NEW) .]

2. **Condition report.** After the on-site dam inspection, a state dam inspector shall provide a condition report to the commissioner detailing the operation and material condition of the dam and recommending all necessary remedial measures. The commissioner shall send a copy of the state dam inspector's condition report by certified mail to the dam owner, lessee or other person in control of the dam, the municipality in which the dam is located and the emergency management director of the county in which the dam is located if the condition report recommends any necessary remedial measures. The dam owner, lessee or other person in control of the dam must notify the commissioner within 20 days of receipt of the report if the owner disagrees with the findings and recommendations of the report. The dam owner, lessee or other person in control of the dam must provide the basis of disagreement to the commissioner within 3 months of receipt of the inspector's report. The dam owner, lessee or other person in control of the dam may apply for and be granted an extension of this deadline for good cause, but not for more than an additional 3 months.

[2001, c. 460, §3 (NEW) .]

3. **Review conference.** After receiving the inspector's report and prior to issuing any dam safety order, the commissioner shall hold a review conference and shall invite the emergency management director of the county in which the dam is located to the review conference as well as representatives from appropriate state agencies which may include the Department of Conservation, the Department of Environmental Protection, the Department of Inland Fisheries and Wildlife, the Department of Marine Resources, the Department of

Public Safety, the Department of Transportation, the Maine Land Use Regulation Commission and the State Planning Office, to discuss the public safety, environmental, economic and other concerns relating to the dam and the necessary remedial measures under consideration. A state dam inspector shall attend the review conference. The commissioner shall maintain a written record of the conference and shall make a copy of this record available to all parties participating in the conference.

[2009, c. 561, §36 (AMD) .]

4. **Order.** The commissioner shall consider the inspector's report, the evidence presented by the dam owner, lessee or other person in control of the dam and the record from the review conference before issuing a dam safety order directing that necessary remedial measures be undertaken by the dam owner, lessee or other person in control of the dam. The commissioner may issue such an order only if the commissioner determines that the integrity, structural stability, function or operation of the dam constitutes a threat to public safety. Necessary remedial measures may include, but are not limited to:

A. Breach or removal of the dam; [2001, c. 460, §3 (NEW).]

B. Repair or maintenance of the dam in a specified manner; [2001, c. 460, §3 (NEW).]

C. Operation of the dam in a specified manner; [2001, c. 460, §3 (NEW).]

D. Preparation of and adherence to any emergency action that is approved by the commissioner; and [2001, c. 460, §3 (NEW).]

E. Maintenance of appropriate records relating to water levels, dam operation and dam maintenance. [2001, c. 460, §3 (NEW).]

[2001, c. 460, §3 (NEW) .]

SECTION HISTORY
2001, c. 460, §3 (NEW). 2009, c. 561, §36 (AMD).

37-B §1120. ENFORCEMENT

The commissioner may commence an action to enjoin the violation of any provision of this chapter. The commissioner may enforce any order by any other appropriate remedy, including, but not limited to, entering the dam premises to carry out the terms of the order. [2001, c. 460, §3 (NEW).]

The owners, lessees or persons in control of the dam are jointly and severally liable for any costs incurred by the department in carrying out its responsibilities under section 1114, subsection 2 or in enforcing any order. If the owners, lessees or persons in control of the dam refuse to comply or do not fully comply with the department's order, the department shall initiate a civil action against the owners, lessees or other persons in control of the dam for damages in the amount of the costs incurred by the department in enforcing its order. [2001, c. 460, §3 (NEW).]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1121. APPEAL

Any person aggrieved by an order of the commissioner may appeal to the Superior Court under Title 5, chapter 375, subchapter VII. [2001, c. 460, §3 (NEW).]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1122. EXEMPTIONS

Dams licensed by or subject to the jurisdiction of the Federal Energy Regulatory Commission are exempt from this chapter. [2001, c. 460, §3 (NEW).]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1123. RIGHTS OF OWNER

This chapter may not be construed to deprive any owner of recourse to the court in which that owner may be entitled to relief under the laws of this State. [2001, c. 460, §3 (NEW).]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1124. IMMUNITY

An action may not be brought against the State, the department or its agents or employees for any action taken or failure to take action pursuant to this chapter. [2001, c. 460, §3 (NEW).]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1125. RELIEF OF OBLIGATION

This chapter may not be construed as relieving a person of duties, responsibilities or liabilities imposed by any other law, regulation, municipal ordinance or rule of law, including, but not limited to, the need to obtain permits or other approvals required to authorize repairs or other remedial measures at a dam and the need to comply with the terms and conditions of any outstanding water level or dam release order, except in an emergency situation as defined by this chapter. [2001, c. 460, §3 (NEW).]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1126. ACCESS AND NOTIFICATION

1. **Department access.** A state dam inspector and any department staff member must have full access to any dam site under the commissioner's jurisdiction for the purpose of conducting an inspection or enforcing an order under this chapter subject to the Maine Rules of Civil Procedure, Rule 80E.

[2001, c. 460, §3 (NEW) .]

2. **Owners, lessees; necessary access.** The owners, lessees or persons in control of a dam must have access over land abutting the dam site owned by others if the access, including the passage of vehicles, machinery and equipment, is reasonably necessary to comply with an order issued under this chapter. In passing over land owned by abutters, the owners, lessees or persons in control of a dam shall make every effort to minimize the intrusion, shall restore the land to its preexisting condition to the maximum extent practicable and are liable to the abutters for all property damage caused by their activities on the abutters' land. The abutters may not be held liable to any person for any personal injuries or property damage arising from the crossing of their land by the owners, lessees or persons in control of a dam.

[2001, c. 460, §3 (NEW) .]

SECTION HISTORY

2001, c. 460, §3 (NEW).

37-B §1127. EMERGENCY ACTION PLANS

Within 6 months after the determination of classification, the owner of a dam under the commissioner's jurisdiction that is classified as high or significant hazard potential shall prepare an emergency action plan, which must be updated every 2 years. Such emergency action plans must be reviewed for adequacy by the department. Emergency plans must follow a model plan supplied by the department. All emergency action plans must be available and on file at the appropriate local and county government offices and at the department. [2001, c. 460, §3 (NEW).]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1128. NOTICE OF TRANSFER OF OWNERSHIP

Forty-five days prior to any change of ownership of a dam, whether by sale, lease or gift, the owner or owners of a dam classified as a high or significant hazard potential dam shall provide in writing to the commissioner the name and address of the prospective new owner or owners along with any plan that the prospective owner has with regard to maintaining competent operations and correcting unsafe conditions, if any. For purposes of this section, "competent operations" means properly and safely maintaining the dam and ensuring compliance with all safety, environmental and water level rules or orders. [2001, c. 460, §3 (NEW).]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1129. VIOLATIONS

In addition to any other forfeitures or penalties provided by law, a person who violates any provisions of this chapter or any rule or order adopted, promulgated or issued under this chapter is subject to a civil penalty as assessed by the commissioner of not less than $100 nor more than $5,000 for each day that the violation continues. The penalty is payable to the State, to be recovered in a civil action. [2001, c. 460, §3 (NEW).]

SECTION HISTORY
2001, c. 460, §3 (NEW).

37-B §1130. DAM REPAIR AND RECONSTRUCTION FUND

1. **Fund established.** The Dam Repair and Reconstruction Fund, referred to in this section as the "fund," is established within the department. The department shall administer the fund and make low-interest loans from the fund for purposes pursuant to this section. The department may seek assistance from the Finance Authority of Maine in administering the fund.

[2001, c. 460, §3 (NEW) .]

2. **Purposes.** The department may use the fund to provide low-interest loans to municipalities for engineering, legal and construction costs involved in acquiring title to, establishing a long-term management plan for, repairs to, reconstruction of, breaching of or removal of a dam or to pay emergency costs incurred for actions taken pursuant to section 1114.

[2007, c. 167, §12 (AMD) .]

3. **Rulemaking.** The department shall adopt rules to implement this section, including criteria and procedures for the application for and award of low-interest loans from the fund and for repayment of loans to the fund. Rules adopted pursuant to this section are routine technical rules as defined in Title 5, chapter 375, subchapter II-A.

[2001, c. 460, §3 (NEW) .]

4. **Nonlapsing.** Any balance in the fund at the end of the fiscal year may not lapse but must be carried forward to the next fiscal year.

[2001, c. 460, §3 (NEW) .]

SECTION HISTORY
2001, c. 460, §3 (NEW). 2007, c. 167, §12 (AMD).

37-B §1131. ESTABLISHMENT OF COMMISSION

1. **Establishment of commission.** The River Flow Advisory Commission, as established by Title 5, section 12004-G, subsection 13-E and referred to in this section as the "commission," shall act as a technical advisory commission to the department and the Governor's office on issues of flow of the State's rivers and streams. The commission shall also facilitate communication of river flow data between dam operators, river basin managers, state agencies, the United States Geological Survey and the National Weather Service during floods and droughts and shall administer the State's hydrologic monitoring program in cooperation with the United States Geological Survey.

[2001, c. 662, §99 (NEW) .]

2. **Membership.** The commission is composed of these members:

A. The Director of the Maine Emergency Management Agency or the director's designee; [2003, c. 404, §11 (AMD).]

B. The State Geologist or the State Geologist's designee; [2001, c. 662, §99 (NEW).]

C. The Commissioner of Agriculture, Food and Rural Resources or the commissioner's designee; [2001, c. 662, §99 (NEW).]

D. The Commissioner of Environmental Protection or the commissioner's designee; [2001, c. 662, §99 (NEW).]

E. The Commissioner of Inland Fisheries and Wildlife or the commissioner's designee; [2001, c. 662, §99 (NEW).]

F. The Commissioner of Marine Resources or the commissioner's designee; [2001, c. 662, §99 (NEW).]

G. The Director of the State Planning Office or the director's designee; [2001, c. 662, §99 (NEW).]

H. The Commissioner of Transportation or the commissioner's designee; [2001, c. 662, §99 (NEW).]

I. The District Chief of the United States Geological Survey Water Resources Division Maine District Office; [2001, c. 662, §99 (NEW).]

J. The Meteorologists-in-Charge of the National Weather Service Forecast Offices in this State or the designee of the Meteorologists-in-Charge; [2003, c. 404, §12 (AMD).]

K. Representatives from private commerce and industry, including, but not limited to, the major hydroelectric power generators, as determined by the cochairs of the commission; [2003, c. 404, §12 (AMD).]

L. A representative of the public, appointed by the Governor; [2003, c. 404, §12 (AMD).]

M. The Commissioner of Health and Human Services or the commissioner's designee; and [2003, c. 404, §13 (NEW); 2003, c. 404, Pt. B, §7 (REV).]

N. The director of the Senator George J. Mitchell Center for Environmental and Watershed Research at the University of Maine, or the director's designee. [2003, c. 404, §13 (NEW).]

[2003, c. 404, §§11-13 (AMD); 2003, c. 404, Pt. B, §7 (REV) .]

3. **Chair.** The District Chief of the United States Geological Survey Water Resources Division Maine District Office and the Director of the Maine Emergency Management Agency or the director's designee shall act as cochairs of the commission.

[2003, c. 404, §14 (AMD) .]

4. **Terms of office.** The term of office of the public member is 5 years. The public member may be removed from office for cause by the Governor. Members from the State Government or Federal Government shall serve a term coincident with their governmental position. Members from private commerce and industry serve a term as determined by the respective entities that they represent.

[2003, c. 404, §14 (AMD) .]

5. **Voting.** A quorum of at least 7 members must be present for voting.

[2001, c. 662, §99 (NEW) .]

6. **Administrative provision.** The Maine Emergency Management Agency shall administer the affairs and activities of the commission.

[2001, c. 662, §99 (NEW) .]

7. **Records.** The commission shall keep accurate records of its proceedings and shall file them with the Maine Emergency Management Agency.

[2001, c. 662, §99 (NEW) .]

8. **Compensation.** Members of the commission are not entitled to receive compensation.

[2001, c. 662, §99 (NEW) .]

9. **Meetings.** The commission shall meet at least once per calendar year at the call of either of the cochairs to review hydrologic conditions prior to the spring snowmelt and runoff for the purpose of issuing an advisory statement on the potential for major river flooding. Either of the cochairs may call additional meetings as needed.

[2001, c. 662, §99 (NEW) .]

10. **Powers and duties.** The commission has the power and duty only to:

A. Advise the department and the Governor on issues of flow within the State's rivers and streams; [2001, c. 662, §99 (NEW).]

B. Assist in communication of river flow data between dam operators, river basin managers, state agencies and federal agencies; and [2001, c. 662, §99 (NEW).]

C. Administer the State's cooperative hydrologic monitoring program in cooperation with the United States Geological Survey. [2001, c. 662, §99 (NEW).]

[2001, c. 662, §99 (NEW) .]

SECTION HISTORY
2001, c. 662, §99 (NEW). 2003, c. 404, §§11-14 (AMD). 2003, c. 689, §B7 (REV).

Chapter 375: DETERMINATION OF THE SAFETY AND SUFFICIENCY OF A DAM OR RESERVOIR

SUMMARY: This Chapter describes the scope of a darn inspection, the engineering and hydrologic performance criteria that are used in the determination of whether a dam or reservoir is unsafe or insufficient, and the time schedule arid hearing procedures that apply to dam and reservoir inspection.

---

1. Introduction

The determination of the "safety and sufficiency of a dam or reservoir" as defined in 38 M.R.S.A. ə811 shall be made pursuant to this rule. When a dam or reservoir is in addition found to be "unsafe or dangerous to the lives or property of persons residing, carrying on business, or employed near or below the same" (ə812), the inspector of Dam shall recommend alterations, repairs and additions to the dam or reservoir for the protection of life and property. These include but are not limited to recommendations that the reservoir level be lowered in a safe manner, that structural repairs or additions be made to the dam or reservoir,, that certain operating procedures be adopted or implemented, or that the dam or reservoir be removed. Failure of the dam owner to comply with these recommendations may result in court action as described in 38 M.R.S.A. ə812.

2. Scope of Dam inspection

A. The inspector of Dam shall make a safety assessment of a given dam or reservoir with a degree of thoroughness appropriate for the particular facility, taking into account such factors as:

a. consequences of a total failure of the facility

b. stage of life of the project

c. level of safety required

d. nature of the facility and its site

The Inspector of Dam shall first make the appropriate determination of the level of consequences of a complete failure of the darn or reservoir. He shall then determine appropriate criteria for the performance of the facility. Next, he shall make a site inspection in which he searches for any field evidence of possible malfunctions of the facility. During or following the site inspection, the Inspector of Dam shall obtain any available documents on the investigation, design, construction, and performance of the dam.

B Following such site inspection, the Inspector of Dams shall take the testimony of witnesses concerning the safety and sufficiency of the dam or reservoir as provided in 38 M.R.S.A. ə811 and according to the procedure for the conduct of hearings contained in 01-019 CMR

30.4 and .5. For purposes of this chapter, unless the content otherwise indicates, all references to "The Chairman of the Soil and Water Conservation Commission" and "The Commission" which appear in 01-019 CMR 30.4 and .5 shall be deemed to refer to the Inspector of Dams.

3. Decision

A. Following the determination of the consequences of failure, the site inspection and hearing, and appropriate analyses, the Inspector of Dams shall forthwith report his findings and his opinion of the safety and sufficiency of the dam or reservoir to the Commissioner of the Department of Agriculture, Food and Rural Resources. Pursuant to 38 M.R.S.A. ɔ812, said findings and opinion shall include the Inspector's conclusion as to whether or riot such dam or reservoir is unsafe or dangerous to the lives or property of persons residing, carrying on business or employed near or below the same.

B. Such findings and opinion shall simultaneously be mailed to a representative of the petitioners, any intervenors, and the owners of the dam or reservoir. Within fourteen days of their receipt of such findings and opinion, these parties may file with the Inspector proposed findings, written comments, statements and arguments thereon. In the discretion of the inspector, additional time may be granted if the dam or reservoir owner desires to commission, at his own expense, an additional safety assessment of the dam or reservoir. Such request must be made within fourteen days of receipt of the Inspector's findings and opinion. Title 01-019 CMR 30.5M shall apply to these proceedings as modified by the procedures set forth herein.

C. Upon the expiration of the comment period or the Inspector's receipt of an additional safety assessment, as the case may be, the record shall be closed (subject to 01-019 CMR 30.5N). The Inspector shall thereupon issue a final report to the Commissioner of Agriculture, Flood and Rural Resources. In the case of finding a dam to be unsafe, or insufficient, the Commissioner shall notify all interested parties, including owners with riparian rights, municipalities in which the darns are located and any other persons or organizations he deems necessary.

4. Definition of "Unsafe and Insufficient"

A dam or reservoir shall be declared to be "unsafe" or "insufficient" if the Inspector of Dams, after utilizing all available data and testimony and making appropriate calculations using known values or reasonable assumptions, finds that the dam or reservoir does not meet minimum performance criteria appropriate to the facility. The types of performance features that should be evaluated are listed below:

A. Forces acting on the dam and evidence of horizontal translation that suggests there is too much force acting at any time against the facility;

B. Evidence of large total or differential deformation;

C. Evidence of slumps or bulges on the faces of the dam; an end-of-construction or steady state factor of safety against shear sliding and the factor of safety under conditions of reservoir drawdown and during appropriate earthquake loading;

D. Evidence that the phreatic surface within the dam during the full reservoir condition exists on the downstream face of the dam except through properly designed drains; evidence of bulges, seeps, or soft zones on the downstream face of the dam or on the immediate. abutments; evaluation of the effective stress within the dam;

E. Evidence that the dam is experiencing internal erosion of dam material or that the dam abutments or foundation could be subject to piping; an evaluation of internal drain design; an evaluation of seepage gradient within the dam;

F. An evaluation of the quantity and quality of seepage through the dam

G. An evaluation of whether a dam or reservoir is safe from runoff overtopping that could wash out the containment structure. In making this evaluation, the inspector shall consider whether the dam can safely sustain overtopping by the appropriate design storm, and if not, whether an emergency spillway is present. In appropriate cases where it is determined that an emergency spillway should be present, and only one spillway exists, the principal spillway may be considered to serve as an emergency spillway, provided that the principal spillway is large enough so that it cannot be blocked by driftwood and other floating or suspended debris. For each class of structure identified in paragraphs (1), (2) and (3), the inspector shall consider whether an emergency spillway is able to transmit without erosion,, or whether the dam can retain its integrity during overtopping, a storm of the frequency specified

(1) For class "a" structures, which are located in rural, agricultural, or urban areas dedicated to remain in flood tolerant usages where failure may only damage non-residential buildings, agricultural land, floodplains, or township and country roads: 25-year storm or flood;

(2) For Class "b" structures, which are located in predominantly rural or agricultural areas where failure may damage homes, industrial or commercial buildings, highways or railroads, or where failure may cause interruption of use or service of utilities: 100-year storm or flood;

(3) For Class "c" structures, where failure may cause loss of life: maximum probable flood.

H. An evaluation of the minimum freeboard during the reservoir levels that will prevail during the appropriate design storm or flood described in sub-section G above; in a reservoir where landsliding of earth or rack into the reservoir is possible, the potential for wave generation and wave run-up on the dam;

I. Evidence of holes or burrows that could render the dam unsafe;

J. Consequences of inappropriate dam placement;

K. An earthdam shall not be covered by brush, shrubs, or trees;

L. The mechanical facilities that provide control of the water levels in a reservoir shall be in good working order.

5. Qualifications in Declaring a Dam Safe

The Inspector of Dam shall declare a dam or reservoir "safe" if he finds no evidence that the dam or reservoir is unsafe during his field inspection or through his calculations of the safety based upon reasonable assumptions. In a case where the Inspector is of the opinion that there are insufficient field measurements or other data to verify definitively that certain safety criteria have been met (such as described in section 3, Sub-sections A through L), then the Inspector of Dam may declare a dam or reservoir safe subject to further specific studies which he shall recommend to the dam owner. The Inspector may also declare a dam safe subject to review by the Inspector at some later date.

Chapter 3: DESIGN AND CONSTRUCTION STANDARDS FOR NEW OR RECONSTRUCTED DAMS

3.1 GENERAL PROVISIONS

a. In accordance with the provisions of Section 1063, Chapter 22, Title 37-B M.R.S.A., it is the intent of these dam regulations to provide for the proper and safe design and construction of impounding structures not exempt from the law to the extent required for the protection of public safety.

b. These regulations shall not be construed or interpreted to relieve the owner or operator of any impoundment or impounding structure of any legal duties, obligations, or liabilities incident to ownership, design, construction, operation, or maintenance of the impounding structure.

c. These regulations shall not serve to negate nor to satisfy requirements applicable to existing or proposed impounding structures which may be imposed through provisions of other local, state or federal laws, regulations, or ordinances.

d. Any owner who owns, controls, operates, maintains, or manages an impounding structure or impoundment not exempt from the law, or any owner who proposes to perform any of the preceding, or any owner who proposes to construct an impounding structure not exempt from the law, shall engage a licensed Professional Engineer who is practicing in Maine in accordance with applicable laws of Maine to perform any engineering analysis required to comply with these regulations. Such plans and specifications, engineering analyses, and any other document prepared in compliance with the provisions of these dam regulations shall bear the Maine seal of the licensed Professional Engineer who has been engaged to prepare same.

e. These regulations are effective July 1, 1990.

3.2 DEFINITIONS

The following definitions shall apply to the terms used in these regulations:

a. "Agency" means the Maine Emergency Management Agency.

b. "Dam" means. any man-made artificial barrier, including appurtenant works, the site on which it is located and appurtenant rights of flowage and access, which impounds or diverts a river, stream or great pond and which is 2 feet or more in height and has an impounding capacity at water storage elevation of 15 acre-feet or more. Any such artificial barrier constructed solely for the purpose of impounding water to allow timber to be floated downstream in a logging operation shall not be considered a dam for the purposes of this chapter, unless it has been repaired, modified or maintained by or with the knowledge of the owner, lessee or person in control since the discontinuance of its use in connection with logging operations. Any adjacent property, easements, roads, bridges or works not necessary for the operation or maintenance of a dam or access to the dam shall not be included under the provisions of this chapter.

   For the purpose of this regulation, a dam shall be considered an "impounding structure".

c. "Dam reconstruction" means the rebuilding or replacement of all or part of an existing dam that no longer functions in the manner for which it was originally constructed.

d. "Director" means the Director of the Maine Emergency Management Agency.

e. "Emergency Operations Plan" means a set of written instructions or guidelines. for use by public officials which recommends actions which, when implemented, will minimize the effects of a dam failure on people and property.

f. "High or significant hazard" means that condition which poses a risk of loss of human life and substantial property damage.

g. "Public safety" or "safety of the public" means protection of life, health or property from any condition, event or action at a dam which might compromise the safety, stability or integrity of the dam or its ability to function safely.

h. "State Dam Inspector" means an inspector appointed or hired under Section 1064, Chapter 22, Title 37-B M.R.S.A.

i. "Impoundment" means a body of water the storage of which is caused by any existing or proposed impounding structure not exempt from the law.

j. "Owner" means the owner of the land on which is situated, and/or the holder of an easement permitting the construction of a dam and/or any person or entity agreeing to maintain a dam, which includes the State or any of its political subdivisions, including, but not limited to sanitation district commissions and authorities, and public or private institution, corporation, association, firm, or company organized or existing under the laws of this or any other state or country, or any person or group of persons acting individually or as a group.

k. "Design flood" is the runoff, at the site of the impounding structure, utilized in impounding structure design, construction, operation, and maintenance, which will be safely passed by the impounding structure and shall not be less than that recommended spillway design flood commensurate with the size and hazard potential of the particular impounding structure in accordance with the procedures recommended in these regulations.

l. "Design freeboard" means the minimum freeboard which would occur during passage of the design flood.

m. "Inundation zone" means an area that would be inundated in excess of storm water by the water released by the impoundment in the event of a dam breach and is that area which would be inundated immediately downstream from the site of the impounding structure extending to that point on the stream where the calculated water surface profile resulting from the design flood, determined absent the impounding structure, converges with that calculated water surface profile which would result from failure of the impounding structure at the appropriate impounding capacity, with the time of such failure to be considered coincident with the time of occurrence of maximum inflow to the impoundment resulting from the design flood.

n. "Height" means the structural height of a dam which is defined as the vertical distance from the natural bed of the stream or watercourse measured at the downstream toe of the dam to the top of the dam.

o. "Maximum impounding capacity" means normal full pond. It also means the volume in acre-feet that is capable of being impounded at the elevation of the crest of the impounding structure including flash boards if any or the elevation of top of gates, if appropriate.

p. "Impounding capacity" means the volume in acre-feet that is capable of being impounded at the elevation of the crest of the highest ungated outlet from the impoundment.

q. "Life of impounding structure" and "life of the project" means that period of time during which the impounding structure is designed and planned to perform effectively, including that period of time required to remove the structure when it is no longer capable of functioning as planned and designed.

r. "An impoundment constructed, maintained, or operated primarily for agricultural purposes" means an impoundment that is certified by the owner to be such.

s. "Watercourse" means a natural channel having a well-defined bed and banks and in which water flows when it normally does flow.

t. "Acre-foot" means a unit of volume equal to 43,560 cubic feet or 325,853 gallons (one foot of depth over one acre of area).

u. "Flood plain" means those areas adjoining a river, stream or watercourse which have been or hereafter are likely to be covered by flood waters.

3.3 THE CLASSES OF IMPOUNDING STRUCTURES

a. For the purposes of these regulations, existing or proposed impounding structures shall be classified as one of three categories in accordance with Table 1 of this chapter.

b. For the purposes of these regulations, hazards pertain to potential loss of human life or property damage(s) in the flood plain downstream from the structure in event of failure. Structures conforming to criteria for the "low hazard" potential category generally will be found in rural or agricultural areas where failure may damage some farm buildings, limited agricultural land, or country roads. "Significant hazard" potential category structures will be those located in predominantly rural or agricultural areas where failure may damage isolated homes, secondary highways, minor railroads, or other impounding structures or cause interruption of use of service of relatively important pubic utilities. Impounding structures in the "high hazard" potential category will be those located where failure may cause serious damage to homes, extensive agricultural, industrial, and commercial facilities, important public utilities, main highways, railroads, or other impounding structures. Hazard potential classifications shall be proposed by the owner and shall be subject to approval by the Agency. Present and projected development of the flood plain downstream from the impounding structure shall be considered in determining the classification. Impounding structures shall be subject to reclassification as set forth in Section 1065 of Chapter 22, Title 37-B M.R.S.A.

TABLE I

Hazard Potential Classification

Category	Urban Development	Economic Loss
Low Hazard	No permanent structure for human habitation	Minimal (undeveloped to occasional structures or agriculture)
Significant Hazard	No urban development and no more than a small number of habitable structures	Appreciable (notable agriculture, industry, or structures)
High Hazard	Urban development with more than a small number of habitable structures	Excessive (extensive community, industry, or agriculture)

SOURCE: U.S. Army Corps of Engineers

3.4 PROCEDURE(S)

3.41 WHO MUST FILE

An owner who proposes to construct or reconstruct an impounding structure, shall file with the Agency, on forms provided by the Agency for that purpose, a statement concerning the location, purpose, impounding capacity, and height of the existing or proposed impounding structure. If a proposed impounding structure is not exempt from the provisions of the law, construction may not commence until a full and complete filing has been completed with the agency.

3.42 PRELIMINARY REPORT

The owner of a proposed new impoundment or owner of an existing impoundment which is to be constructed or reconstructed shall submit to the Agency a written Preliminary Report regarding the proposed impounding structure. As a minimum, the Preliminary Report shall include the following information:

a. A general description of the impounding structure and appurtenances and a proposed classification as set forth in Section 3.3 of these regulations. The description shall include a statement of the purpose for which the impoundment and impounding structure is to be used.

b. A general description of properties located in the inundation zone downstream from the site of the proposed impounding structure, including the location and number of residential structures, buildings, roads, utilities and other property that would be endangered should failure of the impounding structure occur.

c. A statement from the governing body of the local political subdivision that they are aware of the intent to build or reconstruct an impounding structure and a description of the zoning ordinances and land use classifications applicable to the affected flood plain downstream and upstream from the site of the proposed impounding structure.

d. Maps showing the general location of the proposed impounding structure that include: the county or city in which the (existing or proposed) impounding structure (or would be) located, the location of roads, access to the site, and the outline of the impoundment. Existing serial photographs and existing topographic maps may be used for the purpose.

e. Preliminary drawings of a general nature which include cross sections, plans and profiles of the impounding structure, proposed pool levels, and type of spillways.

f. Preliminary design criteria, including a description of the size, ground cover conditions, and extent of development of the watershed, the geological and the geotechnical engineering assumptions for the foundations and materials to be used.

g. The owner's written request for preliminary and final inspection.

h. Written documentation by the owner's engineers certifying that dam construction will be consistent with final design plans and as-built plans.

i. A schedule for filling the reservoir.

3.43 FINAL DESIGN REPORT

Construction or reconstruction may not commence until a final design report is received by the Agency. The final design report shall include:

a. A report of geotechnical investigations of the foundation soils or bedrock and of the materials to be used to construct or reconstruct the impounding structure.

b. Design assumptions and analyses sufficient to indicate that the impounding structure will be stable during its construction or reconstruction and during the life of the impounding structure under all conditions of reservoir operations, including rapid filling and rapid drawdown of the impoundment.

c. Confirmation of the stability of the reservoir rim area in order to safeguard against reservoir ruin slides of such magnitude as to create waves capable of overtopping the impounding structure and confirmation of stability during seismic activity.

d. Design assumptions and analyses to indicate that seepage in, around, through, or under the impounding structure, foundation, and abutments win be reasonably and practically controlled so that internal or external forces or results thereof will not endanger the stability of the impounding structure.

e. Calculations and assumptions relative to design of the spillway(s).

f. Provision to insure that the impounding structure and appurtenances will be protected against significant deterioration or erosion due to freezing and thawing, wind and rain, or any combination thereof.

g. Other pertinent design date, assumptions, and analyses commensurate with the nature of the particular impounding structure and individual site conditions. When required by the Agency, a delineation of the inundation zone will be prepared by the owner for "high" and "significant hazard" impounding structures.

h. Plans and specifications as outlined in Section 3.54 of this chapter.

i. After verifying that the dam construction methods and design specifications were met, authorization to impound water will be issued prior to filling the reservoir.

j. The Agency shall accept, review, and notify the owner within [45] working days whether the Preliminary Design Report is acceptable or not. The same procedure shall be followed for the Final Design Report.

3.5 DESIGN OF STRUCTURES AND HYDROLOGY

3.51 INVESTIGATION; FOUNDATIONS; CONSTRUCTION MATERIALS, SURVEYS; AND HYDROLOGIC CALCULATIONS

a. The owner shall complete all investigations prior to submitting the design report. The scope and degree of precision required is a matter of engineering judgement based on the complexities of the site and the hazard potential classification of the proposed structure. The geotechnical engineering investigation shall consist of borings, test pits, and other subsurface exploration necessary to define adequately the existing conditions. The investigations shall be performed so as to define the soil, rock, and groundwater conditions.

b. All construction materials shall be adequately specified to insure that their properties meet design criteria. If on-site materials are specified, they shall be located and determined to be adequate in extent and in properties.

c. Surveys shall be made with sufficient accuracy to locate the proposed construction and to define the volume of the storage in the impounding structure. The area downstream from the proposed impounding structure shall be investigated in order to delineate the areas and extent of potential damage in case of failure. Locations of center lines and other horizontal and vertical control shall be shown on a map of the site.

d. The drainage area shall be determined. Present and projected conditions shall be reasonably considered in determining the runoff characteristics of the drainage area. All hydrologic assumptions shall be included in the design calculations which shall be submitted as part of the design report.

e. Periodic inspections will be conducted by a qualified Dam Inspector during the construction or reconstruction of all dams in this State. Additionally, written reports noting all conditions found will be forwarded to the Director, MEMA, within 15 working days. Conditions affecting public safety of employees shall be forwarded to the Director at the earliest opportunity.

3.52 THE DESIGN FLOOD

The magnitude of the minimum design flood to be utilized in impounding structure design, construction, operation, and maintenance shall not be less than the recommended spillway design flood commensurate with the size and hazard potential of the particular impounding structure in accordance with the recommended procedures contained within the Corps of Engineers published guidance and those which are incorporated in these regulations by reference to the extent they are not inconsistent with other provisions of these regulations and existing laws of Maine.

3.53 SPILLWAY DESIGN

a. Every impounding structure shall have a spillway system with adequate capacity to discharge water in keeping with potential hazards involved without endangering the safety of the impounding structure.

b. A spillway shall be required, unless it is demonstrated by the applicant that adequate capacity is provided by other means to prevent endangering the integrity of the impounding structure.

c. A vegetated earth or unlined emergency spillway may be approved when demonstrated that it will pass the spillway design flood without jeopardizing the safety of the structure.

3.54 PLANS AND SPECIFICATIONS

The plans and specifications for a new or reconstructed impounding structure shall consist of the following as a minimum:

a. The name of the project; the name of the owner; classification of the impounding structure as set forth in Chapter 3 of these regulations; designated access to the project; and the location with respect to highways, roads, streams, and existing impounding structures and impoundments that would affect or be affected by the proposed impounding structure.

b. Cross sections, profiles, logs of test borings, laboratory and in situ test data, drawings of principal and emergency spillways, and other additional drawings in sufficient detail to indicate clearly the extent and complexity of the work to be performed.

c. The technical provisions, as may be required to describe the methods of construction and construction quality control for the project.

d. Special provisions, as may be required to describe technical provisions needed to insure that the impounding structure is installed according to the approved plans and specifications.

Plans and specifications shall be submitted with the final design report.

e. The owner shall notify the Agency of any proposed changes in design, plans, and specifications that will affect the safety of the impounding structure.

3.6 CONSTRUCTION SCHEDULE

3.61 The applicant shall submit a construction schedule with the final design report that includes:

a. A time and construction sequence schedule that includes the estimated time to complete the construction activities.

b. Techniques to be used to divert stream flow during construction to prevent hazard to life, health, and property.

c. A plan of quality control testing to confirm that materials and construction methods met the design requirements set form in the specifications.

3.7 ACCEPTABLE DESIGN PROCEDURE AND REFERENCES

3.71 The following are acceptable as design procedures and references:

a. The design procedures, manuals, and criteria used by the United States Army Corps of Engineers.

b. The design procedures, manuals, and criteria used by the United States Department of Agriculture, Soil Conservation Service.

c. The design procedures, manuals, and criteria used by the United States Department of the Interior, Bureau of Reclamation.

d. The design procedures, manuals, data, and criteria used by the United States Department of Commerce, National Weather Service.

HAZARD CLASSIFICATIONS
&
DANGER REACH STUDIES FOR DAMS

By

Bruce W. Harrington, P.E.
MD Dept. of The Environment
Dam Safety Division

To determine the hazard classification of a proposed dam[1] or reevaluate the hazard classification of an existing dam, an incremental flood analysis is required. The first step in an incremental flood analysis is to determine downstream flood depths and velocities without the dam to establish baseline flooding conditions. The second step is to determine the increased flood depths and velocities associated with dam failures during the same hydrostatic and hydrodynamic loading conditions. These loading conditions include several storm events that will or could occur during the lifespan of the dam. The storms to be examined include the following loading conditions: 1) normal pool, 2) 100-year flood, 3) brim-up flood, 4) 50% probable maximum flood (PMF) and 5) PMF.

The normal pool or sunny day loading condition is the breach flow released from the dam during a normal pool failure. If there is no permanent pool, a sunny day failure would be assumed to occur at the first large opening in the principal spillway above the low flow outlet. The storm event that fills the reservoir up to the top of dam is the brim-up storm event. This storm event can be determined very quickly by selecting a few rainfall events larger than the design storm and routing them through the spillways. The PMF is the largest flood that is expected to occur on a watershed. The PMF is based on the most severe combination of meteorological and hydrological conditions that are reasonably possible.

In Maryland, all significant and high hazard dams require an emergency action plan to safeguard lives and reduce property damage in the event of a dam failure. In order develop an emergency action plan for an existing or proposed dam, a danger reach map must be completed. *If the hazard classification of an existing dam is well known, only a danger reach study is needed to define the downstream reach that would receive increased flooding if the dam were to fail.*

The hazard classification of the dam is usually based on the increased flood depths and velocities against or over downstream structures. These structures include houses, buildings, important utilities, roads and railroads. The U.S. Bureau of Reclamation Flood Danger Graphs[2] shown on pages 5, 6, and 7 of this document are used to determine if increased flood dangers will exists with a dam failure. If the depths and velocities with a dam failure increase from low to high danger as shown on the graphs, the dam would be classified as significant or a high hazard structure depending on the type of structure flooded and the probable loss of life. The definitions of low, significant & high hazard classifications for dams are defined on page 3.

[1] A dam also refers to an embankment pond or a road embankment used for stormwater management.
[2] "Downstream Hazard Classification Guidelines" ACER Technical Memorandum No. 11, USBR, 1988

After the hazard classification of the dam has been defined, the danger reach is typically determined by failing the dam during the normal pool and design storm loading conditions, and routing the dam failures downstream to a point where the increased flood depths are less than one foot. A low, significant, or high hazard dam is usually designed to safely pass the 100-year storm, 50% PMF, or PMF, respectively. The minimum freeboard above the design storm to the top of the dam is one foot but may be increased if there is no emergency spillway or if wave run-up is significant.

Dam Failure

A dam failure hydrograph is computed by the HEC-1 or National Weather Service (NWS) Dam-Break Models. For dams equal to or greater than 75 feet in height, the NWS Dam-Break Model is required. For dams smaller than 75 feet high, the HEC-1 or NWS Dam-Break Models may be used to determine the breach hydrograph. Although the NWS Dam-Break Model is considered to be the most accurate model to determine dam failures, it is also very complex and temperamental, and requires considerable engineering expertise.

To determine the dam failure hydrograph, four parameters are needed to define the breach formation through the dam. These parameters include the breach bottom width, side slopes, time of failure, and the selected failure and breach bottom elevations. For earth embankment dams, the average breach width ranges from 1 to 5 times the height of water against the dam at failure; the breach side slopes range between 0 to 1 foot horizontal to 1 foot vertical; and the time of failure ranges from about 10 minutes for small dams to approximately 4 hours for very large dams. In 1987, Froelich developed breach predictor equations that estimate the average breach width and time of failure based on the height of water above the breach bottom and the corresponding storage volume. These equations, which were revised by Froelich in 1995, are included on page 12 of this document. Examples of input data for the HEC-1 and NWS Dam-Break Models can be obtained by contacting the Maryland Dam Safety Division.

Hydrology

To determine the storms used for hazard classifications or danger reach delineations, the HEC-1 or TR-20 Computer Models are required for drainage areas less than or equal to 10 square miles. For dams less than 10 square miles of drainage area, use a 24-hour duration rainfall for the 100-year and brim-up storm events; and a 6-hour duration rainfall for the 50% PMF and PMF. For drainage areas larger than 10 square miles, the HMR-52 Model is recommended to determine the rainfall amount and distribution. The rainfall hyetograph data from the HMR-52 Model is inputted into the HEC-1 Model for flow computations.

I. Compute Storm Events and Breach Flows in the Danger Reach Area Below the Dam

A. Calculate runoff, flows, and hydrographs (hydrology) on the watershed above the dam and the danger reach area below the dam for the 100-year, brim-up, 50% PMF, and 100% PMF storm events. (**HEC-1, TR-20, & HMR-52 Models**).

B. Route storms as well as sunny day failure through dam and downstream floodplain with & without dam failure. ***If the hazard classification of the dam is known, only the sunny day and design storm (PMF for High Hazard Dams) are necessary to define the danger reach limits.*** The danger reach must extend downstream to a point where the increased flood levels is less than one foot.

Hydraulics

Compute the existing and proposed water surface elevations for the selected storm events. The HEC-1, HEC-2, HECRAS, or National Weather Service Dam-Break Models are used to determine the flood depths. For drainage areas less than 10 square miles, the HEC-2 or HECRAS Models are recommended because they are easy to learn and apply, and provide reasonably accurate water surface elevations.

For danger reaches that impact only downstream roads and a few buildings, the HEC-1 Model may be used for both hydrology and hydraulic calculations. The HEC-1 Model is not as accurate in calculating the depth of flooding because the floodplain cross sections are not detailed and the water surface slopes are approximated. To use only the HEC-1 Model for hydrologic and hydraulic computations, discuss the dam failure study with the Dam Safety Division for approval.

I. Calculate The Water Surface Profiles Both With and Without Dam Failure in The Danger Reach

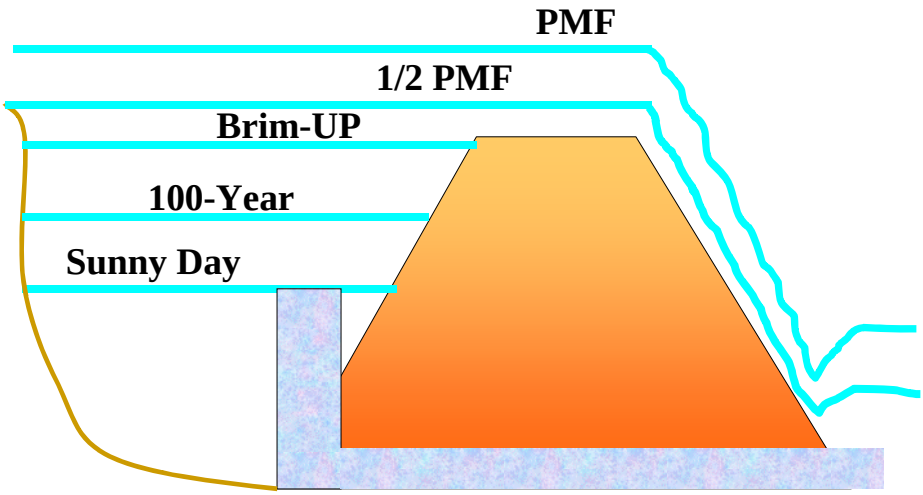
A. Input flow values, stream cross-sections, Manning's roughness values, and dam & road structure data into the water surface profile models.

B. Determine increased flood risks to houses, buildings, and roads by using the enclosed USBR Hazard Graphs.

II. Determine Hazard Classification of Dam

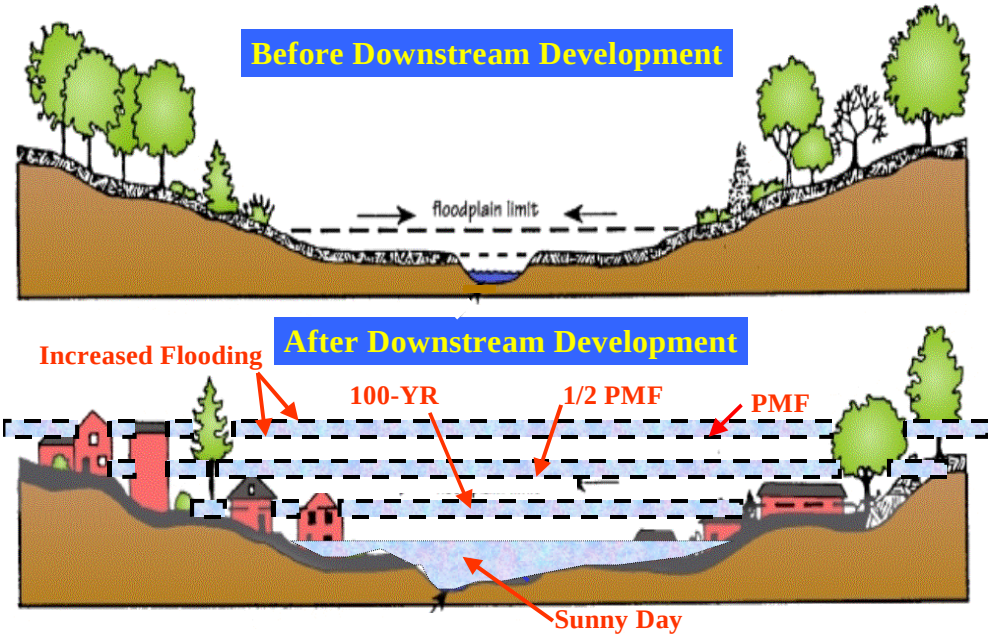
A. Classify or reclassify dam as a low, significant, or high hazard structure.

1. Low Hazard - Unlikely loss of life; minor increases to existing flood levels at roads and buildings.



2. Significant Hazard - Possible loss of life, significant increased flood risks to roads and buildings with no more than 2 houses or 6 lives in jeopardy.

3. High Hazard - Probable loss of life; major increases to existing flood levels at houses, buildings, major interstates and state roads with more than 6 lives in jeopardy.



III. Develop Danger Reach Maps

A Plot the flood boundaries for the sunny day and design storm dam failures on topographic maps. The map must clearly show downstream roads, buildings, and houses within the danger reach, and the recommended evacuations routes. The danger reach maps are to be included in the Emergency Action Plan for the dam and should be no larger than 11" x 17" per panel.

26.17.04.05

.05 Dams and Reservoirs.

A. In addition to the general requirements in Regulation .04 of this chapter, the following special requirements shall apply to applications for dams and reservoirs:

(1) A person who applies to construct, reconstruct, repair, or alter a dam or reservoir shall engage a registered professional engineer, practicing in accordance with the laws of Maryland and qualified in the field of dam design and construction to prepare the designs and specifications and to provide supervision during construction of the proposed works. The engineer shall be the engineer-in-charge and shall:

(a) Be responsible for assuring that the designs conform to the high standards of professional competence in the specialty of dam design and construction;

(b) Assure that the construction is carried out in strict accordance with the approved plans and specifications and under the provisions of the permit; and

(c) Submit to the Administration a resume of all previous dam design and construction experience, listing specific responsibilities and a written certification of qualification to act as the engineer-in-charge.

(2) If an engineering team is planned for the design and construction, one registered professional engineer shall act as the engineer-in-charge. However, each individual on the project team shall document that individual's area of responsibility and technical experience. This documentation shall accompany the permit application.

(3) Making Application. The procedure for obtaining a permit for construction, reconstruction, repair, or alteration of a dam or reservoir is established in two steps:

(a) Step One. Plan Development Phase of Permit for a Waterway Obstruction. The applicant shall first obtain the Administration's written approval of the classification of the dam as outlined in §B of this regulation. The applicant shall then submit to the Administration an application which includes a feasibility report. Upon approval of the completed application, the Administration shall issue a Plan Development Permit. The decision of the Administration to issue or deny a Plan Development Permit shall constitute a final decision for the purposes of appeal to the Board of Review pursuant to Natural Resources Article, §1-107, Annotated Code of Maryland. The feasibility report shall include the following:

(i) Objectives and purposes of the project.

(ii) Alternate proposals studied.

(iii) General description of proposed dam and reservoir, including a plan view and cross section.

(iv) Conclusions on the dam site and adjacent valley walls and floor based upon geologic maps, surface investigations, seismic, geophysical, or geotechnical studies, or any preliminary soil borings made.

(v) Conclusions on the safety and effectiveness of the dam in impounding water.

(vi) Hydrologic studies including the determination of the inflow design flood, the danger reach, and the proposed operation of the dam and reservoir.

(vii) A map showing the project location, ownership of land affected, and showing any existing or proposed water or sewer lines, pipelines or electric transmission lines crossing the impoundment area and their planned relocation or protection. The map shall also show the location of other existing or proposed dams, reservoirs or other water resource projects, whose conditions of flow or operations may affect or be affected by this proposed project.

(viii) Type and source of materials to be used in construction. When natural materials (earth, rock, etc.) are to be used, the engineer shall indicate the approximate structural properties and availability of each kind of material.

(ix) Photographs of the proposed site.

(x) Estimated benefits from the project, including the design life of the project.

(xi) Estimated cost of the project and length of time required for construction of the structure and filling of the reservoir.

(xii) The owner's written assurance that funds will be available to complete the project as planned and for continued maintenance of the project throughout the life of the structure.

(xiii) An environmental study that includes measures to preserve or enhance the aesthetic, scenic, and wild values at the project site and upstream and downstream of the project. If the project is on a stream within the State Scenic and Wild Rivers Program, this information shall include measures to be taken to preserve the aesthetic and scenic values and the wild qualities of the stream.

(xiv) Foundation investigations shall define the location, type, strength, and other pertinent characteristics of the foundation material. Foundation investigations shall further disclose ground water conditions and other applicable information necessary for analysis of possible seepage problems.

(xv) Topographic surveys shall be made in sufficient accuracy to define the volume of storage in the reservoir and the flow limits. Property lines shall be shown in order that any potential effects of the water in the reservoir on adjacent properties may be determined. The downstream area shall be investigated and, if necessary, surveyed in order to establish the area of potential damage in case of failure.

(xvi) Establishment of proposed minimum releases after the reservoir is filled.

(b) Step Two. Construction Phase of Permit for a Waterway Obstruction. Before the Administration may issue a construction permit for the dam or reservoir, a separate permit application shall be accompanied by final construction plans, specifications, and other information that may be required. Final construction plans, specifications, and other data required before a permit may be issued shall include the following:

(i) Design report with all pertinent computations, including: geology (location and logs of soil and rock borings, conclusions, etc.); soil or rock mechanics tests; hydrology; design criteria; hydraulic design (flood routing, stage storage curve referenced to the lowest drain, velocities in downstream channel, etc.); structural design; stability analysis (including rapid drawdown); and, quantities and cost estimates.

(ii) Construction plans and location sketch, showing borrow areas, spoil areas, etc.

(iii) Construction specifications.

(iv) Provisions for minimum releases during construction and reservoir filling.

(v) Time schedule for construction.

(vi) Approved grading and sediment control plan, showing the measures for controlling sediment loss during and after construction.

(vii) Maintenance plan describing the steps to be followed by the owner to provide for the continued maintenance of the dam and reservoir during the expected life of the structure. This plan shall describe what work is to be called for at periodic intervals or when necessary to keep the structure in good condition. Among other items it shall address mowing or cutting of brushy growth on embankments, preventing erosion or gullying of embankment surfaces, clearing of toe drains, the prevention of accumulation of trash and debris, the protection against rust and spalling, and the exercise of valves or other mechanical equipment. The description of this program shall be submitted to this Administration for approval and inclusion among the required conditions of the construction permit.

(viii) Operations plan describing the steps to be followed by the owner to provide for the safe operation of the dam and reservoir and the continued minimum releases, withdrawals, etc.

(ix) A warning plan for Category I and Category II dams describing the steps to be followed in notifying persons whose lives, property, or health may be endangered by failure, improper operation, or other circumstances affecting the safety of the dam. The warning plan shall identify the most practical and expeditious means for notifying potentially affected persons in close proximity to the dam or property owners.

(x) A requirement by the Administration that the applicant post a construction bond, irrevocable letter of credit, or other security acceptable to the Administration to assure that funds are available to complete the construction of the proposed project and for continued maintenance of the project throughout the life of the structure.

B. Structure Classification and Design Criteria.

(1) Classification of Dams. The following table sets forth judgmental factors for minimizing the risk associated with the design of dams. The table is intended only as a guide. A proposed dam shall satisfy all four factors (normal pool storage volume, normal depth, potential for loss of life, and potential for damage) in order to avoid classification in a more rigorous category. Failure damage potential shall consider future development and use of the area flooded throughout the danger reach and the damage which would be expected from a complete breaching of the dam. If, in the opinion of the Administration, future development is probable in the area flooded throughout the danger reach, the dam shall be classed in Category I. The classification of the proposed dam shall be assigned by the Administration after the applicant has provided information on the potential damage within the danger reach, as defined herein. After the classification has been assigned, the inflow design flood and spillway design may be established. Dams qualifying for the Category III classification may be classed in Category IV, if all of the requirements of Environment Article, §5-503(b), Annotated Code of Maryland, are met with the exception of §5-503(b)(1).

GUIDE TO CLASSIFICATION OF DAMS

Category	Normal Pool Storage Volume in acre-feet)	Normal Depth (in feet)	Potential for Loss of Life	Potential for Damage
I	20,000 or more	50 or more	probable	Serious damage to: residential, industrial, or commercial buildings; important public utilities, public roads; or railroads
II	1,000 or more and less than 20,000	25 or more and less than 50	small possibility	Located in predominately rural or agricultural areas where failure may cause damage to isolated residences or cause interruption of use or service of public utilities or roads. Damage is within the financial capability of owner to repair.
III	less than 1,000	less than 25	very unlikely	Damage is of same magnitude as cost of dam and within the financial capability of owner to repair.
IV*	less than 100	less than 15		

*Category IV is reserved for those structures which have a contributing drainage area of less than 1 square mile (640 acres), and a normal depth of water less than 15 feet above the original stream bed, and a normal surface area less than 12 acres.

(2) Danger Reach. A danger reach shall be established for all proposed dams by routing a flood hydrograph resulting from a failure of the structure. Computation of the danger reach is an iterative process and, based upon the potential for damage and loss of life, may necessitate reclassification to a higher category by the Administration. The danger reach shall be established using methods that compare the depth and aerial extent of the flood waters without and with the proposed dam as follows:

(a) The inflow design flood shall be flood routed throughout the downstream valley without the proposed dam in place.

(b) A dam-breach flood wave shall be routed throughout the downstream valley assuming failure of the dam. The following procedures are incorporated by reference and shall be considered acceptable by the Administration:

(i) DAMBRK-The NWS Dam-Break Flood Forecasting Model, The Hydrologic Engineering Center, U.S. Army Corps of Engineers, February, 1984;

(ii) HEC-1 Flood Hydrograph Package, Computer Program 723-X6-L2010, The Hydrologic Engineering Center, U.S. Army Corps of Engineers, September, 1981 (Revised January, 1985);

(iii) Technical Release Number 66, Simplified Dam-Breach Routing Procedure (Revised December, 1981).

(c) Under §B(2)(b) of this regulation, consideration shall also be given to the peak discharge caused by the design storms in the uncontrolled area below the dam, together with the flow over and through the dam.

(3) Inflow Design Flood. The inflow design flood for Category I dams shall be the probable maximum flood. For Category II dams the inflow design flood shall be the standard project flood or the largest flood of record, whichever is greater. For Category III dams the inflow design flood shall be one having a recurrence interval of once in 100 years or longer. For Category IV dams the inflow design flood shall be as defined in USDA, Natural Resource Conservation Service, Maryland Conservation Practice, Standard Pond Code 378 (January, 2000), which is incorporated by reference in COMAR 26.17.02.01-1B(2). Criteria shall be provided or approved by the Administration for each of the above inflow design floods.

(4) Spillway Design. Established procedures for spillway design and capacity, when properly applied, will be accepted by the Administration. The effects of storage may be taken into account in establishing spillway capacity and top of dam. All spillways shall be designed to adequately handle debris either by trash racks or with sufficient opening. All dams shall have an overflow spillway included in the design. A constructed earthen embankment may not be used as an overflow spillway. All dams classed in Category I or II shall be designed with an emergency spillway which passes the inflow design flood without endangering the dam and whose predicted frequency of use is not greater than once in 100 years. Adequate provision shall be made to dissipate the energy of water flowing over or through the dam and to protect the downstream toe of the dam.

(5) Dams in Category IV. The designs, plans, and specifications for all dams not approved by the soil conservation district and classed in Category IV shall be reviewed by the Administration for technical compliance with the requirements in USDA, Natural Resource Conservation Service, Maryland Conservation Practice, Standard Pond Code 378 (January, 2000), which is incorporated by reference in COMAR 26.17.02.01-1B(2).

C. Design Specifications.

(1) Design References. References used by the designer shall be cited in the application submitted to the Administration, especially where unusual features are incorporated in the design.

(2) Freeboard. The design shall allow for certain freeboard as a minimum, not to be reduced under any circumstances during the operation of the dam and reservoir. The design freeboard is for that reservoir stage which will exist when the pool has reached maximum level during the inflow design flood with the outlet works and overflow spillway operating as planned. The freeboard is to be calculated to prevent overtopping and protect the dam against the destructive forces of waves, frost, settlement, and surface erosion.

(3) Safety Factor. The safety factor shall be that used in good engineering practice in dam design. In all important structural features, the safety factor used shall be shown in the design assumptions. The Administration requires a safety factor of at least 1.5 to be included in the structural design of the dam or any of its components during steady state seepage conditions, and at least 1.2 during rapid drawdown of the reservoir pool from the spillway crest. If site conditions or the downstream hazard category warrants, the Administration may require a safety factor of greater than specified in this section.

(4) Drains. Dams shall include a device to allow draining of the reservoir within a reasonable amount of time. The following factors shall be considered in determining the reasonable time period for drainage:

(a) The risk and nature of a potential dam failure;

(b) The time likely to be available to avert a failure after notice of conditions threatening the safety or stability of the

dam; and

(c) The influence of rapid drawdown on the stability of the dam, its appurtenant works, and the natural upstream slopes of the reservoir.

(5) Specifications. Specifications shall be written to assure that design criteria, with regard to the quality of the materials and methods of construction, will be met or exceeded.

(6) Providing Means for Inspections. The Administration may include, either at the time of granting a permit for construction of a dam or at a later date, a requirement that the owner provide and install devices necessary for the future inspection and surveillance of the dam. The number, type, and location of the devices shall be determined as a result of the Administration's evaluation of the size and nature of the dam, the complexity of local natural conditions, and the degree of risk resulting from any future deterioration or failure. The requirement may include provisions for the measurement of the settlement of the crest or slopes of dams, the movement of walls in the valley or reservoir, the increases in pore-water pressure in earth or the increases in flow from drainage systems, and the installation of other devices required to detect serious changes in the structure or the affected area to allow the repair of deficiencies before more serious risk develops.

(7) Multiple Dams. When dams are spaced so that the failure of an upstream dam or structure could endanger the safety of one downstream, the possibility of a multiple failure shall be considered in reviewing the design. Additional safety shall be provided in either structure by increasing the retarding storage or increasing the emergency spillway capacity, or both.

D. Construction Requirements.

(1) Construction shall be under the supervision of the engineer-in-charge as defined in §A(1) of this regulation.

(2) Appropriate tests, as required by the Administration, shall be made of materials used in the construction of the dam. Materials failing to meet applicable specifications shall be removed and replaced with acceptable materials.

(3) The engineer-in-charge shall submit periodic construction progress reports to the Administration. Progress report forms and the frequency of reporting will be provided by the Administration before construction.

(4) A history of the construction shall be maintained by the engineer-in-charge, and shall include:

(a) Date, location, and results of all materials tests made.

(b) Narrative of problems encountered during construction and changes in design. Necessity for these changes shall be reported to the Administration for approval before proceeding with construction.

(c) "As built" plans.

(5) The above information shall be maintained at the construction site. The information shall be submitted to the Administration within 60 days after the completion of the dam and shall be accompanied by the written certification from the engineer-in-charge to the Administration that the completed structure has been constructed in accordance with plans and specifications and changes approved by the Administration. The Administration shall supply certification forms.

(6) Before beginning the diversion of the streamflow through a temporary channel or conduit in order to dewater the foundation of the dam, the engineer-in-charge shall submit a plan to the Administration for approval describing the methods to be used for carrying the streamflow and keeping sediment reduced during this period. The engineer-in-charge shall be responsible for the implementation of the plan.

(7) Before beginning the filling of the reservoir the engineer-in-charge shall submit a report to the Administration stating that the structure has been made ready for filling and that the pool area has been cleared of debris. The report shall describe the limitations on the amount of water restrained from flowing downstream and describe the methods to be followed for the surveillance of the project during the period when the structure is receiving its initial loading.

E. Surveillance and Inspection of Completed Dams and Reservoirs.

(1) Responsibility for Inspections by Owner. The owner is responsible for the safety of the dam and for the necessary surveillance and inspections. The surveillance shall be performed by the owner, or a representative of the owner, and shall provide a close watch on the conditions affecting the dam's safety. The owner shall promptly notify the Administration of significant changes in condition.

(2) Responsibility for Inspections by Administration. In addition to the inspections by the owner, the Administration shall make inspections of all dams, reservoirs, and other waterway obstructions within its jurisdiction to provide for the public safety and welfare, to detect early signs of deterioration, and to enforce corrective measures. The Administration's agents shall be given free access to every part of the dam or reservoir under consideration, and the operators of these works shall assist in the inspection to the best of their abilities.

F. Repair of Dams. Before beginning the repair of any dam or reservoir, the owner shall apply for, in writing, and secure the Administration's written approval of the contemplated action. The application shall give the name and address of the applicant, details of the proposed changes, referenced to the existing structure, and shall be accompanied by the necessary plans and specifications. If the proposed work may best be explained by description, this description shall be included as part of the application along with the proposed time of commencement and completion of construction, as well as such other information as the Administration may require. In the event of an emergency in which repairs are necessary to safeguard life and property against predicted immediate danger, these repairs shall be made immediately by the owner. In these events, the Administration shall be notified within 24 hours of the emergency repairs needed and the extent of work underway, if any, and the work shall conform to these requirements as specified by the Administration.

G. Certain Small Ponds. Except for those ponds which are to be located in natural trout waters or those which are temporary and which are intended solely to trap sediment during construction operations, certain small ponds may be exempt from the permit requirements cited here if the plans and specifications are approved by the appropriate soil conservation district. The following shall apply to the approval of all ponds pursuant to Environment Article, §5-503(b), Annotated Code of Maryland:

(1) The plans and specifications shall be reviewed for technical compliance with the requirements in USDA, Natural Resource Conservation Service, Maryland Conservation Practice, Standard Pond Code 378 (January, 2000), which is incorporated by reference in COMAR 26.17.02.01-1B(2).

(2) The soil conservation district shall notify the Administration of all ponds approved pursuant to this section. The notification shall include a copy of the pond approval and a pond summary sheet. The notification shall be submitted to the Administration within 30 days of the end of each quarter (September 30, December 31, March 31, and June 30) in which the approval was granted.

(3) The soil conservation district, for all ponds approved pursuant to Environment Article, §5-503(b), Annotated Code of Maryland, shall submit a certification to the Administration within 90 days after the completion of construction. This certification shall state that the subject pond was constructed in conformance with the approved plans and specifications. A certification by a professional engineer, land surveyor, or landscape architect practicing in accordance with the laws of Maryland shall be acceptable to the Administration instead of a certification by the soil conservation district.

Maryland Dam Safety Manual

1996 Edition

(rev. November 2003)

PREFACE

This manual was developed by the Maryland Department of the Environment, Water Management Administration, Dam Safety Division, in order to assist owners in the regular operation, inspection, and maintenance of their dam. The information presented should also be valuable to many engineers who are preparing construction documents for a proposed structure. It is intended to serve as an information resource and educational tool for the dam owner and includes six basic sections: Owner Responsibilities, Operation, Maintenance and Repair, Inspections, Construction, and Emergency Procedures. It is hoped that this manual will be of assistance to the dam owner in becoming familiar with the general principles and features of their facility as well as developing adequate skills of observation and safety inspection. Timely maintenance can reduce expensive safety repairs at a later date.

Dam owners must maintain their facility in a safe condition. For this reason the main focus of this manual is directed towards developing an operation and maintenance program for the dam owner. Throughout the manual, it is recommended that the owner contact an engineer experienced with dams when certain observations are made. The importance of this recommendation cannot be overemphasized. Dams are complex structures and the causes and remedies of certain problems may not be obvious to a layperson.

This manual was prepared and revised under the guidance of the Maryland Dam Safety Division including Brad Iarossi, Harald Van Aller, Bruce W. Harrington, M.Q. (Cas) Taherian, Gene Gopenko, Robert S. Norton, Brian S. Clevenger, and Tona Ives. The manual was modeled after similar publications developed by the Ohio Department of Natural Resources, Division of Water, Dam Inspection Section; the North Carolina Department of Natural Resources and Community Development, Division of Land Resources, Land Quality Section; and the Commonwealth of Pennsylvania, Department of Environmental Resources, Division of Dam Safety. In addition, similar publications from many other states were also of considerable assistance. Funds for the development and distribution of this manual were provided by the Association of State Dam Safety Officials through a grant from the Federal Emergency Management Agency.

INTRODUCTION

A dam is defined as any obstruction, wall, or embankment, together with its abutments and appurtenant works, constructed for the purpose of storing water. Dams may be constructed of earth, concrete, wood or rock. Most dams in Maryland consist of an earthen embankment to store water and a combination of spillways designed to pass water safely around or through the facility.

Millions of Marylanders are dependent on dams for water supply, flood control, power generation, recreation and irrigation. High standards including proper design and construction of dams, properly operated and well maintained dams and effective emergency warning plan can help prevent dam failures, save lives and property and enable us to continue to enjoy the benefit that dams provide.

Dams represent a potential danger. With the exception of a nuclear power plant, few manmade structures have the potential to cause catastrophic disaster as dams do if they fail. This country has witnessed some tremendous tragedies caused by dam failures including:

1) The South Fork Dam failure (Johnson Flood) of 1889 which took the lives of 2,209 people in Johnstown, Pennsylvania;

2) The Buffalo Creek Dam failure in 1972 killed 125 people in West Virginia;

3) The Teton Dam failure of 1976 caused 14 deaths and over $400 million in damages;

4) The Laurel Run Dam failure in 1977 killed 40 people in Pennsylvania; and

5) The Kelly Barns Dam failure in 1977 killed 39 people and $2.5 million in damages.

For centuries, dams have provided mankind with the essential benefits associated with water. Modern dams are often integrated into new communities to such a degree that they become a part of the landscape and are forgotten as an engineering structure that needs periodic maintenance. However, a well documented operation and maintenance program is necessary for every dam in order to detect symptoms of deterioration and plan for timely maintenance. Every program should include:

1) periodic technical inspections,
2) periodic maintenance inspections, and
3) informal observations by the dam owner.

BUFFALO CREEK DAM FAILURE FEBRUARY 26, 1972

The following accounts of this tremendous tragedy are excerpted from Everything in Its Path written by Kai T. Erikson, 1976.

"I walked to the back porch and saw my neighbors running and screaming. I heard one say 'the dam.' I then came running through the house and told my wife to head for the hills. When I got to the living room I saw the water rolling by the window. I knew then there was no way out of the house, and all hope just vanished. My wife started crying and praying. I saw a housetop going by with a friend of mine on top. Then I heard a big crash and saw the big wave of water coming with houses and trash in it. There was nothing we could do but watch and pray for the best and wonder how long our house would stand."

"And we stood there so helpless, couldn't do nothing. We were there watching people trying to get out of the way, and the water just swept them right down."

"One of our very close friends stayed drunk for almost five months because he could still hear his brother and sister screaming for their mother and his mother screaming 'God help us' when the water hit them. Sometimes he talks with me about it and I get the impression that he feels bad because he lived through it all. He is only twenty years of age, but I guess sometimes he feels like a thousand years old."

"I looked up the road and saw it coming, the water. I said, 'Here comes a big old doll.' But when it got to me, I said 'Lord, that's a kid,' and I took off down the creek after it."

"I can't forget the horrible expression in her eyes and on her face. She looked as though she was scared to death, not drowned."

OWNER RESPONSIBILITIES

The investment in safety must be accepted as an integral part of any existing or proposed dam, and not an extra item that can be eliminated if the budget is tight. This concept of safety applies throughout all phases of the project, from planning through design and construction, and most importantly throughout the life of the structure. A typical dam is not constructed to last indefinitely. As dams age they typically require increased efforts to operate and maintain them.

JOHNSTOWN FLOOD OF MAY 31, 1889

The following personal accounts, described by observers and survivors of this tragic dam failure which killed 2,209 people, were selected from The Johnstown Flood of 1889, The Tragedy of the Conemaugh, by Paula and Carl Degen, Eastern Acorn Press, 1984.

"It came like a thief, and was upon us before we were aware. Already when it reached us it had numbered its victims by the hundreds. Mineral Point and East Conemaugh were gone, a passenger train was engulfed. Woodvale was swept away. Conemaugh Borough was shaved off as if by the sharp surface of an avalanche; in a moment Johnstown was tumbling all over itself; houses at one end nodded to houses at the other end and went like a swift, deceitful friend to meet, embrace, and crush them. Then on sped the wreck in a whirl, the angry water baffled for a moment, running up the hill with the town and the helpless multitude on its back, the flood shaking with rage, and dropping here and there a portion of its burden--crushing, grinding, pulverizing all. Then back with the great frame buildings, floating along like ocean steamers, upper decks crowded, hands clinging to every support that could be reached, and so on down to the great stone bridge, where the houses, piled mountain high, took fire, and burned with all the fury of hell you read about."

"Everything about us was in inextricable confusion, showing the effects of the terrific convulsion through which nature and humanity had passed. Here were uprooted trees, houses upturned or demolished, furniture of every description--hardware, woodenware, parlor ornaments and kitchen utensils, mattresses, bodies of horses, cattle and swine, corpses of men, women, and children, railroad cars and locomotives--overturned or on end, and pressing down upon the half-buried bodies of the drowned." [The Reverend David J. Beale]

"The flood showed no mercy: it struck down young and old, man, woman, and child. One of the saddest stories is that of the Fenn family. The flood claimed the father and seven children. If God had spared me one I could have been resigned. But all, all! Father in Heaven, is not my cross heavier than I can bear?"

"Death by violence due to the flood caused by the breaking of the dam of the South Fork Reservoir. We find the owners of said dam were culpable in not making it as secure as it should have been, especially in view of the fact that a population of many thousands were in the valley below; and we hold that the owners are responsible for the fearful loss of life and property resulting from the breaking of the dam. (The Cambria County coroner's inquest)."

OWNER LIABILITY

The dam owner is liable for the damages resulting from a dam's misoperation or failure that would result in a sudden release of water downstream. In assessing the legal liability for a dam failure, there are two basic theories that are used, strict liability and negligence.

Earth Dam Failure

Strict Liability

The theory of strict liability essentially imposes liability as a risk of doing business and is derived from the old English case of Rylands v. Fletcher. In this case, a dam and reservoir were constructed by the defendants on a parcel of property with the owner's permission. A shaft gave way and caused the impounded water to destroy the plaintiff's property. The court ruled for the plaintiff, holding that when one brings onto his land, and collects and keeps there anything likely to do mischief, if it escapes, and it is a non-natural use of the land, he must keep it at his peril. The rule is that a defendant is liable when he damages another by a thing or activity unduly dangerous, in light of the place and its surroundings.

The concept of strict liability has been extended widely to activities that are considered abnormally dangerous. The basis for this is the risk of harm and potential magnitude of that harm. Factors to be considered in strict liability include the degree of risk, the potential gravity of harm should the risk materialize, the exercise of reasonable care, whether or not the activity is one of common usage, the appropriateness of the activity to the locality, and its value to the community.

Negligence

The alternative theory of liability is one of negligence, which is the most commonly utilized cause of action in tort litigation. Negligence is generally defined in terms of failure to exercise the standard of care of a reasonable person under similar circumstances. This standard in turn is based on the reasonable foreseeability of the risk. It is important to emphasize that the ultimate question though is, whether in light of that forseeability, how a reasonable person would have acted taking into account the potential magnitude of harm and the alternatives available. Thus, negligence can consist of a failure to act, or the failure to act in a reasonable manner.

Keep Off!

In Maryland, the General Assembly has added statutory requirements on top of the common law strict liability and negligence doctrines. Construction and repair of dams require state permits and those permits contain specific conditions for maintenance. Size, location, design, and public safety are all

issues addressed by State law and regulations. The Administration may order structures built without permission to be drained or removed.

It is the owner's responsibility and obligation to act in a reasonable manner to inspect and maintain the dam and its appurtenances. Additionally, the Dam Safety Division of the Water Management Administration performs periodic safety inspections of Maryland dams. After each inspection, the owner is presented with a summary of findings and maintenance recommendations. These recommendations should be implemented to insure the dam's continuing safety.

Public Safety

In addition to the responsibility for dam maintenance, owners should also be aware of their responsibility for public safety. This includes the safety of people not authorized to use the facility. "No Trespassing" signs should be posted and fences and warning signs should be erected around dangerous areas. Liability insurance can also be purchased to protect the owner in the event of accidents.

In conclusion, dam owners have both the legal and moral obligation to keep their dam in repair. The following guidelines should be followed:

- Periodically monitor the condition of the dam and correct any deficiencies. Depending on the size of the structure and its operational history, this could mean anything from a occasional casual site inspection to a full scale annual evaluation by a professional engineer experienced in dam design.

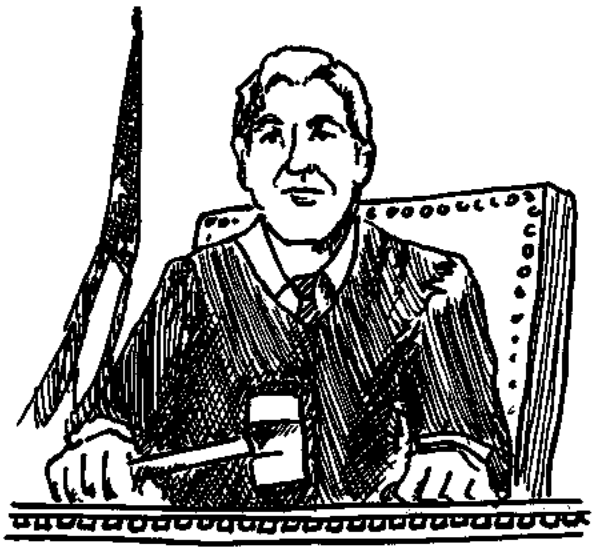
- When the dam is inspected by the State Dam Safety Division, recommendations should be carefully reviewed and repairs made shortly thereafter.

- If abnormal conditions develop at the dam, or the dam shows signs of potential failure, the owner must be prepared to notify local and state authorities so every action possible can be taken to protect lives and property downstream, as well as the dam itself.

Riparian Rights

Care should be taken by owners when releasing or impounding water to protect the rights of downstream property owners. The system of riparian rights has been established through the courts, and permits each riparian owner to make a "reasonable" use of the water, having regard to the same rights existing for the other downstream riparian owners.

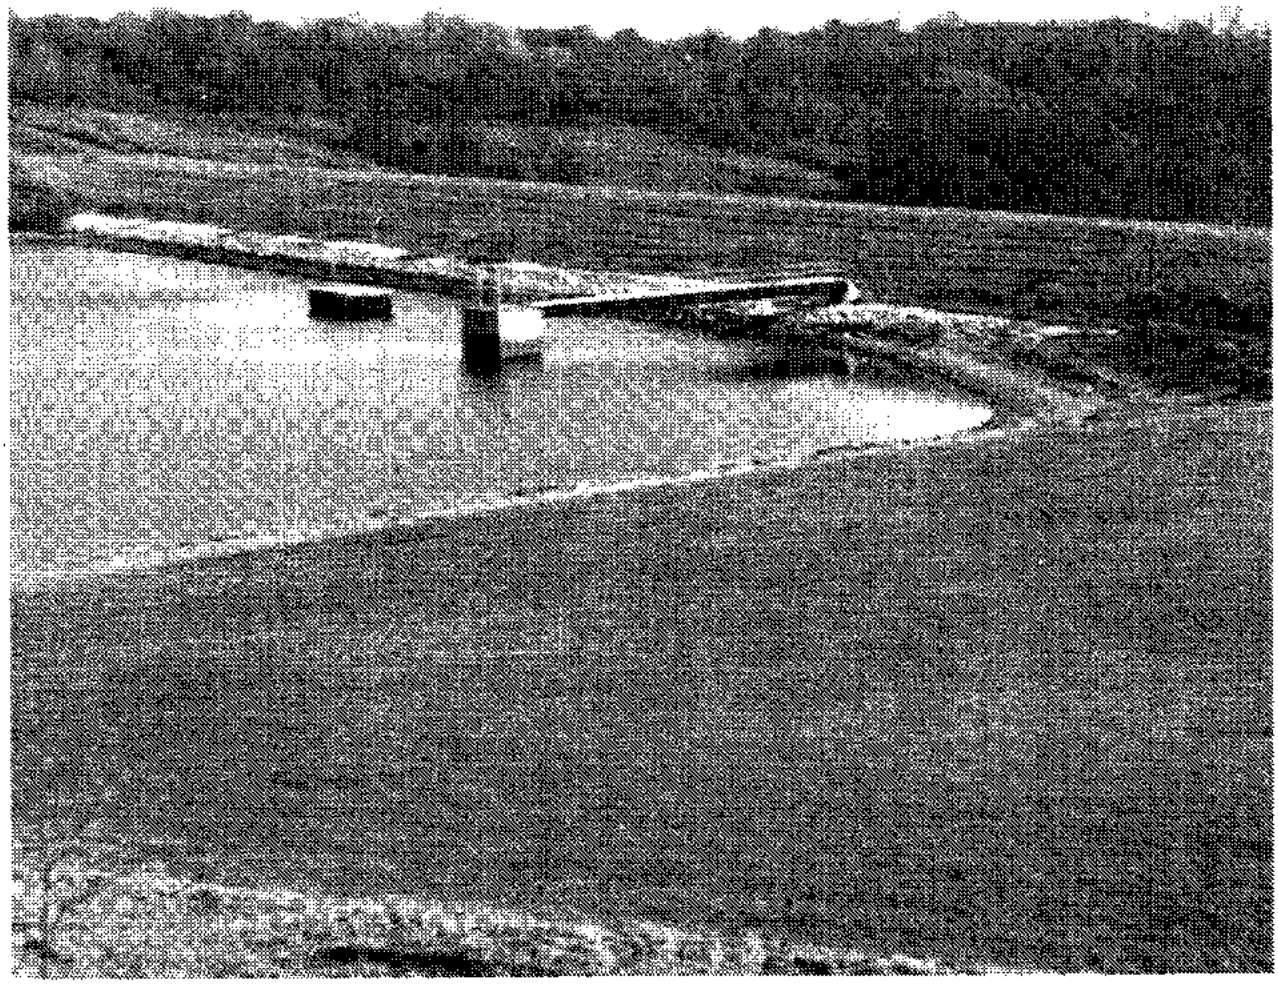
Professional Assistance



A dam with its associated works is a complex structure. Engineers who are experienced in the design, construction, and inspection of dams should be consulted for many of the operation guidelines and maintenance techniques identified in this manual.

The owner or operator of the dam should always keep in mind that each structure is unique in its construction and operation. When contacting a professional for assistance, there can be no substitute for the availability of historical records and documentation on the operation of the facility. Therefore, it is extremely important to follow the guidelines suggested in this manual.

Assistance in the form of technical advice and historical records is available from the Maryland Department of the Environment, Water Management Administration, Dam Safety Division, 1800 Washington Blvd., Suite 440, Baltimore, Maryland 21230-1718, Phone (410) 537-3538, Fax (410) 537-3553

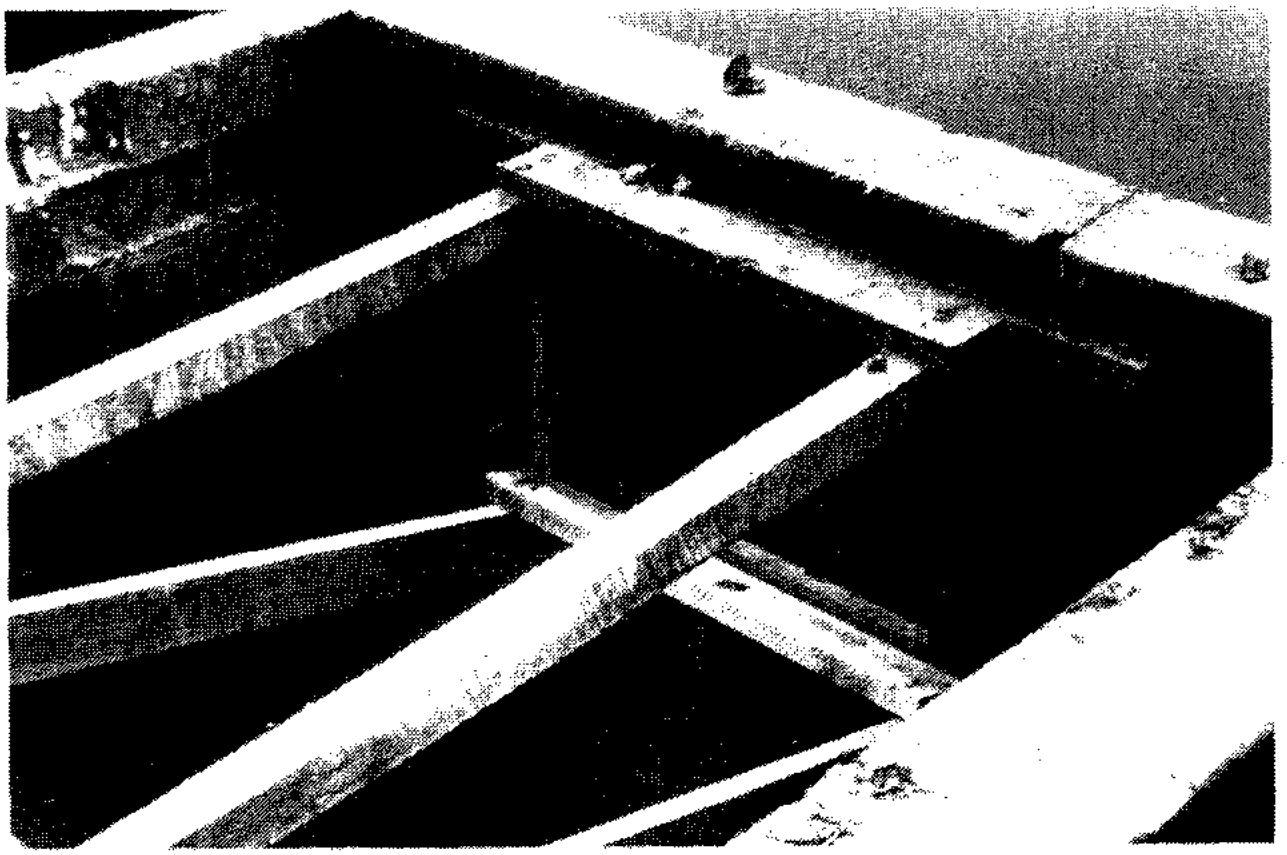


DAM SAFETY LAWS

Maryland laws and regulations place upon the dam owner the responsibility of constructing and maintaining a safe facility. These laws have been in existence since 1933 and are updated periodically in order to keep pace with changing engineering technology.

The Maryland Dam Safety Division issues permits to construct new dams or make major alterations to existing structures. The major emphasis of the administrative permit process is placed on the safety and longevity of the dam. In addition, the capabilities of the owner to operate and maintain the facility are also considered.

A chronology of the legislative history of Maryland's Dam Safety Program can be found in the Appendix. In addition, the most current Rules and Regulations governing the construction of dams are included to provide guidance to the dam owner.



UNAUTHORIZED CONSTRUCTION

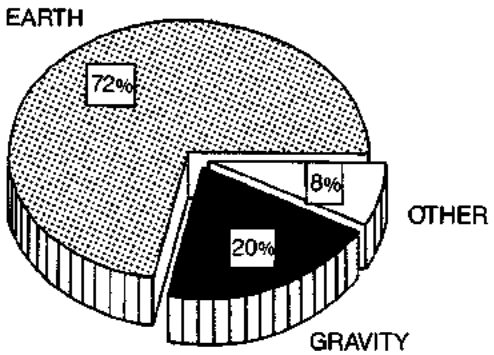
The modification of a dam or spillway without adequate engineering design and supervision could result in the spillway or dam being inadequate in capacity or function. This could lead to a costly repair or complete failure of the structure.

One of the more common errors made by dam owners is raising the normal pool elevation by permanently elevating the crest of the principal spillway. This action not only results in a decrease in storage available during a flood event, but also restricts the capacity of the spillway by reducing the total depth available to "push" water through the spillway. Raising the normal pool will usually cause the emergency spillway to flow more frequently than its design allows, thus increasing the overall maintenance cost. Furthermore, raising the normal pool without a state permit is a violation of Maryland dam safety laws.

It is important for the dam owner to realize that each part of the dam is equally important to the safety of the entire structure. Seemingly minor changes to the dam can cause misoperation or reduce the margin of safety that has been designed into the structure. For this reason, any proposed modifications to the dam require a state permit and should be discussed with the Dam Safety Division.

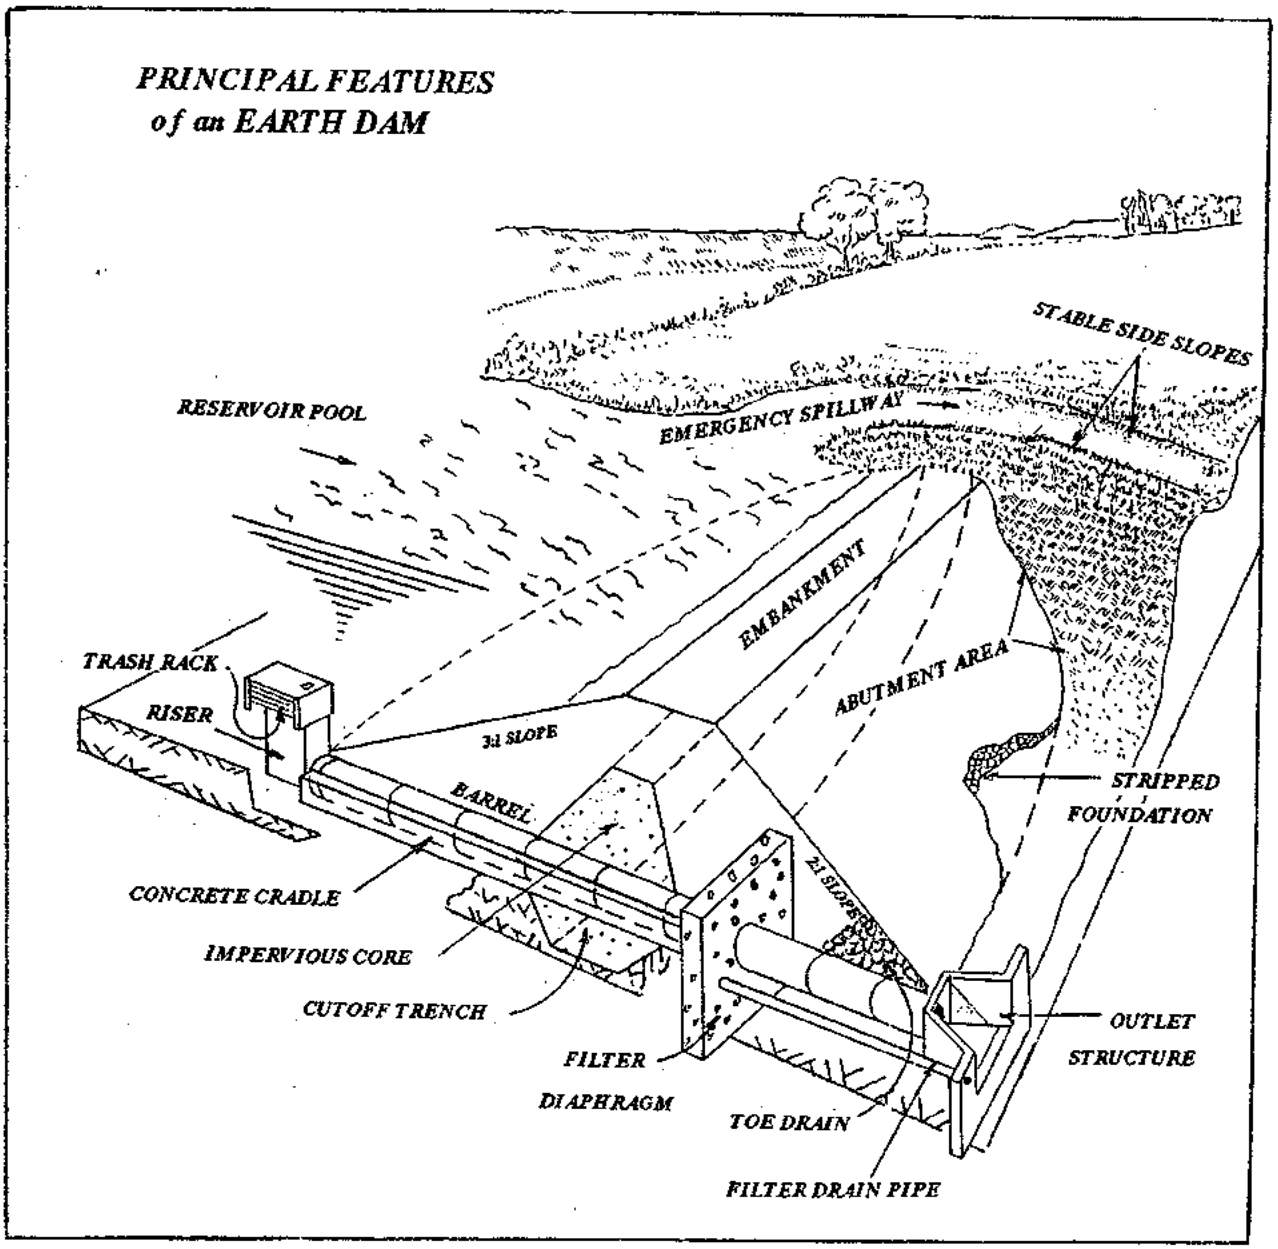
Unauthorized raising of the lake level with the addition of cinder blocks to this spillway structure. This modification resulted in the necessity to brace the spillway. If heavy rains were to occurr, the spillway would not be able to handle the incoming flows.

OPERATION



The types of dams discussed in this manual are normally used to store water for irrigation, water supply, recreation, and to provide stormwater management and flood control. Operation of these types of dams will rarely "push" water through the spillway. Raising the normal pool will usually cause the emergency spillway to flow more frequently than its design allows, thus increasing the overall maintenance cost. Furthermore, raising the normal pool without a state permit is a violation of Maryland dam safety laws.

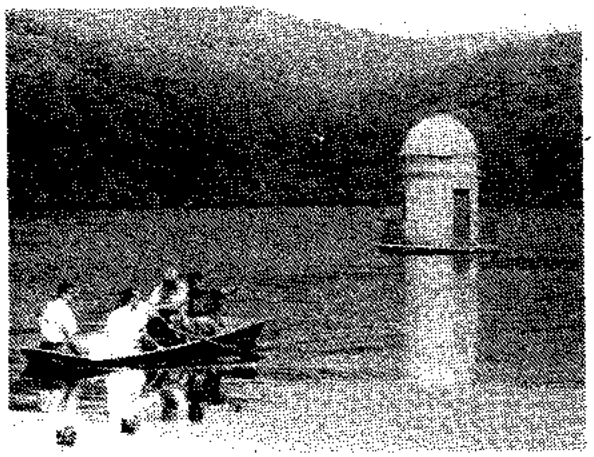
It is important for the dam owner to realize that each part of the dam is equally important to the safety of the entire structure. Seemingly minor changes to the dam can cause misoperation or reduce the margin of safety that has been designed into the structure. For this reason, any proposed modifications to the dam require a state permit and should be discussed with the Dam Safety Division.



COMMON DAM ELEMENTS

Dams can be constructed of various materials such as concrete, earth, rock, and wood. Many of the common dam types are listed in the glossary. In Maryland, the different types of dams are listed in the adjacent chart:

As one can see, the majority of dams are constructed of earth. Therefore, the primary focus of this manual will be toward this type of dam. The figure below illustrates the common elements of an earthen dam.



Maryland Dams By Type

OPERATION PLANS

The owner of each dam should adhere to a prescribed operation and maintenance program in order to insure the safety welfare of his investment. An effective operation program provides all of the necessary information for the owner to perform the tasks routinely required to operate and maintain the dam. The extent of the operation plan depends on the complexity of the dam itself. Regardless of the size of the structure there are many similarities between operation plans. The most effective plans are usually the simplest.

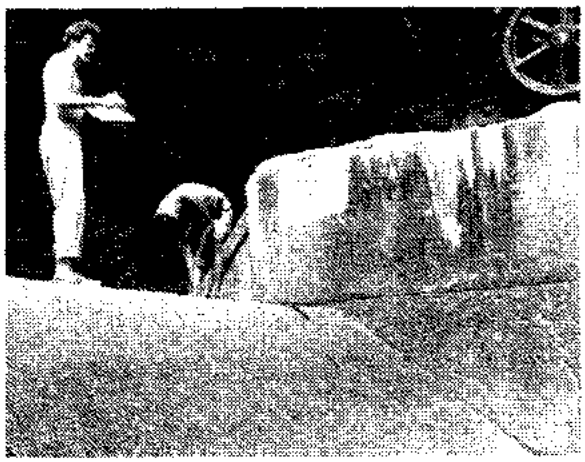
Site Inspection

The principal elements of an effective operation plan are presented below:

Background Data A typical dam owner possesses a good deal of information about his facility. Very often the information is scattered about or reviewed so rarely that it is of little use. This section of the operation plan serves to organize available background data to make it more accessible.

Schedule of Routine Tasks A schedule that includes both day-to-day tasks as well as tasks performed less frequently throughout a given year is important. The schedule serves to formalize inspection and maintenance procedures such that the owner could determine when a task is to be performed by merely consulting the schedule.

Emergency Procedures Perhaps the most important section contains a formal plan for reacting to dam emergencies. It involves coordination between the dam owner/operator, local agencies, and downstream residents.



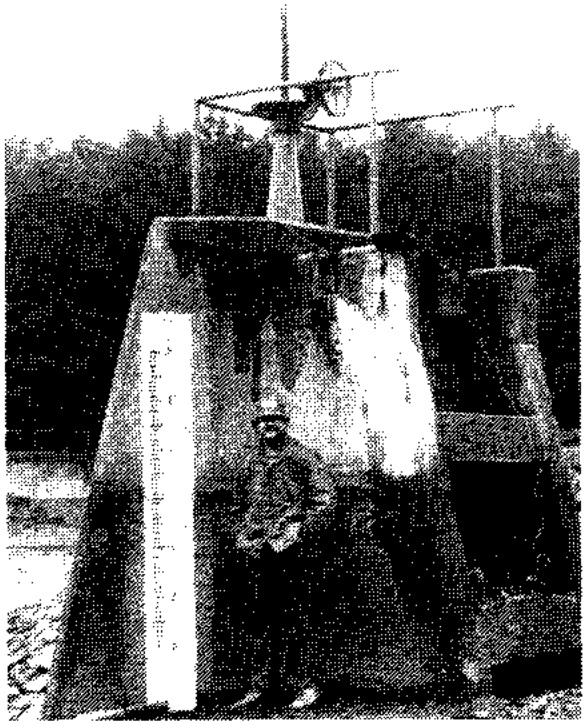
Record Keeping

The owner should maintain a complete and up-to-date set of plans and specifications ("as-built" drawings) for the dam, which should show all changes made over time. Knowing how a dam, its spillways, and other appurtenances were constructed or modified is very helpful in diagnosing problems.

Operation of a dam should include keeping accurate records of the following:

Observations: All observations should be recorded. Of particular importance is the periodic observation of existing seepage to detect any changes in flow. Photographs are valuable for recording observations and changes.

Maintenance: Written records of maintenance and major repairs will be important in periodic safety evaluations of the dam.



Record Keeping

Rainfall and Pool Levels: A record of the date, hour, and maximum elevation of extreme high water events and the associated rainfall is especially helpful in evaluating the performance of the dam and its spillway system. Rain gauges are

available at any local farm or garden store. Lake level staff gauges can be easily made, or measurement numbers can be painted on existing structures in the pool area.

Drawdown: A record should be kept of the amount, rate, and reason for pool level drawdown.

Other Operational Procedures: A complete listing of operational procedures should be maintained.

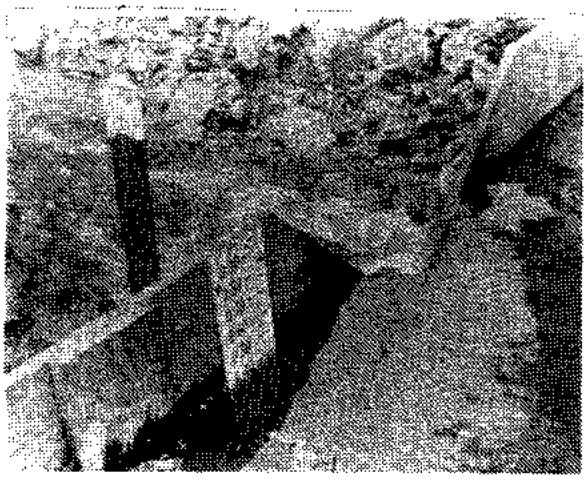
Reservoir Staff Gauge

General Instructions

The form on the following page is provided for the convenience of the dam owner or operator in keeping monthly records. This periodic monitoring program will help to develop a well documented history of the operation and performance of the facility. Guidelines in recording information are as follows:

Rainfall and Pool Level - Spaces have been provided for one month's records if daily readings are made. At a minimum, rainfall and pool level records should be kept of significant (very large) rainfall events. Weather conditions should include: rainfall duration and intensity estimates; temperature; ice and snow cover conditions; etc. General observations of the spillway performance and condition of the dam should be made.

Maintenance Performed - Maintenance and operation of equipment can be recorded under these headings. For example, if the lake drain is operated periodically, the date can be recorded here. Minor repairs, such as patching of spillway concrete or joints should also be recorded.



Flow Amounts - Records can be kept of any flows which are being periodically observed. Others could apply to seepage flow estimates of a certain area. Weather conditions during the observation are important to note.

OPERATION AND MAINTENANCE RECORDS

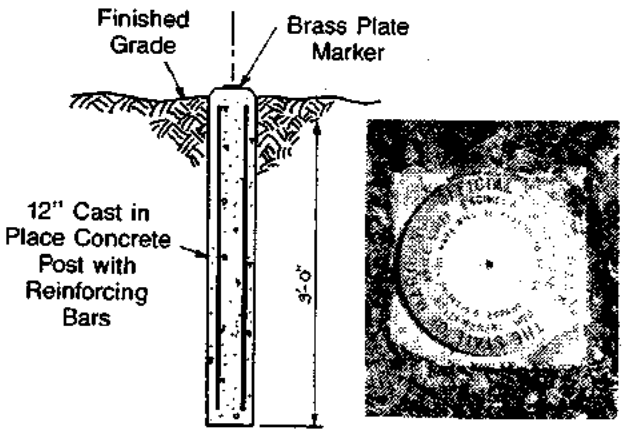
DATE	TIME	RAIN (inches)	POOL LEVEL	WEATHER CONDITIONS	GENERAL OBSERVATIONS OR COMMENTS	RECORDED BY

MONITORING DEVICES

Various devices such as weirs, piezometers, and settlement monuments are used to monitor earth embankments and concrete gravity structures. These devices can be used to determine if the structure is performing as designed, to detect signs of serious problems, or to provide further information after a problem has been detected. The use of extensive instrumentation is usually limited to large dams or those structures for which little design and construction documentation is available. A full-scale monitoring and instrumentation program requires professional design.

V-notch Weir for Seepage Monitoring

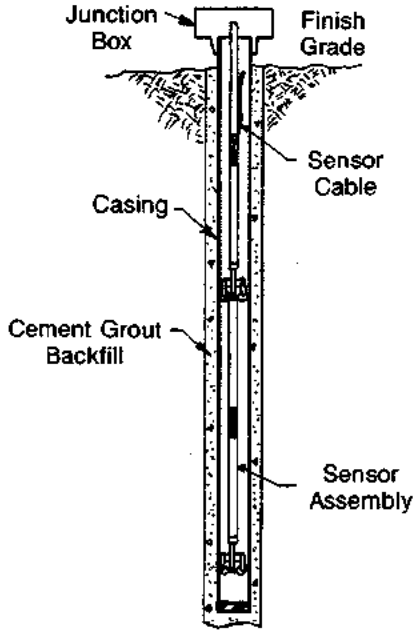
Monitoring by a private owner is usually limited to visual observation. It is very important that the observations be made periodically and accurately recorded. Several checklists for this purpose have been included in this manual. Owners are encouraged to use photographs with identifying dates and labels as a permanent record. These photos should be kept with the other dam records.



The following devices can easily be used by owners to monitor their embankments:

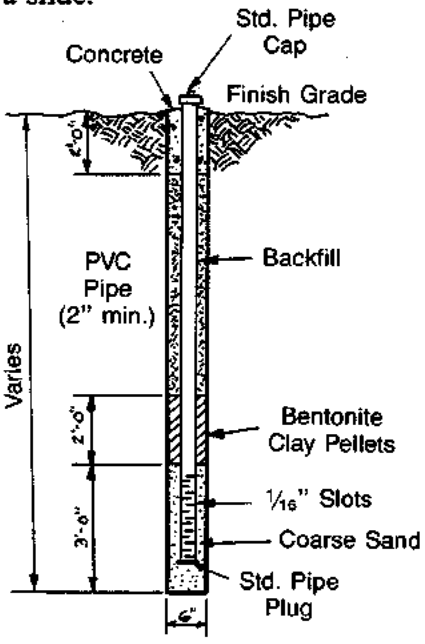
Weirs, Flumes, and Buckets Flow rates for weirs and flumes are obtained from a calibration chart that relates the depth of flow to gallons per minute of flow. The flow from pipe outlets can be measured by timing how long it takes to fill a bucket of known capacity. In order for the readings to be meaningful, they must be taken at regular intervals that are frequent enough to establish trends of seasonal variations in pool and groundwater levels as well as other factors that can affect the seepage rate. Many times after installation, weirs and flumes are neglected and good readings become useless for lack of comparative data. The v-notch weir is probably the most commonly used device to measure flow rates of seepage.

Yardstick or Folding Rule This portable monitoring device is not only inexpensive but has a number of uses. It can be used to measure cracks, scarps, erosion gullies, settlement, trees, wet areas, and slab or wall movement. Again, records should be kept of all observations for comparative purposes.



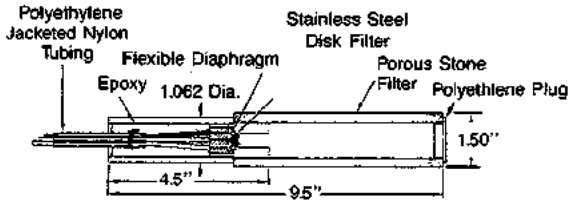
Camera Photographs which have been dated and labeled provide an excellent record of existing conditions, and if taken periodically from the same locations, can be used for comparison. Photographs should be taken during all inspections to supplement written and visual observations. They are valuable in documenting the location and severity of wet areas, erosion, and concrete deterioration.

Settlement monuments, piezometers, observation wells, and inclinometers are often found on large dams and are described briefly. Their installation requires professional assistance.



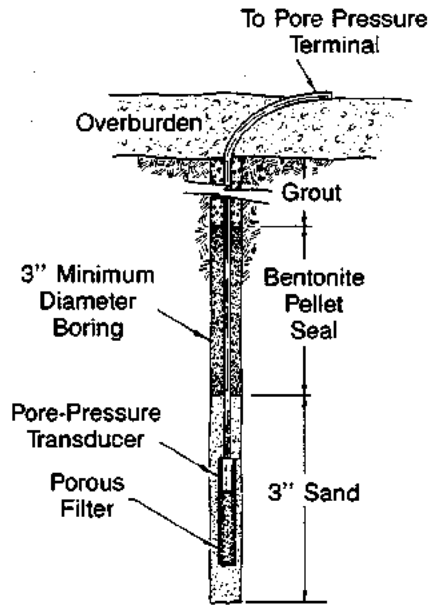
Survey Monument Detail

Settlement Monuments are usually installed along the crest of the dam to check its vertical and horizontal alignment (with known reference points and elevations). Measurements of these monuments must be precise and are obtained using surveying instruments.



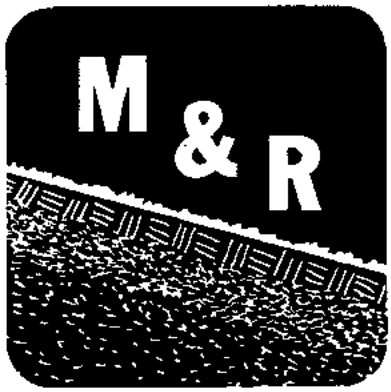
Slope Inclinometer

Inclinometers are instruments that are lowered into a vertical casing and measure horizontal deflection of the embankment. Inclinometers are often used to determine the rate of movement of a slide.



Open Pipe

Observation Wells (technically known as open standpipe piezometers) can be installed in the embankment and are used to determine the water levels. Measurements are made with a water level indicator that is lowered into the well.

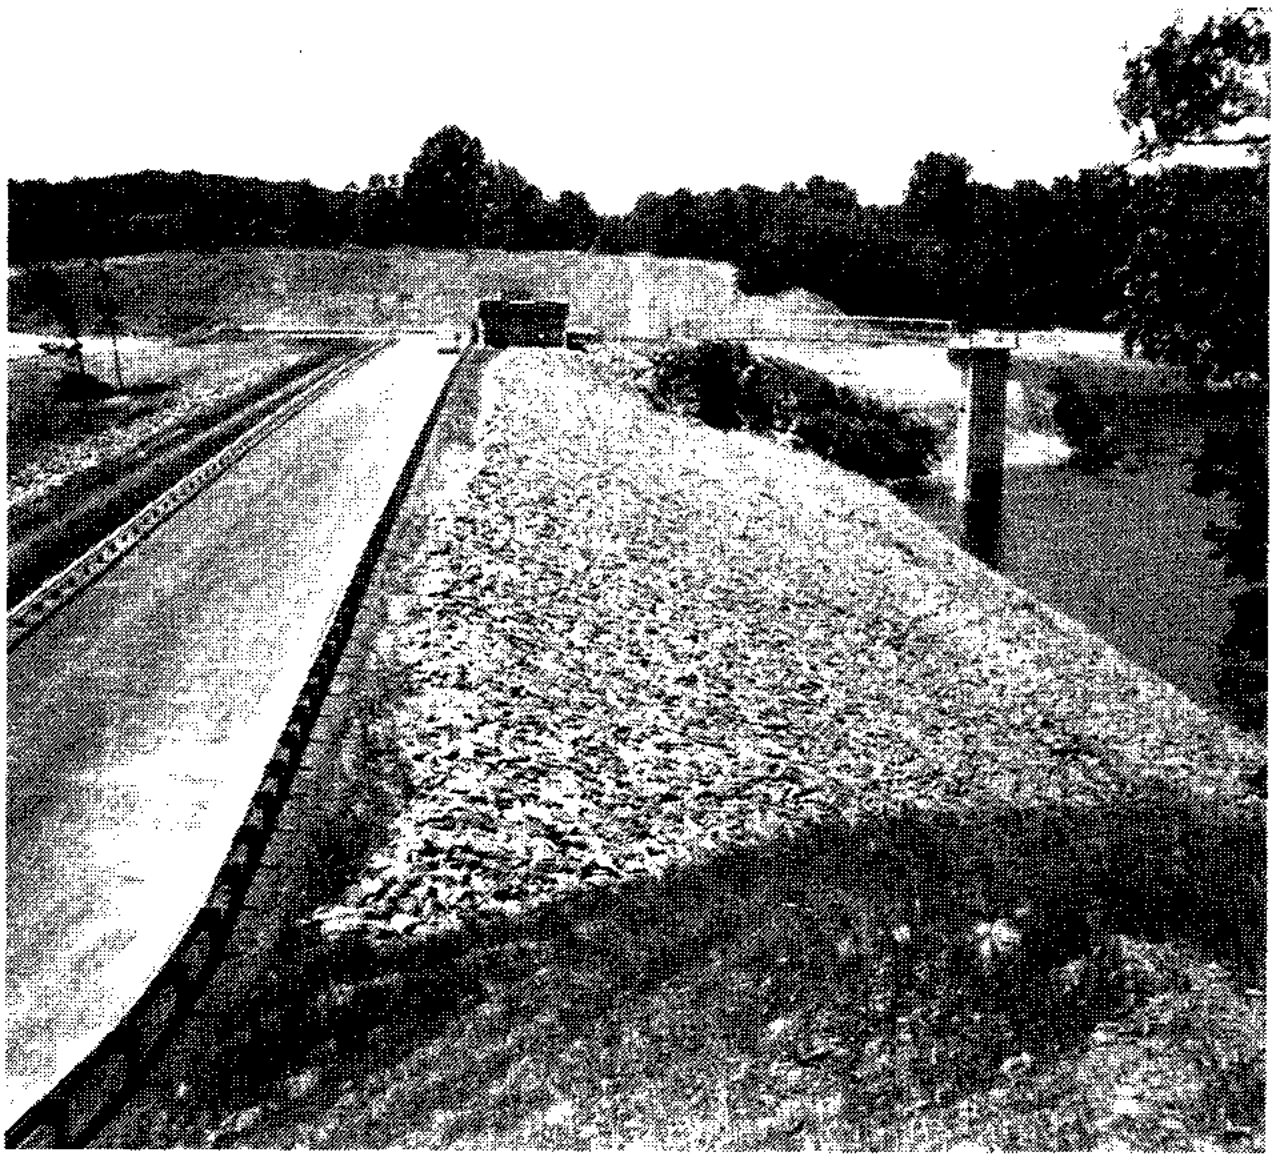


SINCO Pore-Pressure Transducer

Pneumatic Piezometers

Piezometers are instruments used to measure the water pressure in the embankment and foundation. Pore pressure within the embankment can be determined from these readings.

MAINTENANCE AND REPAIR



The importance of proper dam maintenance cannot be overemphasized. A regular program of inspection and care will help to keep many major problems from developing and avoid more costly repairs at a later date. The Water Management Administration requires all dam owners to maintain their facility in a safe condition so that it may not endanger human life or property located above or below the facility. Routine maintenance is defined as minor maintenance that does not modify the original design parameters of the facility. The Water Resources Administration requires the issuance of a Maintenance and Repair Permit for any repairs or maintenance that involves the modification of the dam or spillway from its original design and specifications. A permit is also required for any repairs or reconstruction that involve a substantial portion of the structure.

In general, maintenance items are required for the following major areas:

EMBANKMENT
SPILLWAY AND OUTLET WORKS
RESERVOIR

EMBANKMENT

The embankment section of the dam is usually constructed of earth or rock. Embankment dams are built with different design sections. Internal zoning of material ranges from simple to intricate. Practical experience suggests that embankment slopes should be easily maintainable while providing an adequate factor of safety against failure. Because the embankment is the main feature of the dam, the owner should provide for routine maintenance of the slopes and crest.

VEGETATION

The establishment and control of proper vegetation is an important part of dam maintenance. Properly maintained vegetation can help prevent erosion of embankment and earth channel surfaces. Proper maintenance also ensures a healthy stand of vegetation that can withstand extreme climatic conditions and pest, weed, or disease infestation better than poorly maintained vegetation. The uncontrolled growth of vegetation will damage embankments and concrete structures and make close inspection of the dam difficult. Aesthetics, unobstructed viewing during inspections, maintenance of a nonerodible surface, and discouragement of burrowing animal habitation are reasons for proper maintenance of the vegetative cover.

NO TREES ALLOWED!

Ground Covers

Grass is the most common type of vegetation found on an embankment. Grass is an effective and inexpensive way to prevent erosion of embankment surfaces. If properly maintained, it also enhances the appearance of the dam and provides a surface that can be easily inspected. Roots and stems tend to trap fine sand and soil particles, forming an erosion-resistant layer once the sod is well established. Grass vegetation is least effective in areas of concentrated runoff, such as the contact of the embankment and abutments, or in areas subjected to wave action. In these areas a riprap channel is recommended.

Types of vegetation that have been used on dams in Maryland are tall fescue, red fescue, clover, redtop, and sericea lespedeza. Deep rooted grasses should be planted in vegetated earth spillways. One hundred percent Kentucky 31 Fescue is excellent for erosion protection. Seeding should be accomplished between optimum planting dates. Seeding late in the year may result in winterkill of young seedings. The following spring an inspection of the seeded area should be made to determine if plant survival is satisfactory.

Before seeding, fertilizer and lime should be applied. Exact quantities necessary will vary with soil type and condition, and can be determined by having the soil tested. The fertilizer and lime should be raked, disced, or harrowed into the soil to a depth of not less than 4 inches. Periodic fertilization is necessary to maintain vigorous vegetation. Immediately following seeding, the area should be mulched. Mulching materials should be kept in place with a mulchanchoring device or with asphalt emulsion.

Additional information on the proper selection of grasses and legume mixtures, seeding rates, optimum planting dates, and vegetation maintenance is available in the "Maryland Standards and Specifications for Sediment and Erosion Control."

Trees and Brush

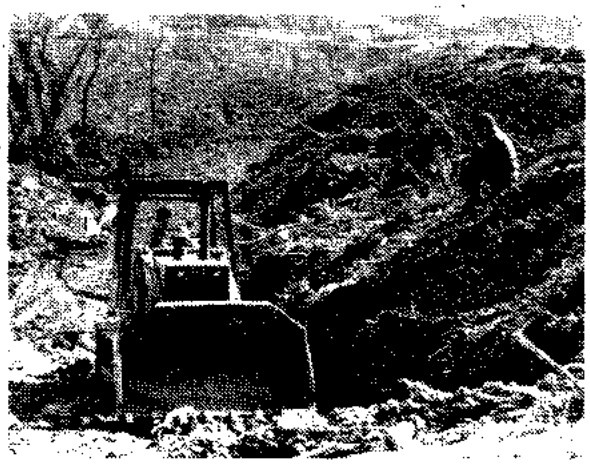
The presence of trees and brush is the most common form of neglect in the area of embankment maintenance. Uninformed owners will often allow trees and brush on their dams. **Woody vegetation is, however, one of the dam's worst enemies, and will lead to more serious maintenance problems if not controlled.**

Trees and brush should not be permitted on embankment surfaces or in vegetated earth spillways. Extensive root systems can provide seepage paths for water. Trees that blow down or fall over can leave large holes in the embankment surface that will weaken the embankment and can lead to increased erosion. Brush obscures the surface and limits visual inspection, provides a haven for

inspection, provides a haven for burrowing animals, and retards growth of grass vegetation. Tree and brush growth adjacent to concrete walls and structures may eventually cause damage and should be removed.

Failure Due to Root System

Trees that have been allowed to grow on the dam should be removed so desirable vegetation can be established and the surface can be mowed. The stumps can be removed either by pulling or with machines that grind them down. For trees greater than eight inches in diameter, all woody material should be removed to about 24 inches below the ground surface. The cavity should be filled with well compacted soil and grass vegetation established.



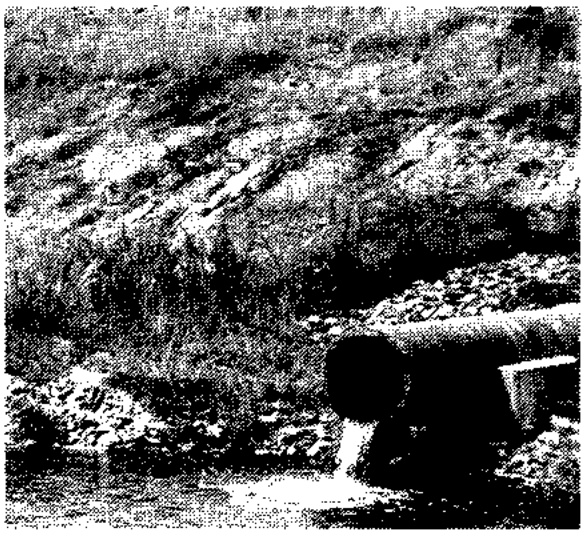
Stumps less than eight inches in diameter may be left in place if cut flush with the ground and treated with a silvicide.

Stumps of trees in riprap cannot easily be removed, but should be chemically treated so they will not continually form new sprouts. The removal of large trees and stumps is expensive and usually requires the use of heavy construction equipment.

Mowing and Brush Removal

Embankments, areas adjacent to spillway structures, vegetated channels, and other areas associated with a dam require periodic maintenance of the vegetative cover. Grass mowing, brush cutting, and removal of woody vegetation (including trees) is necessary for the proper maintenance of a dam. All embankment slopes and vegetated earth spillways should be mowed or trimmed at least once a year. Brush removal is also important beyond the downstream toe of the dam in order to allow inspection for "boils" (see Seepage).

Methods used in the past for control of vegetation that now may be considered unacceptable include chemical spraying and burning. More acceptable methods include the use of weed whips, power brush-cutters and mowers. It is important to remember to use the proper equipment for the slope and type of vegetation to be cut, and to always follow the manufacturer's recommended safe operation procedures.



Tree/Stump Removal

Mowing Embankment With Special Equipment

EROSION

Whether on a slope or at a spillway outlet, erosion is a common maintenance problem on the embankment structure. Erosion is a natural process and its continuous forces will eventually wear down almost any surface. The rate of erosion is directly related to the lack of vegetation. Periodic and timely maintenance is essential in preventing continuous deterioration, more costly repairs at a later date, and possible failure of the dam.

Embankment Erosion

Vegetated Surfaces

A sturdy sod, free of weeds and brush, is one of the most effective means of erosion protection. Embankment slopes are normally designed and constructed so that the surface drainage will be spread out in thin layers as "sheet flow" on the grassy cover. When the sod is in poor condition or flows are concentrated at one or more locations, the resulting erosion will leave rills and gullies in the embankment slope. The owner should look for these areas and be aware of the problems that may develop.

Prompt repair of eroded areas is required to prevent more serious damage to the embankment. Rills and gullies should be filled with suitable soil (the upper 4 inches should be topsoil, if available), compacted, and then seeded. Methods described in the section on vegetation should be used to properly establish the grassed surface. Erosion in large gullies can be slowed by stacking bales of hay or straw across the gully until permanent repairs can be made.

Erosion Left Unattended

Repairs of the eroded areas should also address the cause of the erosion in order to prevent a continuing maintenance problem. Erosion may be aggravated by improper drainage, settlement, pedestrian traffic, animal burrows, or other factors. The cause of the erosion will have a direct bearing on the type of repair needed.

Paths from pedestrian traffic are problems common to many embankments. If a path has become established, vegetation in this area will not provide adequate protection and more durable cover will be required unless the traffic is eliminated. Small stones, asphalt, or concrete have been used effectively to cover footpaths. Embedding railroad ties or other treated wood beams into an embankment slope to form steps is one of the most successful and inexpensive methods used to provide a protected pathway.

Worn areas also result from unwanted two and four-wheel vehicle traffic. Control of these vehicles is discussed in the section on vandalism.

Another area where erosion commonly occurs is the contact between the embankment and the concrete walls of the spillway or other structures. Poor compaction adjacent to the

wall during construction and subsequent settlement could leave an area lower than the grade of the embankment. Runoff often concentrates along these structures, resulting in erosion. Possible solutions include regrading the area to slope away from the wall, adding more resistant surface protection, or constructing wood beam steps.

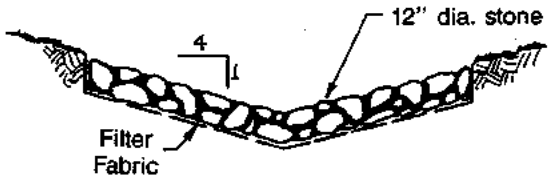
Pedestrian Path Erosion

Abutment Contacts

Adequate erosion protection is required along the contact between the downstream face of the embankment and the abutments. Runoff from rainfall concentrates in these gutter areas and can reach erosive velocities because of the steep slopes. Berms on the downstream face that collect surface water and empty into these gutters add to the runoff volume. Sod gutters may not adequately prevent erosion in these areas. A well graded mixture of rock with stones that are 9 to 12 inches in diameter, or larger, placed on a stone filter or filter fabric provides the best protection on small dams.

Paved concrete gutters do not hold up well, will not slow the velocity of the water, can become undermined, and therefore are not recommended. Groundhogs often construct burrows underneath these gutters, possibly since burrowing is easier due to existing undermining.

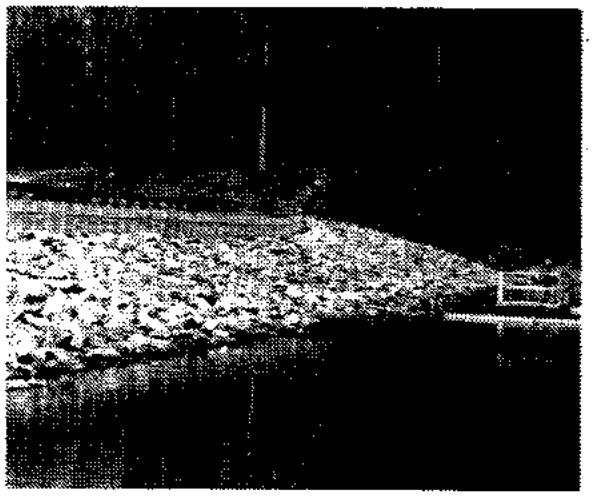
Erosion adjacent to gutters results from improper construction or design where the finished flow line of the gutter is too high with respect to adjacent ground. This condition prevents all or much of the runoff water from entering the gutter. The flow concentrates alongside the gutter, erodes a gully, and may eventually undermine the gutter.



Care should be taken when replacing failed gutters or designing new gutters to assure that:

1. The channel has adequate capacity,
2. Adequate protection and a satisfactory filter have been provided,
3. Surface runoff can enter the gutter, and
4. The outlet is adequately protected from erosion.

Riprap Gutter Construction



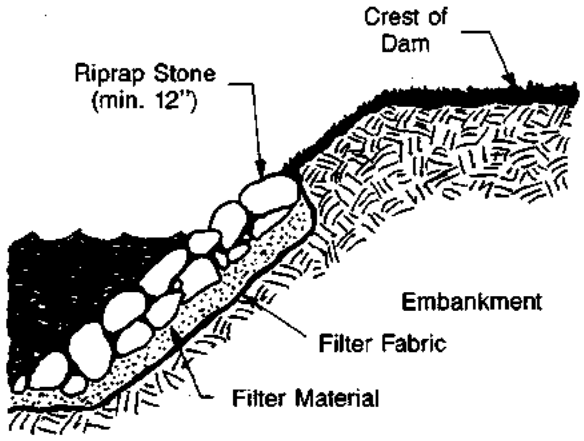
Riprap Ditch Detail

SLOPE PROTECTION

The upstream face of a dam is commonly protected against wave erosion by placement of a layer of rock riprap over a layer of filter material. This provides a surface on which the wave energy can dissipate.

Riprap should consist of a heterogeneous mixture of irregular shapes placed over a filter material. The maximum rock size and weight must be large enough to break up the energy of the anticipated wave action and hold the smaller stones in place. Generally, the largest stones should be at least 12 inches in diameter. The smaller rocks help to fill the spaces (or voids) between the rocks in the riprap. If the filter material can be washed out through these voids two filter layers will be required. The lower layer should be composed of sand or filter fabric to protect the soil surface. The second layer should be composed of coarser materials that prevent washout through the voids in the riprap.

A dam owner should expect some deterioration (weathering) of riprap. Freezing and thawing, wetting and drying, abrasive wave action, and other natural processes will eventually break down the riprap. The useful life of riprap varies with the characteristics of the stone used. Stone for riprap should be rock that is dense and well cemented.

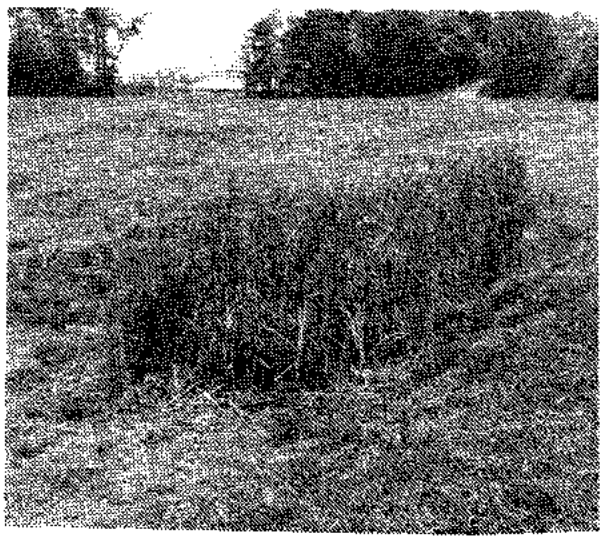


Properly Installed Protection

Another erosion problem which can develop on the upstream slope of the dam is "beaching." Waves caused by winds or power boats can erode the exposed face of the embankment. This action displaces the soil material farther down the slope, creating a "beach". Effective slope protection must prevent the soil particles from being removed from the embankment.

When beaching develops on the upstream slope of a dam, repairs should be made as soon as possible. The pool level should be lowered and the surface of the dam prepared for replacement of the slope protection. A small berm or "bench" should be made across the face of the dam to help hold the protective layer in place. The bench should be placed at the base of the new layer of protection. Depth of the bench will depend on the thickness of the protective layer. The layer should extend a minimum of 3 feet below the lowest anticipated pool level. Otherwise, wave action during periods when the lake level is drawn down can undermine and destroy the protective layer.

Sufficient maintenance funds should be allocated for the regular replacement of riprap. When riprap breaks down, erosion and beaching will occur more often than once every three to five years, professional advice should be sought to design more effective slope protection.

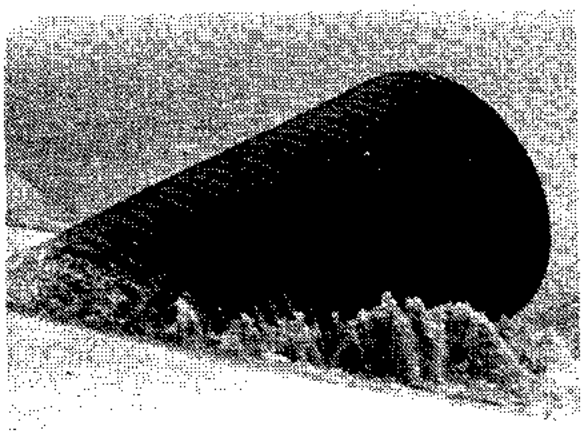


Slope Protection Detail

SEEPAGE

Contrary to popular opinion, wet areas downstream from dams are not usually natural springs but seepage areas. Even if natural springs exist in the area, they should be treated with suspicion and carefully observed. Flows from groundwater springs in existence prior to the reservoir usually increase in flow due to the pressure caused by a pool of water behind the dam.

All dams have some seepage as the impounded water seeks paths of least resistance through the dam and its foundation. However, seepage must be controlled in both velocity and quantity to minimize damage to the structure.



Evidence of Seepage

Detection

Seepage can emerge anywhere on the downstream face, beyond the toe, or on the downstream abutments at elevations below normal pool. Seepage may vary in appearance from a "soft," wet area to a flowing "spring." It may show up first as an area where the vegetation is more lush and darker green. Cattails, reeds, mosses, and other marsh vegetation often become established in a seepage area. In the winter, seepage areas may be evidenced by areas of ice buildup or areas of melted snow on the embankment. Downstream abutment contact areas should always be inspected closely for signs of seepage. Seepage can also occur along the contact between the embankment and a conduit spillway, drain, or other appurtenance. Slides on the embankment may be the result of seepage causing soil saturation or pressures in the soil pores.

At most dams, some water will seep from the reservoir through the foundation. Where it is not intercepted by a subsurface drain, the seepage will emerge downstream from or at the toe of the embankment. If the seepage forces are large enough, soil will be eroded from the foundation and be deposited in the shape of a cone around the seepage outlet. If these "boils" appear, professional advice should be sought immediately. Seepage flow which is muddy and carrying soil particles is evidence of "piping," and complete failure could occur within hours.

Piping Along Spillway Conduit

Piping can occur along a spillway and other conduits through the embankment, and these areas should be closely inspected. Sinkholes that develop on the embankment are signs that piping has begun, and may soon be followed by a failure of the dam. Emergency procedures, including downstream evacuation, must be implemented if this condition is noted. (See section on Emergency Procedures.)

A continuous or sudden drop in the normal lake level may be an indication that seepage is occurring. In this case, one or more locations of flowing water are usually noted downstream from the dam. This condition in itself may not be a serious problem, but will require frequent and close monitoring and professional assistance.

Control

The need for seepage control will depend on the quantity, content, and location of seepage. Controlling the quantity of seepage that occurs after construction is difficult, quite expensive, and not usually attempted unless the seepage is endangering the embankment or appurtenant structures. Typical methods used to control the quantity of seepage are installation of an upstream blanket, or the installation of relief wells or drainage trenches and drains. **All of these methods must be designed and constructed under the supervision of a professional engineer experienced with dams and require a state permit.**

Toe Drain Installation

Preventing loss of soil particles by seepage is extremely important. Modern design practice incorporates this control into the embankment through the use of cutoffs, internal filters, and adequate drainage provisions. Control of seepage at the downstream toe can be accomplished by using properly graded filters and providing proper drainage. The filter and drainage system should be designed to prevent migration of soil particles and still provide for passage of the seepage flow.

The location of a seepage or wet area on the embankment or abutment is often a primary concern. Excessive seepage pressure or soil saturation can threaten the stability of the downstream slope of the dam or the abutments. Seepage control can sometimes be accomplished by installing trench drains.

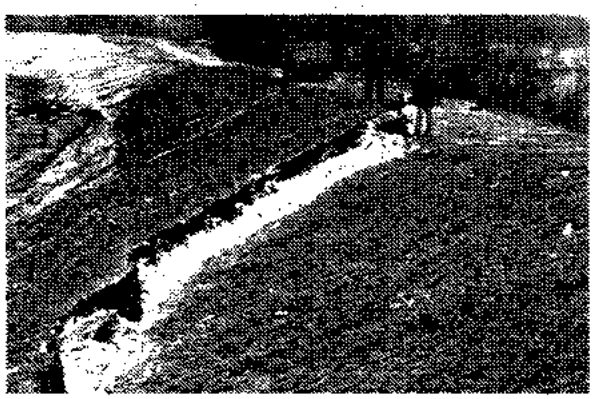
Monitoring

Regular monitoring is essential to detect seepage and prevent failure. Without knowledge of the dam's history, the owner has no idea whether the seepage condition is in a steady state (constant) or fluctuating condition. It is important to keep written records of points of seepage, quantity of flow, soil particle content, size of wet area, and type of vegetation for later comparison. The rate and content of flow emerging from these outlets should be monitored regularly and recorded. Photographs provide valuable records of seepage. The owner should always look for increases in flow and evidence of flow carrying soil particles.

Monitoring Internal Drain Seepage

Regular surveillance and maintenance of internal embankment and foundation drainage outlets is also recommended. Normal maintenance consists of removing any soil or other material that obstructs flow. Internal repair is complicated and often impractical and should not be attempted without professional advice.

STABILITY



The embankment must safely contain the reservoir. Cracks, slides, sloughing, and settlement are signs of embankment distress and should indicate to the owner that maintenance or remedial work is required. The cause of the distress must be determined by an experienced engineer before undertaking repairs. This step is important because poorly conceived repairs may cause greater and more serious damage to the embankment and can cause failure of the dam.

Cracks

The entire embankment must be closely inspected for cracks. Short, isolated cracks are not usually significant, but larger well-defined cracks indicate a serious problem. There are two types of cracks that occur on the embankment surface - transverse and longitudinal.

Transverse cracks appear perpendicular to the dam axis and indicate differential settlement within the embankment. Such cracks provide avenues for seepage and the piping of embankment material could develop quickly.

Longitudinal cracks run parallel to the dam axis and may signal the early stages of a slide or slump on either face of the embankment. In recently built structures, these cracks may indicate inadequate compaction of the embankment or inadequate foundation preparation during construction.

Transverse Crack

Small cracks, as they appear, should be documented, immediately examined by a professional engineer or the Dam Safety Division, and then sealed. The seal will prevent surface water from entering the cracks and causing saturation of embankment material. Saturation could possibly trigger a slide or other serious problems.

Sealing can be accomplished by compacting clay in the cracks. After the cracks have been sealed, the areas should be monitored frequently to determine if movement is still occurring. Slides or crack locations can be documented with photographs and sketches or diagrams. Continued movement is an indication of a more serious problem such as a slide.

Slides

Slides and slumps are serious threats to the safety of a dam and can initiate catastrophic failure. The need for immediate professional assistance to determine the cause of cracks and slides and to recommend remedial action cannot be overemphasized.

Slides can be detected easily unless obscured by tall vegetation. Arc-shaped cracks are indications that a slide or slump is beginning. These cracks can develop into a large scarp in the slope at the top of the slide.

Slide Failure

If a slide develops, the reservoir should be drained. The scarp should be sealed to prevent rainfall and surface runoff from lubricating the interior slide surface, saturating the embankment, and causing future sliding. Sealing the scarp is only a temporary measure and should include contacting the Dam Safety Division.

Slide material in spillway and outlet areas should be removed immediately since its presence reduces the flow capacity. Shallow surface slides can be repaired by removing the slide material and rebuilding the slope to original grade with well compacted pervious material. The cause for any slide should be fully determined before permanent repairs are made to the slope.

Settlement

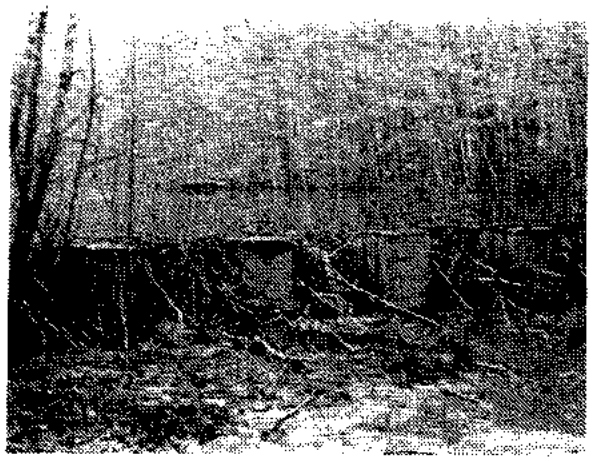
Settlement occurs both during construction and after the embankment has been completed and placed in service. To a certain degree, this is normal and should be expected. It is usually most pronounced at locations of maximum foundation depth or embankment height. Excessive settlement will reduce the freeboard (the difference in elevation between the water surface and the top of the dam) and may increase the probability of overtopping during a flood.

Excessive Settlement

Any areas of excessive settlement should be restored to original design elevations to reduce the risk of overtopping. A relatively large amount of settlement within a small area could indicate serious problems in the foundation or perhaps in the lower part of the embankment. Settlement accompanied by cracking often precedes failure. When either condition is observed, professional advice should be sought immediately. Settlement can be monitored by measuring the differences in elevation between the problem area and permanent reference monuments located away from the dam. Land surveying instruments are required to make these measurements.

Repair

Soil added to restore an embankment must be properly "keyed" into the base material. This is accomplished by removing the vegetation and all unsuitable material until a good firm base of undisturbed soil is uncovered. Unsuitable materials include wet, soft, porous, organic, and improperly compacted soils. The surface should then be roughened with a disc or similar device to obtain a good bond between "old" and "new" materials. The new soil should be successively placed in thin layers (6 to 8 inches thick) and each layer compacted before adding more material. Filters and drains may also be necessary to correct stability problems.



Repair of cracks, slides, and settlement is not considered routine maintenance and must be done under the supervision of a registered engineer who is experienced in the design and repair of dams. A permit must also be obtained from the Water Management Administration's Dam Safety Division.

RODENT CONTROL

Rodents such as the beaver, groundhog, and muskrat are attracted to dams and reservoirs, and can be quite dangerous to the structural integrity and performance of the embankment and spillway. Groundhog and muskrat burrows weaken the embankment and can serve as pathways for seepage. Beavers may plug the spillway and raise the pool level. Rodent control is essential in preserving a well maintained dam.

Beaver

Beavers will try to plug spillways with their cuttings. Routinely removing the cuttings is one way to alleviate the problem. Another successful remedy is the placement of electrically charged wires around the spillway inlet. Trapping beaver may be done by the owner during the appropriate season.

Beaver Dam Blockage in Spillway

Groundhog

Occupied groundhog burrows are easily recognized in the spring due to the groundhog's habit of keeping them "cleaned out." Fresh dirt is generally found at the mouth of active burrows. Half-round mounds, paths leading from the den to nearby fields, and clawed or girdled trees and shrubs also help identify inhabited burrows and dens.

When burrowing into an embankment, groundhogs stay above the phreatic surface (upper surface of seepage or saturation) to stay dry. The burrow is rarely a single tunnel. It is usually forked, with more than one entrance and with several side passages or rooms from 1 to 2 feet long.

Groundhog Control

Control methods should be implemented during early spring when active burrows are easy to find, young groundhogs have not scattered, and there is less likelihood of damage to other wildlife. In later summer, fall, and winter, game animals will scurry into groundhog burrows for brief protection and may even take up permanent nesting during the period of groundhog hibernation.

Groundhogs can be controlled by using fumigants or by shooting. Fumigation is the most practical method of controlling groundhogs. Around buildings or other high fire hazard areas, shooting may be preferable. Groundhogs will be discouraged from inhabiting the embankment if the vegetation cover is properly maintained.

Muskrat

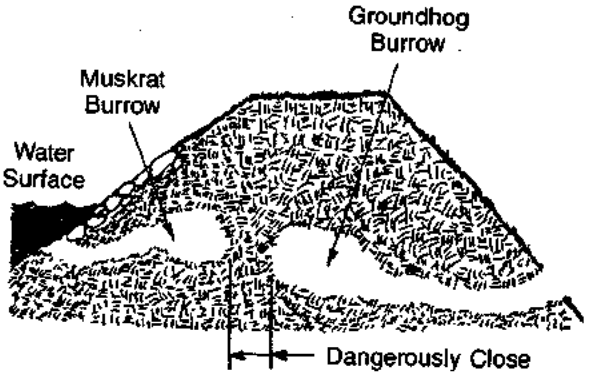
Muskrats can be found wherever there are marshes, swamps, ponds, lakes, and streams having calm or very slowly moving water with vegetation in the water and along the banks. Muskrats make their homes by burrowing into the banks of lakes and streams or by building "houses" of rushes and other plants. Their burrows begin from 6 to 18 inches below the water surface and penetrate the embankment on an upwards slant. At distances up to 15 feet from the entrance, a dry chamber is hollowed out above the water level. Once a muskrat den is occupied, a rise in the water level will cause the muskrat to dig higher to excavate a new dry chamber in the embankment. Damage (and the potential for problems) is compounded where groundhogs or other burrowing animals construct their dens on the opposite side of the embankment.

Muskrat Control

Barriers to prevent burrowing offer the most practical protection to earth structures. A properly constructed riprap and filter layer may discourage burrowing. The filter and riprap should extend at least 3 feet below the water line. As the muskrat attempts to construct a burrow, the sand and gravel of the filter layer cave in and thus discourage den building. Heavy wire fencing laid flat against the slope and extending above and below the waterline can also be effective. Eliminating or reducing aquatic vegetation along the shoreline will discourage muskrat habitation.

Eliminating a Burrow

A method of backfilling a burrow on an embankment is "mudpacking." Lowering of the reservoir pool level may be necessary to accomplish this work. This simple, inexpensive method can be accomplished by placing one or two lengths of metal stove or vent pipe in a vertical position over the entrance of the den. After making sure that the pipe connection to the den does not leak, the mudpack mixture is then poured into the pipe until the burrow and pipe are filled with the mixture. The pipe is removed and dry earth is tamped into the entrance. The mudpack is made by adding water to a 90 percent earth and 10 percent cement mixture until slurry or thin cement consistency is attained. All entrances should be plugged with well compacted earth, and vegetation reestablished. Dens should be eliminated without delay because damage from just one hole can lead to failure of the dam.

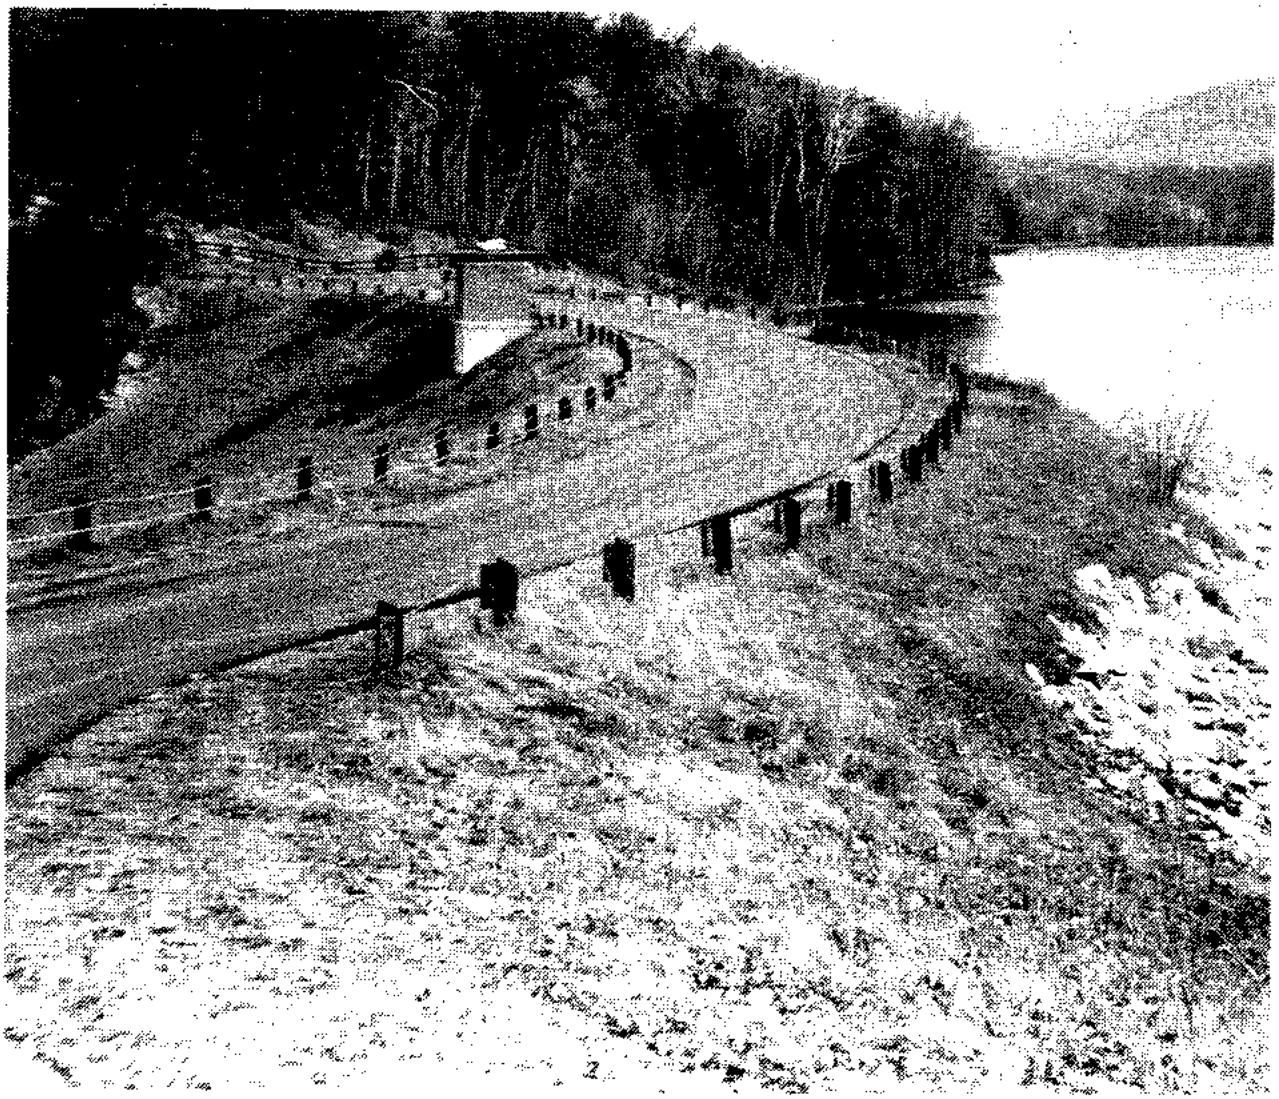


Burrow Under Slab

Hunting and Trapping Regulations

Because state regulations change from year to year, hunting and trapping or other methods used to eliminate animals from the dam may have certain restrictions. For more information, the dam owner should contact:

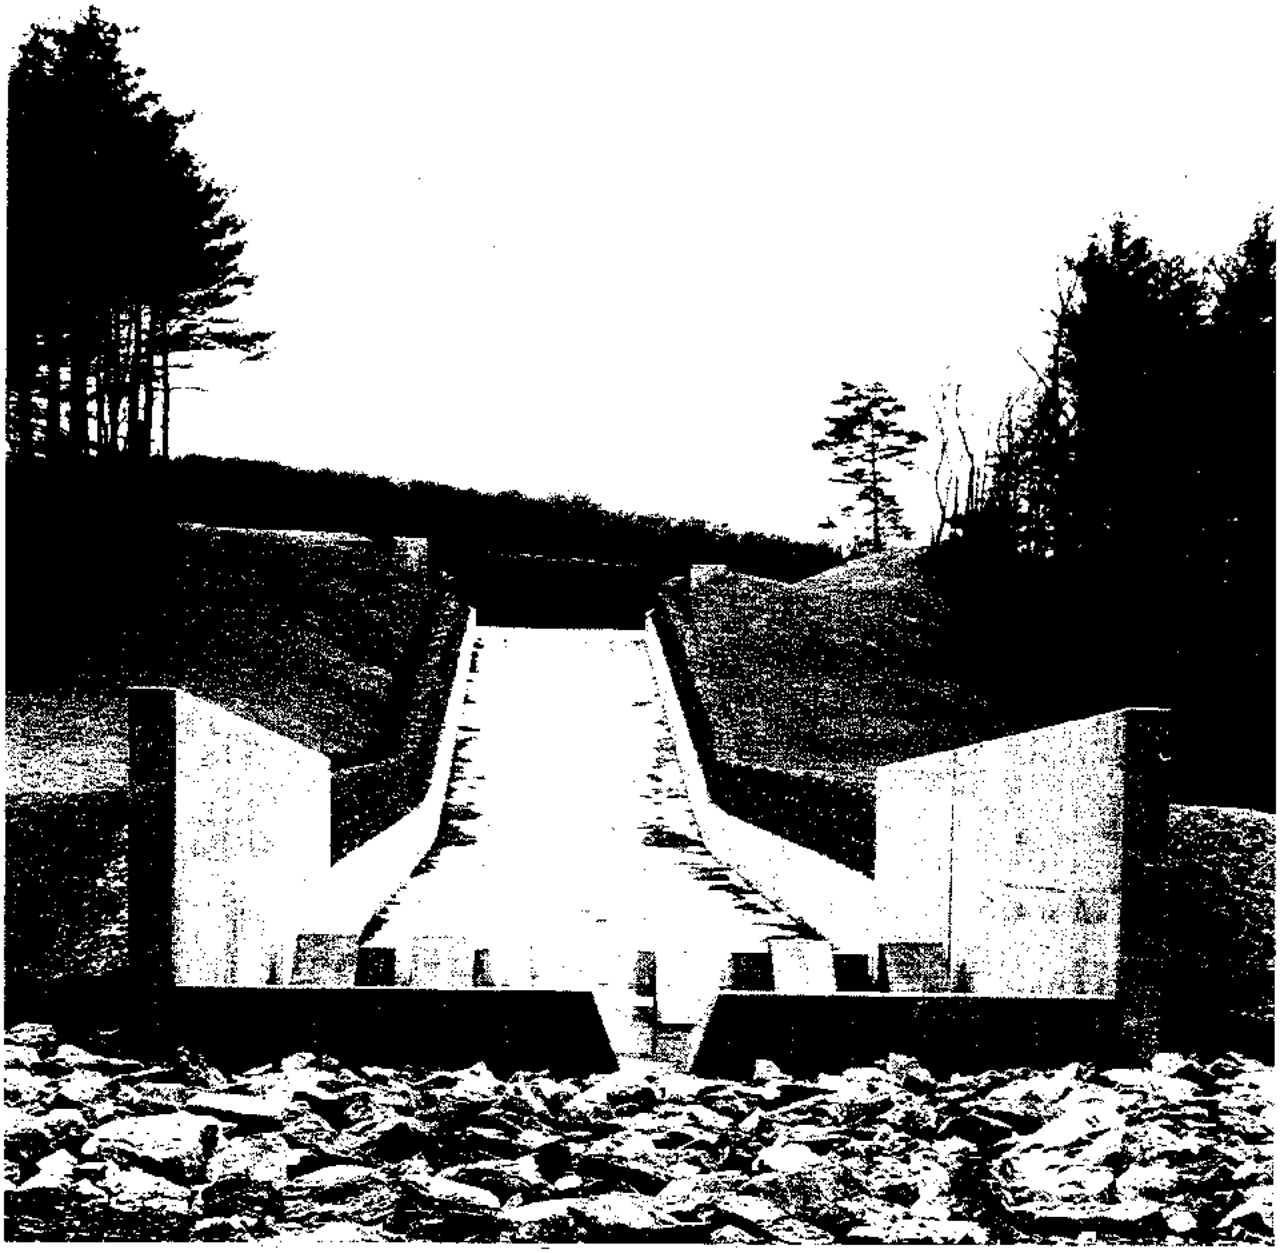
Maryland Department of Natural Resources
Wildlife Administration
Tawes State Office Building
Annapolis, Maryland 21401
(410) 974-3195.



Rodent Burrows

CREST OF THE DAM

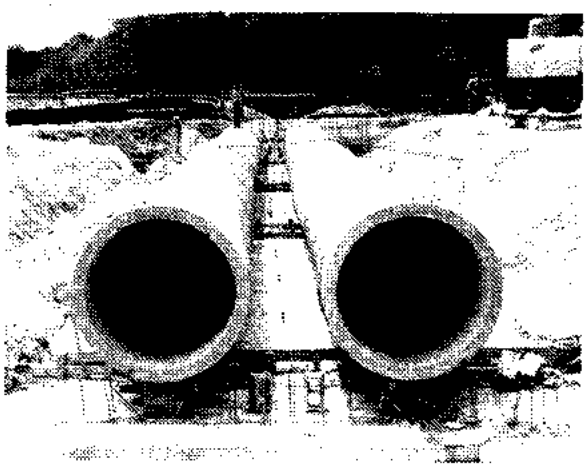
The crest, or top of the dam also requires attention and maintenance. The dam crest is usually constructed with a camber because some settlement of the embankment is anticipated.



Roads are often constructed along the dam crest in order to gain access to the other side of the dam or to simply gain access to the dam itself. Roads along or on the crest of dams should be maintained not only to keep the road in passable condition, but, more importantly, to prevent damage to the embankment. A road on the dam should be constructed with the proper base and wearing surface. If a well designed wearing surface has not been provided, traffic should not be allowed on the crest during wet conditions. Water collected in ruts may cause localized saturation, thereby weakening the embankment. Ruts that develop in the crest should be repaired as soon as possible. The crest of the dam should be graded to direct all surface drainage into the impoundment. Road drainage should not be concentrated at one location.

Heavily traveled paved roads may require special means for collection and drainage of surface water. If properly designed and constructed, guard rails, curbs, gutters, and rigid pavement may also be located on the crest of the dam.

SPILLWAY AND OUTLET WORKS



Many dams have a principal spillway that consists of a riser and conduit pipe. This spillway system carries the normal stream and small flood flows safely past the embankment. The emergency spillway will supplement the passage of larger flood flows around the dam to prevent major damage. Conduits are constructed of metal pipe or concrete depending on the size of the dam. Pipes through embankments are difficult to construct properly, can be extremely dangerous to the embankment if problems develop after construction, and are usually difficult to repair because of their location and size. These structures should not be neglected during the course of maintenance.

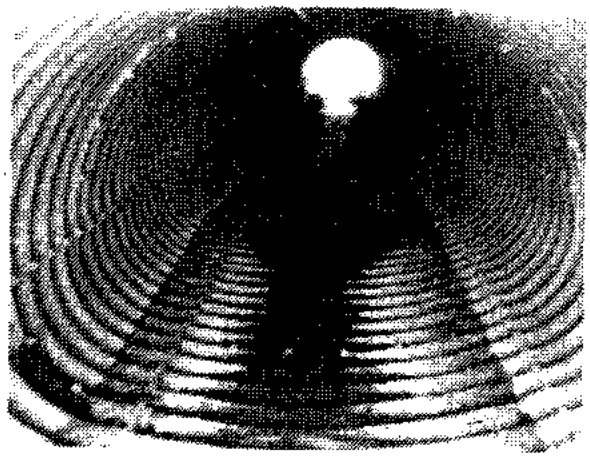
CONDUITS

Frequent inspection is necessary to ensure the spillway conduit is functioning properly. All conduits should be inspected thoroughly once a year. Conduits which are 36 inches or more in diameter can be entered and visually inspected. The conduits should be inspected for improper alignment (sagging), elongation and displacement at joints, cracks, leaks, surface wear, loss of protective coatings, corrosion, and blockage.



Concrete Conduit

Problems with conduits occur most often at joints, and special attention should be given to them during the inspection. The joints should be checked for gaps caused by elongation or settlement and loss of joint filler material. Open joints can permit erosion of embankment material into the pipe, or cause leakage of water into the embankment when the pipe is flowing full and under pressure. The outlet should be checked for signs of water seeping along the exterior surface of the pipe. A depression in the soil surface over the pipe may be a sign that soil is being removed from around the pipe.

Corrosion

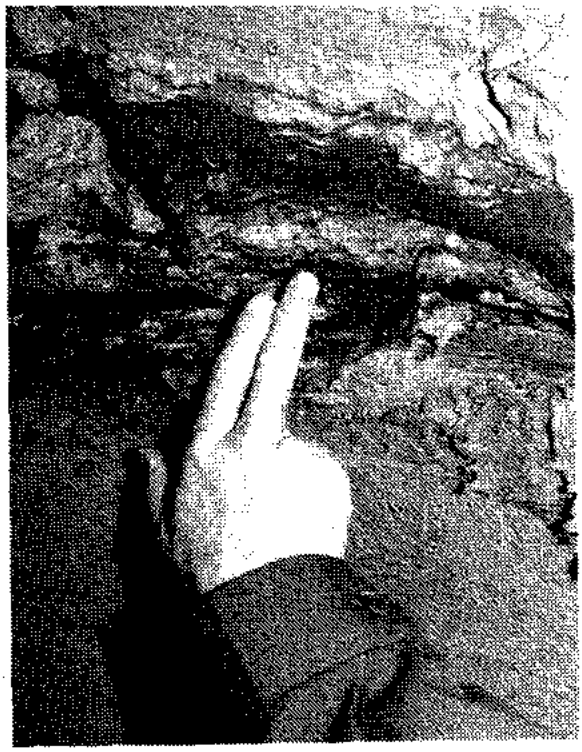
Corrosion is a common problem of metal pipe spillways and other conduits. Exposure to moisture, acid conditions, or salt will accelerate the corrosion process. Metal pipes are available which have been coated to resist corrosion. Coatings can be of epoxy, aluminum, zinc (galvanized), or bituminous asphalt. These coatings are generally applied at the time the pipe is manufactured. Coatings applied to pipes in service are generally not very effective because of the difficulty in establishing a lasting bond.

Metal Conduit Deterioration

Repair

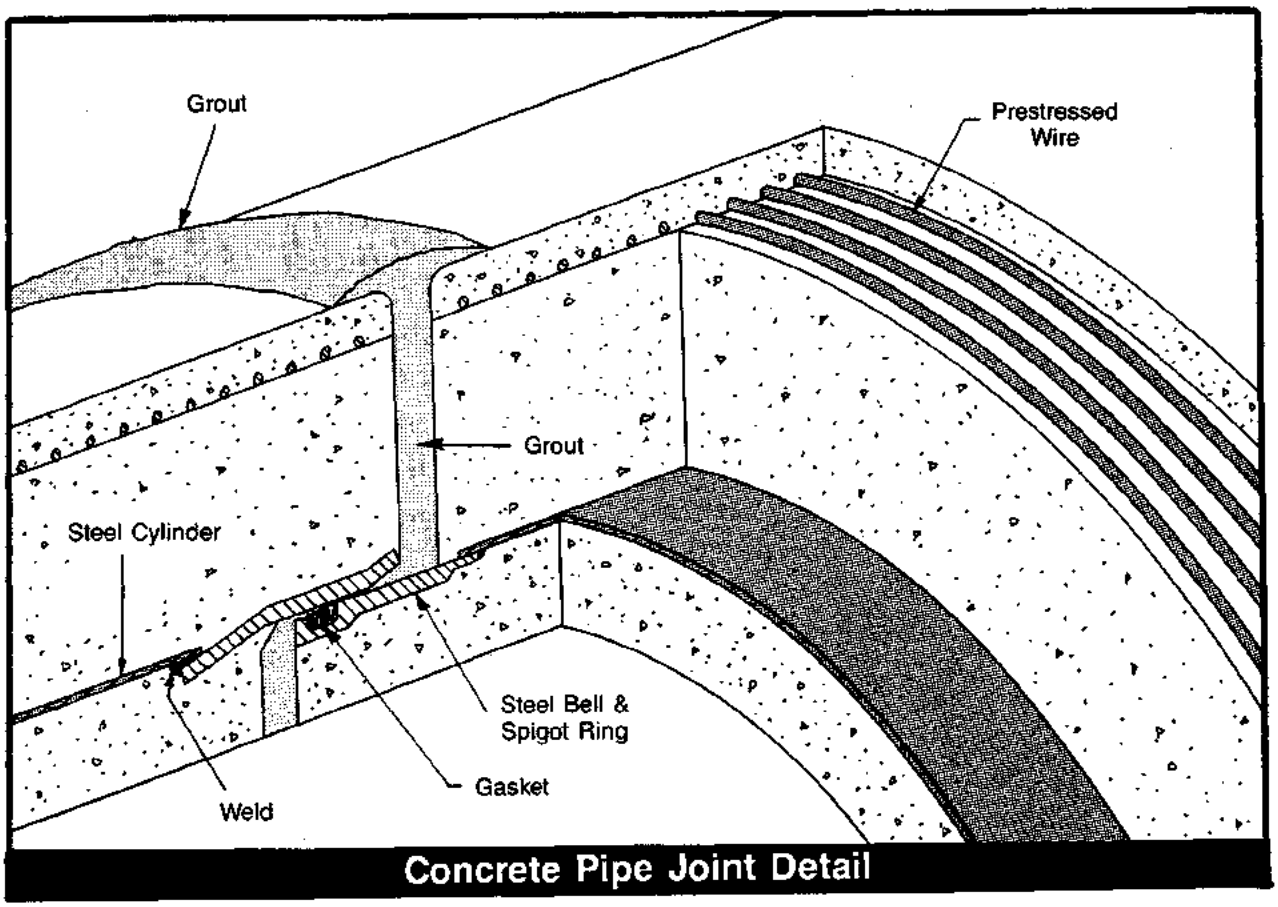
Effective repair of the internal surface or joint of a metal or concrete conduit is difficult, and should not be attempted without careful planning and proper professional supervision. Listed below are comments regarding common methods used in minor pipe repairs.

1. Asphalt mastic used as joint filler becomes hard and brittle, is easily eroded, and will generally provide a satisfactory seal for only about five years. Mastic should not be used if the pipe is expected to flow under pressure. For these reasons asphalt mastic is not recommended for other than temporary repairs.



2. The instructions on the label should be followed when using thermosetting plastics (epoxy). Most of these products must be applied to a very clean and dry surface to establish an effective bond.

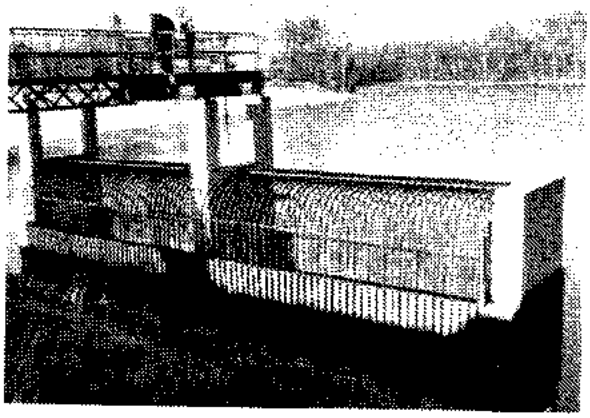
3. Joint filler compounds should be impervious to water, and should be flexible throughout the range of expected air and water temperatures.



4. The internal surfaces of the conduit should be made as smooth as possible when repairs are made so that high-velocity flow will not damage the repair material.

5. Oakum or gasket-type material can be hammered, jacked, or forced into an open crack or joint and is one of the most effective methods used to repair large openings.

6. Hairline cracks in concrete are not generally considered a dangerous problem, and repair is not needed unless the cracks open up. Cracks are generally repaired with an epoxy compound.



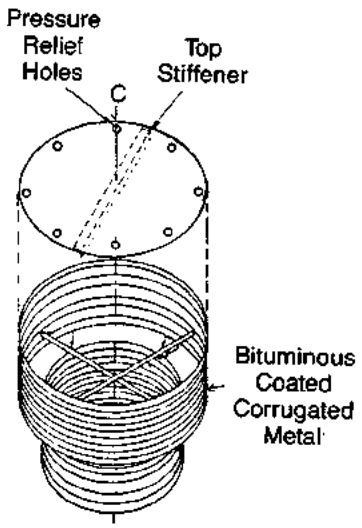
Severe Joint Deterioration

Concrete Pipe Joint Detail

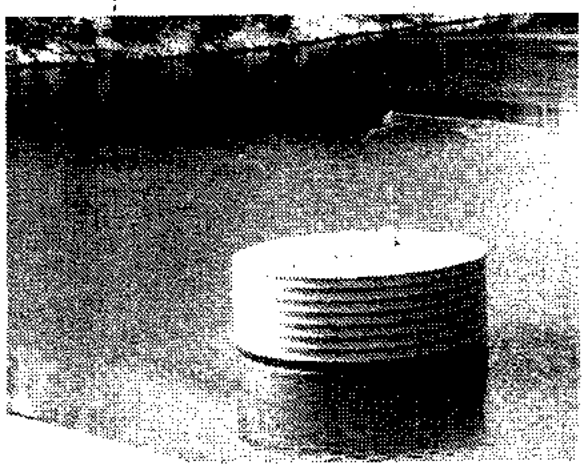
TRASH RACKS

The importance of a safe spillway cannot be overemphasized. Pipe spillways should always contain some type of trash rack in order to prevent accumulation of debris and possible misoperation during a flood event. Even though the emergency spillway is available to pass excess flows, it is generally designed to operate on a very infrequent basis and will sustain some damage during operation.

Welded Bar Trash Rack



A properly designed riser structure includes a trash rack that will allow passage of smaller debris yet not become clogged as larger debris accumulates around it. There are generally two types of trash rack designs: welded bar and hood. In a welded bar trash rack, the recommended minimum spacing of steel bars is 6 inches on center. Hooded trash racks are generally one piece units and contain either anti-vortex plates or a top plate to prevent debris from entering the conduit. A hooded trash rack is generally installed on a corrugated metal pipe riser, whereas a welded cross-bar trash rack is bolted over the openings of a concrete riser. Both types of trash racks are designed to prevent:



a) accumulation of small debris,
b) development of a whirlpool around the riser, and
c) damage from the hammering forces of debris.

Debris Accumulation

The trash rack unit should be checked periodically, especially after storm events, to ensure that it is functioning properly. Accumulated debris should be removed and maintenance performed if necessary. Under no circumstances should the unit be removed from the riser for an extended period.

CONCRETE

Concrete is a widely used material in dam construction. When made of quality materials and constructed properly, concrete is durable and strong. However, maintenance problems eventually develop in nearly all concrete structures. These problems are caused by design errors, construction errors, chemical attack, and natural forces.

Testing Concrete Strength

Inspection

Concrete surfaces should be inspected for cracking, spalling, displacement or movement, and deterioration by weathering, chemical reactions or leaching. Rust stains may indicate internal rusting and deterioration of reinforcing steel. Expansion and contraction joints should be inspected for signs of deterioration of the joint filler material, leakage, or abnormal movement. Drains designed to relieve water pressure beneath slabs and behind walls should be functional.

Repair Techniques

Concrete problems are structural problems that require structural solutions in order to be long lasting. Concrete repairs can be broken down into several categories as follows:

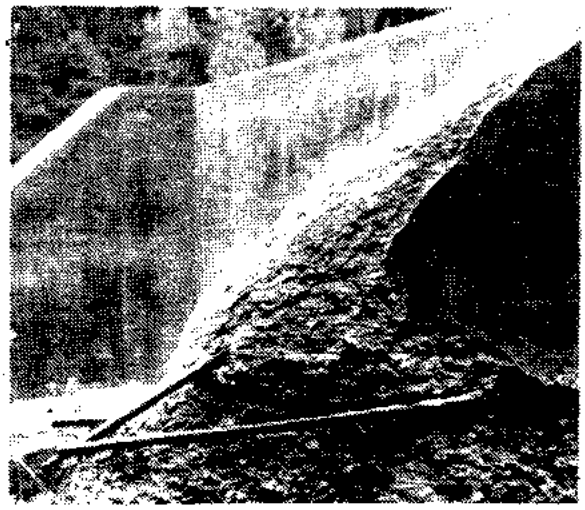
Patching	**Joint Repair**
Grouting	**Strengthening**
Coatings	**Crack Repair**

Concrete repair techniques are specialized, and depend on the concrete problems encountered. Dam owners are encouraged to consult with a professional in order to select the most appropriate repair method.

Extensive cracking, slab or wall movement, large areas of exposed reinforcing steel, and severe undermining are examples of structural problems which require professional advice and a permit from the Dam Safety Division before repairs can be made. These repairs, not addressed here, are generally expensive and require a custom designed solution.

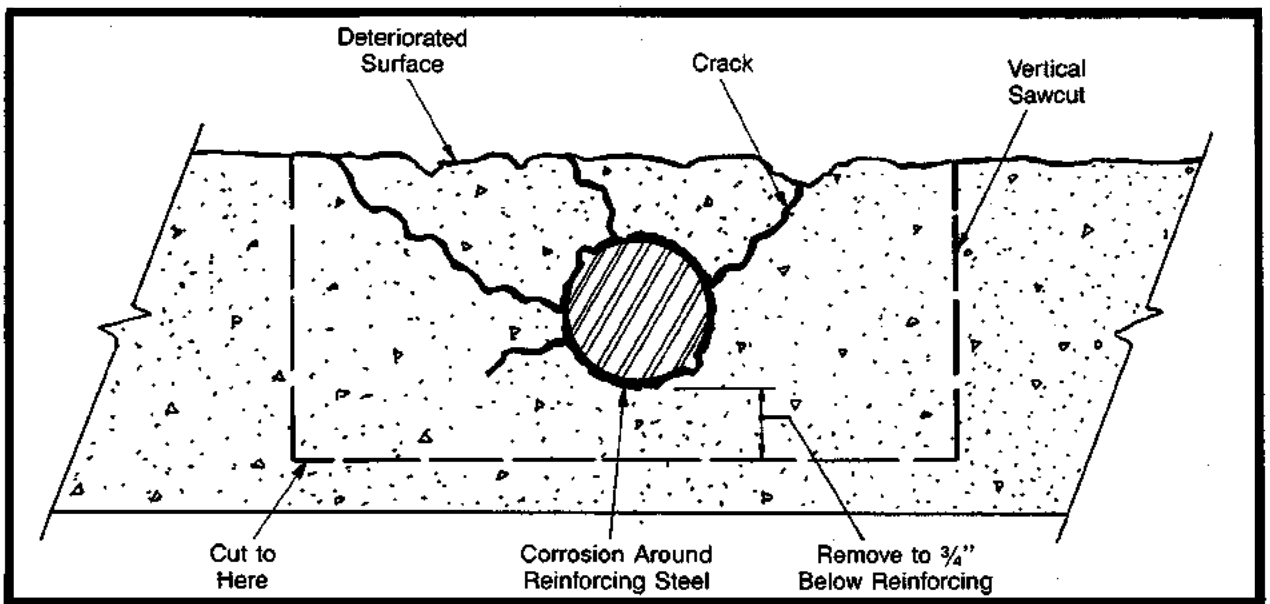
Minor repairs, as outlined below, can be performed during routine maintenance. Although these repairs are seldom a permanent solution to concrete problems, minor repairs may help to prolong the useful life of the structure.

Concrete Spalling



Spalled concrete. Spalling is the loss of surface concrete and can expose the reinforcing steel. Patching is the process of replacing this material. All loose and unsound concrete should be removed from the spalled area and beneath the reinforcing bars if they are exposed. The edges of the area to be repaired, should be saw cut to about 3/4" deep. An appropriate bonding agent

may be applied prior to patching with new concrete. If the spalled area is large enough, anchors must be installed to hold the replacement concrete in position. This work should be done by an experienced contractor.



Abutment Wall Crack

Cracks. Small cracks may be repaired by surface sealing with an appropriate adhesive. Epoxy injection, and sawcut and seal techniques are used for larger cracks. Surface sealing is used to stop water flows or as a temporary measure until more permanent crack repairs can be made.

Concrete Deterioration

Surface deterioration. Concrete deterioration on dams is accelerated by the presence of chemicals in the water as well as the freeze-thaw process. Many types of commercial coatings are available to make the concrete resistant to this deterioration. The selection of an appropriate sealer is difficult and must be carefully matched to the specific problem. A specialty contractor should perform the repairs and apply the coating.

Concrete Crack Repair

VEGETATED SPILLWAYS

Dams are designed to safely pass a certain "inflow design flood." This flow is in excess of what is considered the normal operating range for the dam. A concrete dam that consists of a single monolithic structure is generally designed to pass the full range of flows anticipated. However, an earthen structure would most certainly be washed away if flow were to pass over top. Therefore, it is impractical, and economically unfeasible, to size the principal spillway to pass the inflow design flood. For this reason an earthen type of dam must allow flood flows to pass around the embankment section through an emergency spillway.

Emergency Spillway

It is extremely important that the dam owner understand the purpose and function of the emergency, or auxiliary, spillway. This area of the dam is often neglected because the owner rarely sees flow in the spillway. It is a common perception of the dam owner that his structure is fail-safe.

Emergency Spillway In Operation

The emergency spillway is designed to pass flood flows around the dam on an infrequent basis. This type of spillway usually consists of a vegetated earthen channel that is precisely dimensioned to convey water without overtopping the dam. A certain amount of erosion and damage to the spillway is anticipated into the overall design.

A typical spillway section consists of the inlet, control section, and outlet channel.

Spillway Inspection

Vegetated earth spillways are usually the most economical means to provide emergency spillway capacity. Normal flows are carried by the principal spillway, and infrequent large flood flows pass primarily through the emergency spillway. For dams with pipe-conduit spillways, an emergency spillway is almost always required as a back-up in case the pipe becomes plugged.

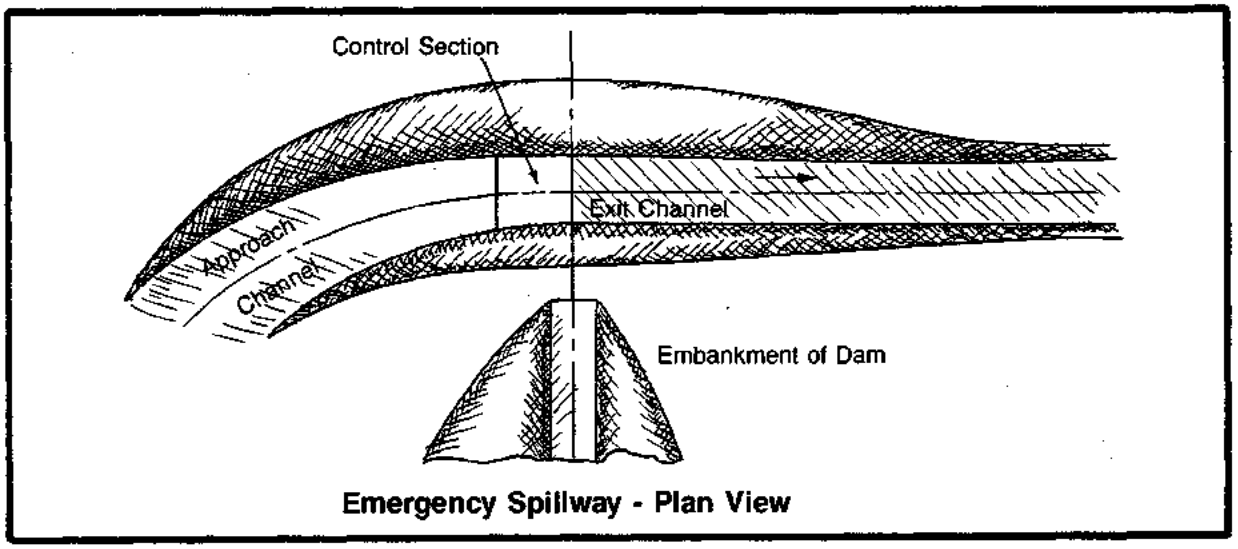
Maintenance and Repair of Vegetated Earth Spillways

Since the vegetated emergency spillway is used on an infrequent basis, maintenance of the channel should not be a burdensome task. As in the case of the embankment maintenance, there are certain items that need to be attended to that include:

1. **Maintenance of vegetation.** Periodic mowing to prevent trees, brush, and weeds from creating a flow obstruction,particularly at the control section. A poor vegetative cover will usually result in extensive, rapid erosion when the spillway flows, and require more costly repairs. The vegetative cover should be given the same care and maintenance as the embankment of the dam. Reseeding and fertilization is necessary to maintain a vigorous growth of vegetation. Kentucky 31 fescue is an excellent grass for erosion protection (see section on vegetation).

2. **Prompt repair of damage.** Repair of erosion damage, particularly after high flows. Erosion can be expected in the spillway channel during high flows, and can also occur as a result of rainfall and local runoff. The

latter is more of a problem in large spillways, and may require special treatment, such as terraces or drainage channels. Erosion of the side slopes will deposit material in the spillway channel, especially where the side slopes meet the channel bottom. In small spillways, this can significantly reduce the spillway capacity. This condition often occurs immediately after construction, before vegetation becomes established. In these cases, it may be necessary to reshape the channel to provide the flow capacity.



3. **Removal of flow obstructions.** Emergency spillways are often used for purposes other than the passage of flood flows. Among these uses are reservoir access, parking lots, boat ramps, boat storage, pasture and cropland. Permanent structures (buildings, fences, etc.) should not be constructed in these spillways. If fences are absolutely necessary, they should cross the spillway far enough away from its control section (at the highest point in the channel) so they do not interfere with flow. Any change to the dimensions of the spillway channel will alter its capacity to carry flood flows and could cause failure of the dam.

Eroded Spillway

Spillway After Repair

Emergency Spillway - Plan View

OUTLET

Erosion at the spillway outlet, whether it be a pipe or overflow spillway, is one of the more common spillway problems encountered in the maintenance of a dam. Severe undermining of the outlet can displace sections of pipe, cause slides in the downstream slope as erosion continues, and eventually lead to complete failure of the dam. Water must be conveyed safely from the lake to a point downstream of the dam without endangering the spillway or embankment. Often the spillway outlet is adequately protected for normal flow conditions, but not for extreme flows. It is easy to underestimate the energy and force of flowing water and overestimate the resistance of the outlet material (earth, rock, concrete, etc). The required level of protection is hard to establish by visual inspection, but can usually be determined by hydraulic calculations performed by a professional engineer.

Properly Constructed Outlet

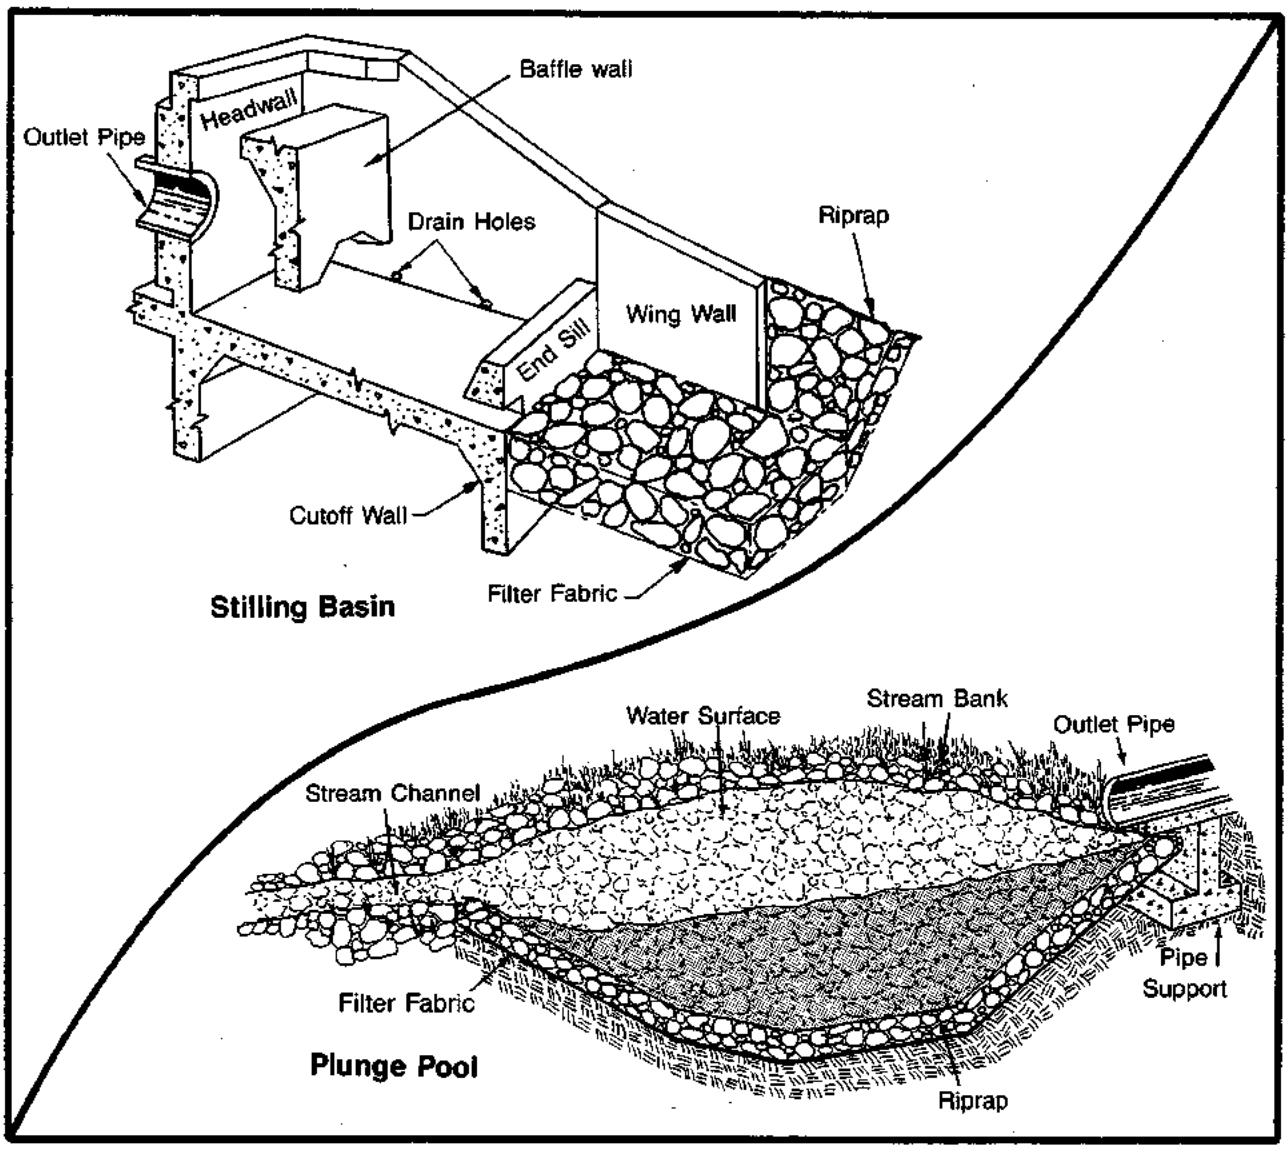
Structures that provide for complete erosion control at a spillway outlet are usually expensive to construct, but often necessary. These structures consist of some type of impact basin to reduce flow velocities at the outlet. A concrete overflow section contains a bucket dissipator to deflect water away from the toe of the dam. The most common types of conduit outlet structures are the stilling basin and plunge pool. The major difference between these two designs is that the stilling basin is a concrete structure, whereas the plunge pool is an excavated pool that is armored with riprap for protection against scour. As areas of erosion and deterioration develop, repairs must be promptly initiated.

The following four factors, often interrelated, contribute to erosion and scour at the spillway outlet:

1. Flows emerging from the spillway are generally of high velocity such that the moving water will scour soil material from the outlet channel and leave eroded areas. This erosion is difficult to design for, and requires the outlet be protected for a safe distance downstream from the dam.

Erosion Under Outlet Slab

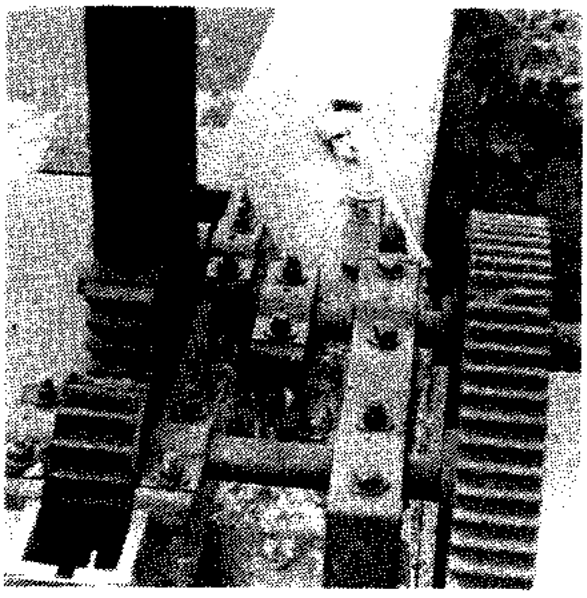
2. Flows emerging from the outlet are at an elevation above the stream channel. If the outlet flows emerge at the correct elevation, tailwater in the stream channel can be used to absorb a substantial amount of the high velocity flow.



3. Flows leaving the outlet at high velocity can create negative

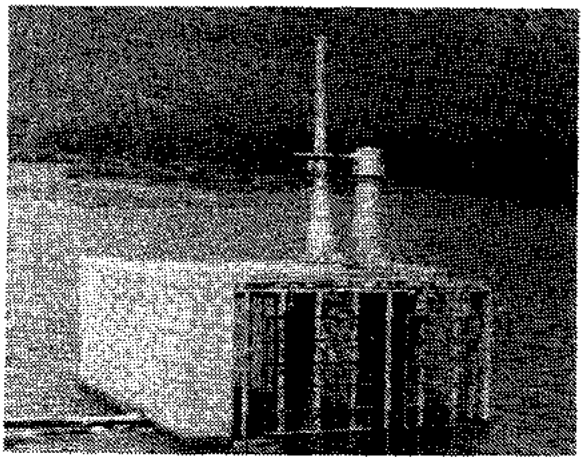
pressures that can cause material to be loosened and removed from the floor and walls of the outlet channel. This action is called "cavitation" when it occurs on concrete or metal surfaces. Venting can sometimes be used to relieve negative pressures.

4. Water leaking through pipe joints or flowing along a pipe from the reservoir may weaken the soil structure around the pipe outlet. Inadequate compaction adjacent to the conduit during construction adds to the problem.



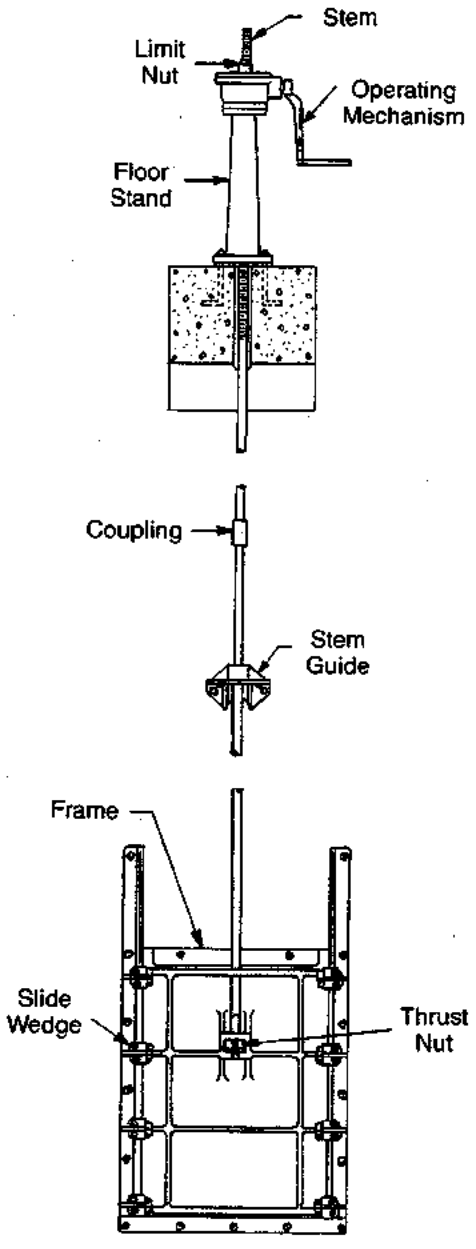
Eroded and undermined areas at spillway outlets can sometimes be repaired by filling these areas with large stone. Stone that is large enough to be effective needs to weigh at least 500 pounds (18 to 24 inches in diameter). Often stone this size is not available or is expensive to buy and haul. Concrete slurry can be used to bind smaller stones together to increase their effective size and weight. Gabions have been used successfully in areas where the velocity is low, but should be used cautiously where high velocity and turbulence are expected. Gabions require careful foundation preparation and experienced personnel for installation.

In many cases, professional help should be obtained for the design and construction of the outlet protection.



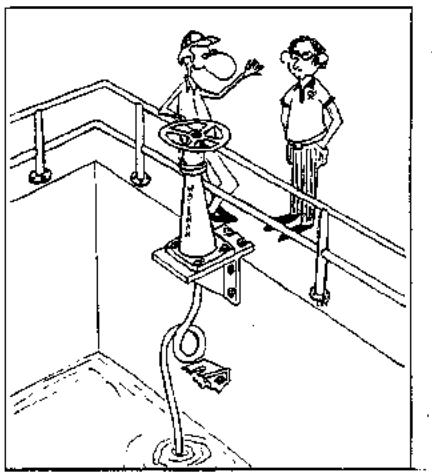
MECHANICAL EQUIPMENT

Mechanical equipment includes spillway gates, sluice gates valves for lake drains or water supply pipes, stoplogs, sump pumps, flashboards, relief wells, emergency power sources, siphons, and other devices. The owner should have copies of all manufacturers' literature for the mechanical equipment. All mechanical and associated electrical equipment should be tested according to the manufacturer's recommendations. Recommended maintenance should be performed at that time. The equipment test should be conducted through the full operating range under actual operating conditions to determine whether the equipment performs satisfactorily. Operating instructions should be checked for clarity, and maintained in a secure but readily accessible location. Each operating device should be permanently marked for easy identification. All equipment controls should be checked for proper security to prevent vandalism.



Protecting Metal Parts

Corrosion of metal parts of operating mechanisms can be effectively prevented at the time maintenance is performed by keeping these parts greased or painted.



Mechanical Gate Lift

Water Control Gate

LAKE DRAINS

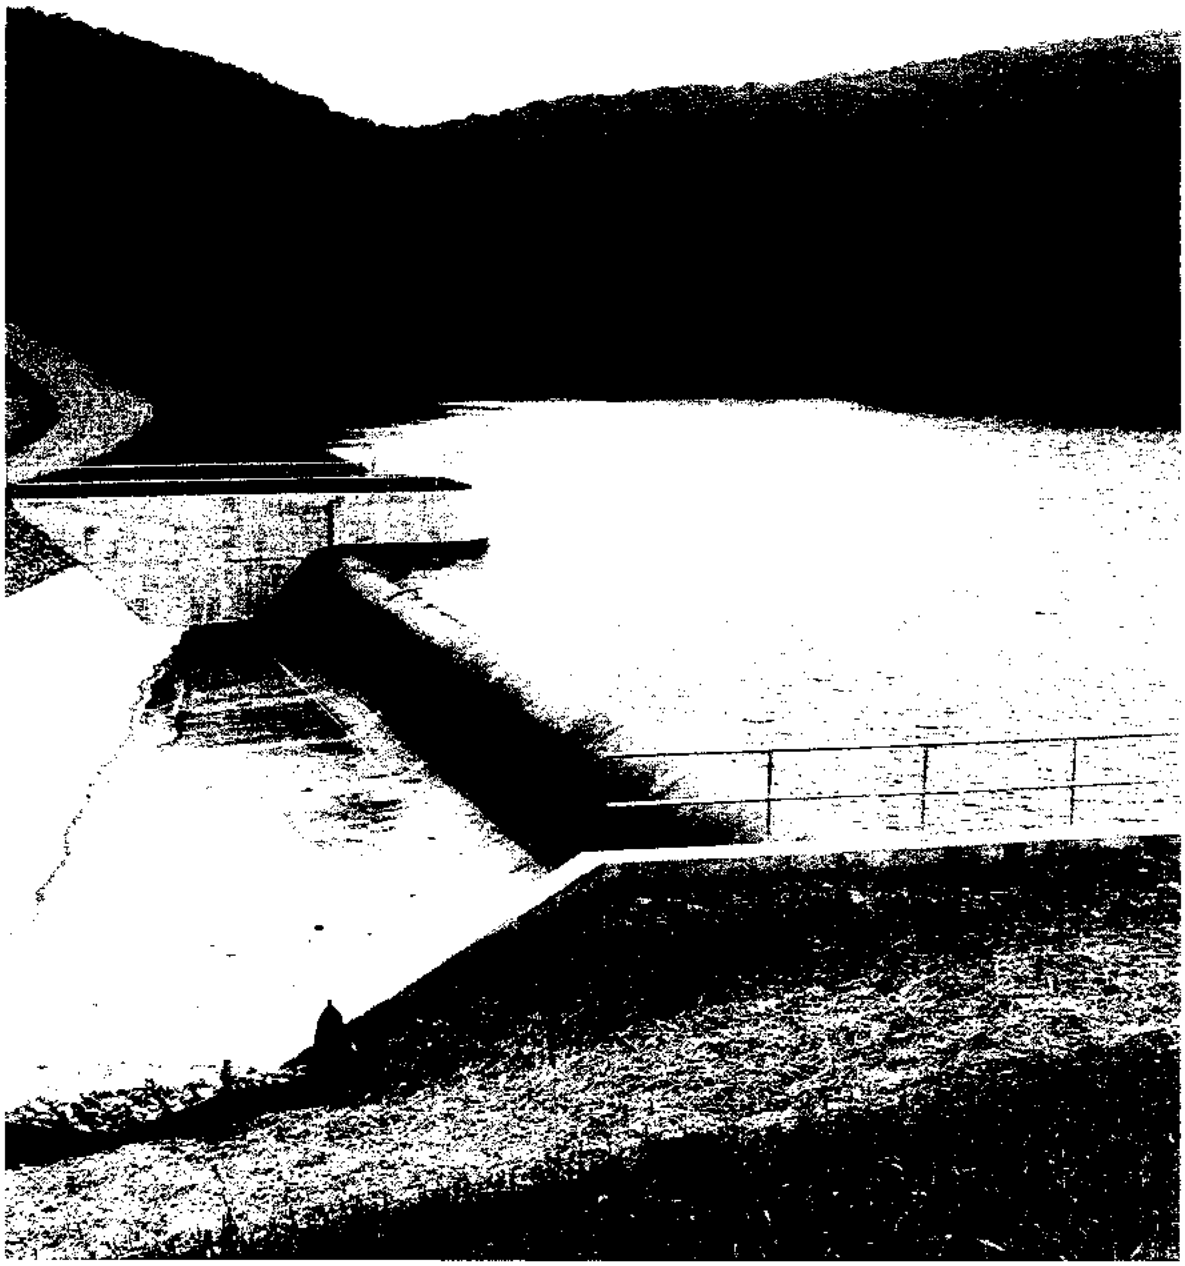
The lake drain should always be operable in order for the pool level to be drawn down in case of an emergency or for necessary repairs. Lake drain valves or gates that have not been operated for a long time present a special problem for dam owners. If the valve cannot be closed after it is opened, the impoundment could be completely drained. Therefore, before operating a valve or gate, it should be carefully inspected and all appropriate parts lubricated and repaired.

I turned it too hard!

An uncontrolled and rapid drawdown of the lake level could induce more serious problems such as slides in the saturated upstream slope of the embankment or reservoir area. Drawdown rates should not exceed 1 foot per week for slopes of clay or silt material except for emergency situations. Very flat slopes or slopes with free-draining upstream zones can withstand more rapid drawdown rates. It is prudent to advise downstream residents of large or prolonged discharges because of the possibility of downstream flooding.

If problems are encountered during the exercising of the drain valve, the operator should stop the test immediately. A professional engineer or the Dam Safety Division should be contacted for advice and assistance in properly exercising a questionable drain gate. Before testing a gate that is suspected to be faulty, the drain inlet upstream from the valve should be physically blocked. Some drain structures have been designed with this capability and have dual valves or gates, or slots for stoplogs (sometimes called bulkheads) located upstream of the drain valve. Divers can be hired to inspect the drain inlet, and may be able to construct a temporary block at the inlet for testing purposes.

Other problems may be encountered when operating the lake drain. Sediment can build up and block the drain inlet. Debris can be carried into the valve chamber, hindering its function if an effective trash rack is not present. These problems can be minimized if the valve or gate is operated and maintained periodically. The gate or valve controlling the lake drain should be operated from the fully closed to fully opened position as recommended by the manufacturer or at least once each year. Early detection of equipment problems or breakdowns, and confidence in equipment operability, are the benefits of periodic operation.



Some older dams have drains with valves at the downstream toe. If the valve is located at the downstream end of a pressurized conduit extending through the embankment, the conduit is under the constant pressure of the reservoir. If a leak in the conduit develops within the embankment, saturation, erosion, and possibly failure of the embankment could occur. A depression in the soil surface over the pipe may be a sign that soil is being removed from around it. These older structures should be monitored closely and owners should plan to relocate the valve upstream or install a new drain structure. Inspectors should closely examine the drain outlet for signs of possible problems.

Reservoir Lake Drain

RESERVOIR

A well documented operation and maintenance program for the dam will include periodic attention to the reservoir pool. The amount of attention needed will generally depend on the size of the facility as well as its intended use. The most frequent maintenance will include the removal of debris entering the reservoir in order to prevent clogging of the spillway section.

POOL LEVELS

Reservoir pool levels are often controlled by a combination of spillway gates, flashboards, and lake drain and release structures. The drawdown rate of the pool level should be made over a gradual period of time. Rapid drawdown of the lake could cause a failure of the embankment slope. The dam owner should follow the drawdown guidelines described in the Mechanical Equipment section under Spillway and Outlet Works.

Listed below are conditions or instances in which the pool level might be permanently or temporarily lowered.

1. Maintenance or repair activity requires the pool to be lowered. Drawdown is temporary until the work is accomplished.

2. Water is released to the downstream channel, supplementing streamflow during dry conditions. This may temporarily lower the lake level if there is little inflow to the lake.

3. Water supply reservoir levels will fluctuate according to the service area's demand for water. Flashboards are sometimes used to permanently or temporarily raise the pool level of water supply reservoirs. Flashboards should not be installed or allowed unless there is sufficient freeboard remaining to safely pass the inflow design flood. The installation of flashboards requires a permit from the Dam Safety Division.

4. The pool level is drawn down in the winter to facilitate repair of boat docks, to retard growth of aquatic vegetation along the shoreline, or to allow additional storage for spring runoff.

5. Pool levels are sometimes adjusted for recreation, hydropower, or waterfowl and fish management.

AQUATIC VEGETATION

Control of most aquatic vegetation can be accomplished through the use of chemical herbicides. Aquatic vegetation is classified into three major groups: **floating growth**, **submerged growth**, and **emergent growth**.

Floating growth is a floating dense mat of hair-like fibers. The most common form is filamentous planktonic algae. Most species can be controlled with very low concentrations of copper sulfate or Cutrine-Plus. Application instructions can be found on the product label. Caution should be exercised as copper sulfate can kill new hatches of fish if applied when fish are spawning.

Submerged growth is attached to the lake bottom and has most of its growth below the water surface. It grows mostly in clear, calm, shallow water. Herbicides for submerged weeds are available as liquids, wettable powders (to be mixed with water), and granules. Liquids and wettable powders release their active ingredients immediately and work best when used in spring through midsummer. Granular herbicides release their active ingredients more slowly and should be used early in the growing season or on a spot treatment basis.

Emergent growth is found along the shoreline and in shallow water where the stems and leaves extend out of the water. Cattails, bulrushes, and spatterdock are examples frequently found in these areas. A non-chemical method of control is to increase the water depth in the area of growth by maintaining a steep slope, at least 3H:1V, along the shore. Most herbicides used for land weed control can also be used for emergent growth if combined with a wetting and sticking agent. In addition to commercially available wetting and sticking agents, two tablespoons of liquid household detergent per gallon of herbicide may be used. The mixture is then sprayed until a thin film covers the leaves. Common herbicides include 2-4-D products and Diquat.

Chara, **duckweed**, and **watermeal** are growths that do not fit the above categories. **Chara (muskgrass, stonewart)** grows in dense clumps in shallow areas and is an advanced form of algae. **Duckweed**, a floating weed, has small three-lobed leaves with rootlets that hang down in the water. **Watermeal** consists of small green grains floating in the water.

The use of herbicides for aquatic management is controlled by the Department of Health and Mental Hygiene. These herbicides are classified as either "restricted use" or "general use" products and are identified as such on the product container. Maryland regulations require a permit for the use of **ANY** toxic material for aquatic life management. In addition, the application of a restricted use product requires certification by the Maryland Department of Agriculture. General use products may be applied by an individual property owner without the certification requirement.

With most general use commercial herbicides, application instructions, environmental precautions, and a list of weeds controlled will be found on the label. Always **READ THE LABEL CAREFULLY** and **NEVER** mix different herbicides. Herbicides can be purchased from a local agricultural supply center.

For information on obtaining a permit for the application of herbicides contact the Maryland Department of the Environment at 1-800-633-6101.

For a more complete discussion of aquatic weed control, contact the Maryland Department of Agriculture, Pesticide Regulation Branch, 50 Harry S. Truman Parkway, Annapolis, MD 21401, phone (410) 841-5710, or your local Cooperative Extension Office.

SEDIMENTATION

Sediment is the end product of erosion, which is the naturally occurring process of the wearing away of the earth's land surface. In addition to this natural process, erosion is worsened by man's activities that include construction, foresting, and agricultural practices. The sediment resulting from the entire erosion process in a watershed shows up as physical damage downstream such as:

a) filling in of stream channels and bridges,
b) environmental damage,
c) damage to recreational facilities, and
d) filling of reservoirs.

Sediment Damage

Damages

The damage resulting from sedimentation amounts to millions of dollars annually. These costs can have a significant impact on the useful life of a reservoir. The portion of eroded material that travels through the drainage network to the reservoir is referred to as the sediment yield. Old reservoirs, designed without consideration for sediment yield, are often abandoned because the cost to reestablish a desirable lake is prohibitive. New facilities that are permitted by the Dam Safety Division generally include additional reservoir storage capacity to account for sedimentation. This capacity shows up as an increased project cost to the dam owner.

Sediment Yield Rate

The very existence of a dam in a watershed drainage network upsets the natural equilibrium of the stream. Aggradation, or sediment deposition, occurs above the dam, while degradation of the stream channel can result downstream from the dam.

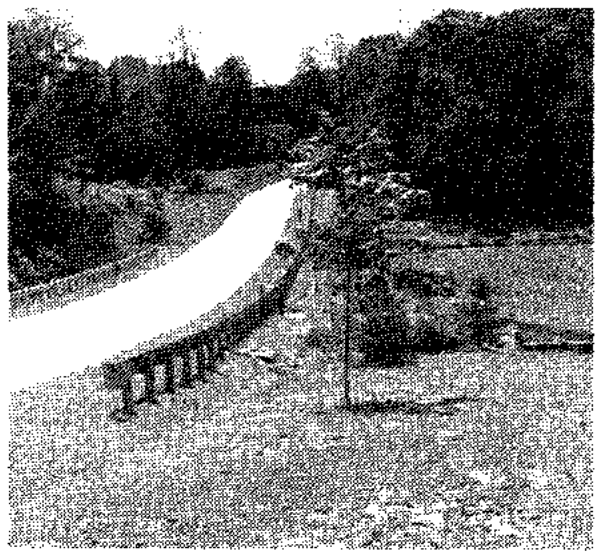
Sediment deposits first become apparent when deltas build up at the mouths of streams entering the lake. The coarser, heavier sediments are deposited at the inflow to the reservoir while finer particles may be carried as far as the upstream face of the dam. Aquatic vegetation, such as cattails and lily pads, soon develops in the shallow water over these deltas. As sediment deposition continues, the delta will rise above the water surface.

Sedimentation Control

Sediments entering the reservoir cannot be totally eliminated. Therefore, the dam owner should take measures to minimize the effects and consider the annual maintenance costs. One method of controlling sediments is to periodically dredge areas of the lake where sediments have accumulated. This method is usually expensive and includes finding a disposal area for the dredged material.

Another method of sediment control is the construction of sediment "forebays" at locations of stream inflow to the lake. While these areas will also have to be dredged periodically,they limit the amount of time and effort the contractor will have to put into the job. This in turn may limit the cost of dredging to the owner.

Another method of controlling sedimentation is to take an active role in community efforts to control erosion runoff from construction sites. Violations of sediment control laws should be reported to the local sediment control inspector.



Finally, every method of controlling sediments should include periodically exercising the drain valve to keep sediments from obstructing or burying the inlet.

LAKE PERIMETER AND ACCESS ROADS

The safe operation of a dam also depends on the ability to gain access to all parts of the dam and reservoir. The perimeter of the reservoir can be affected by the fluctuating pool level and is a source of debris and sediments entering the lake.

A function performed during the routine maintenance program should include an inspection of the lake perimeter. Potentially damaging fallen trees, debris, and sediments should be removed.

The access road to the dam itself should also be inspected. The road should be suitable for maintenance equipment to gain access to the structure at all times. Cut-and-fill slopes, both uphill and downhill from the road should be stable. The road surface should be located above the projected high-water elevations of any adjacent streams and the reservoir pool, so access can be maintained during periods of high water.

Paved Access Road

WINTERIZING TECHNIQUES AND PROBLEMS

The pool level of a reservoir is often lowered for the winter months for various reasons: to facilitate repair of boat docks and other structures; to retard growth of aquatic vegetation; to provide additional spring flood storage; or to prevent ice damage. Rapid drawdown of the pool will leave the upstream slope saturated and without support, and could result in sloughs and slides. Unless there is an emergency, the owner should follow the drawdown guidelines described in the Mechanical Equipment section under Spillway and Outlet Works. If there is a question about the allowable drawdown rate, a professional should be contacted. The dam owner should also contact the Dam Safety Division immediately if the pool needs to be drawn down quickly.

Ice can pose problems at spillways and around other structures. Ice formation can be prevented by heaters, aeration equipment, or forced movement of water. Ice in conduit outlets or stilling basins can impair their proper functioning. The owner should be aware of these potential problems and take appropriate action during extended periods of severe cold weather. Ice damage from impact can also occur during thaw when large chunks of ice begin to break free.

Other winterizing activities should include:

1. Seeding bare areas so that vegetation is established before onset of winter.

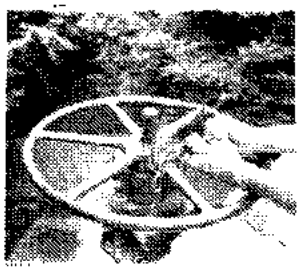
2. Removing spillway flashboards for providing additional pool storage.

3. Opening valves slightly to provide a small flow to prevent freezing.

VANDALISM

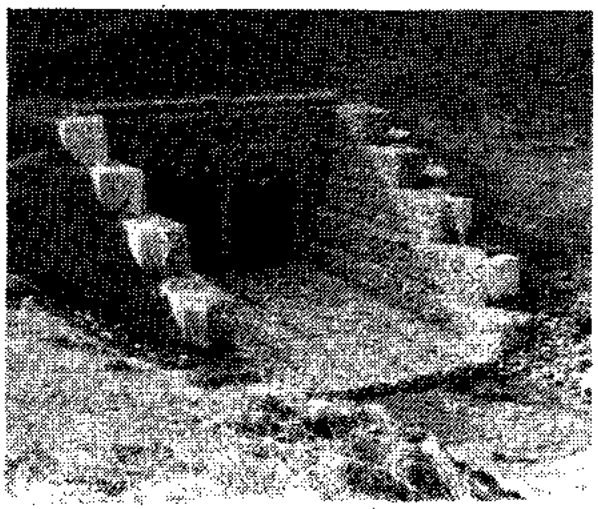
Vandalism is a common problem faced by all dam owners. Particularly susceptible to damage are the vegetated surfaces of the embankment, mechanical equipment, manhole covers, and rock riprap. Every precaution should be taken to limit access to the dam by unauthorized persons and vehicles.

Unauthorized Vehicles



Motorcycles and four-wheel drive vehicles will severely damage the vegetation on embankments. Worn areas could lead to erosion and more serious problems. Barriers such as fences, gates, and cables strung between poles are effective ways to limit access by these vehicles. Fences must not be installed around the emergency spillway area because they can impede the safe discharge of flood waters. A metal or wooden guardrail constructed immediately adjacent to the toe of the downstream slope is an excellent means for keeping vehicles off embankments. However, this may interfere with the operation of mowing equipment.

Damage to Slope



Mechanical Equipment

Mechanical equipment and its associated control mechanism should be protected. Buildings housing mechanical equipment should be sturdy, have protected windows, heavy-duty doors, and should be secured with deadbolt locks or padlocks. Detachable controls such as handles and wheels should be removed when not in use and stored inside. Other controls should be secured with locks and heavy chains where possible. Manhole covers are also subject to removal and are often thrown into the lake or spillway by vandals.

Rock Riprap

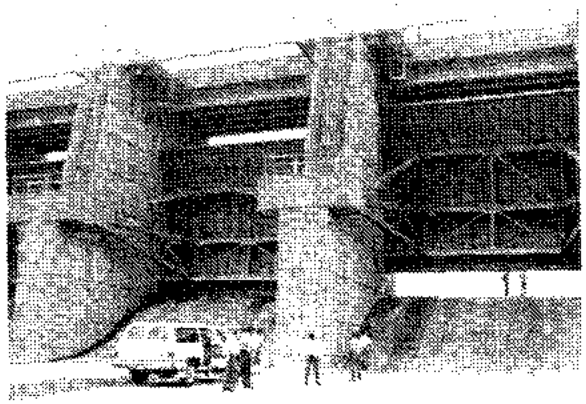
Rock used as riprap or inside gabion baskets is often thrown into the lake, spillways, stilling basins, and elsewhere. Riprap is often displaced by fishermen to form benches. The best way to prevent this abuse is to use rock too large and heavy to move easily. Otherwise, the rock must be constantly replenished and other damages repaired.

Removal of Rock Could Endanger Outlet

FISH STOCKING

Pond owners can receive advice on management of the lake for fishing from the Maryland Department of Natural Resources. Fishery management information is available that describes activities such as fertilization, liming, and stocking, as well as common problems associated with ponds, and recommended solutions. For additional information contact:

Maryland Department of Natural Resources
Freshwater Fisheries
Tawes State Office Building
Annapolis, Maryland 21401
(410) 974-3061



INSPECTIONS

Periodic inspection is an essential part of dam operation. Owners are encouraged to make a thorough visual inspection of their dams at least twice a year - once in the summer after mowing, and once in the winter when the vegetative cover is dormant. Inspections should also be made after extreme rainfall events. Owners of high hazard (Category I) dams are encouraged to have their dams inspected by a registered professional engineer at least once every 5 years.

INSPECTION GUIDELINES

The external surface of an earth dam can often provide clues to the condition of the interior of the structure. A thorough evaluation of all exposed surfaces of the dam should be made during the inspection. It is important to note changes in the appearance of the structure from one inspection to the next. If any of the following conditions are noted, **emergency procedures** are warranted: muddy water is flowing from the downstream slope or toe; cracks or depressions are forming on the embankment; movement of the embankment is occurring; or flood flow over top of the embankment is imminent.

Inspection of Large Dam

During the inspection, the embankment should be examined for settlement, displacement, cracking, erosion, and adequacy of the vegetative cover. The downstream slope and toe area should also be inspected for signs of seepage such as wet spots, wet ground vegetation, boils, or depressions. Internal drainage systems should be examined for chemical deposits, algae growth, corrosion or other deterioration, and clogging or obstruction. Any instrumentation for the structure should be examined and the appropriate readings and measurements taken. Observation wells, weirs, and water level gages can often be read with simple equipment. Settlement monuments, piezometers and slope inclinometers require specialized equipment for readings and engineering evaluation of the data is necessary.

The Dam Safety Division of the Water Resources Administration also conducts periodic inspections of many dams in an effort to assist owners in the safe operation of their structure. These inspections are made at intervals of one to five years that are determined by the type, size, and importance of the dam as well as its age and overall condition, spillway type, past performance, and potential to cause damage in the event of a failure.

DAM INSPECTION CHECKLIST

To help the dam owner perform periodic safety inspections of the structure, a checklist is provided. Each item of the checklist should be completed. **Repair** is required when obvious problems are observed. **Monitoring** is recommended if there is potential for a problem to occur in the future. **Investigation** is necessary if the reason for the observed problem is not obvious.

A brief description should be made of any noted irregularities, needed maintenance, or problems. Abbreviations and short descriptions are recommended. Space at the bottom of the form should be used for any items not listed.

The following chart may be used as a guide by the dam owner in determining the frequency of inspections for the dam. Each program is dependant on the particular condition of the dam. The Dam Safety Division is available to assist owners in tailoring a program for their facility.

CONSTRUCTION

Modern dams are highly complex and exact structures. From the early dams and their failures, a great deal of knowledge has been gained on the design, construction, and safety of dams. Dams require the art of defensive engineering, which means that a wide range of forces and circumstances must be considered. Each project requires an array of different designs to call on because of: (a) unique site conditions, (b) the particular use of the dam, and (c) the hazards inherent to the particular site.

The necessity for the control of dam construction is obvious because of the potential for damage from failure. A safe and well engineered design may be entirely ruined by careless and shoddy construction. Careful attention to the details of construction is therefore as important as the preliminary investigation and design.

ADMINISTRATIVE

An owner contemplating the construction or repair of a dam must engage the service of a registered engineer. The engineer should be familiar with the State's administrative and technical requirements in order to assure that the dam is properly built or repaired. The Dam Safety Division requires an engineer to be licensed in the State and have prior experience in the design and construction of dams. The engineer is referred to as the Engineer-In-Charge (EIC) and is responsible for seeing the entire project through. Among other things, the EIC is responsible for the following throughout the construction process:

* Submitting periodic reports to the Dam Safety Division,
* Submitting design changes to the Dam Safety Division for approval,
* Certification that the structure is ready for filling, and
* Certification of project completion along with project narrative and "as-built" plans.

Good construction begins with good design. Decisions made during the design process will affect the cost of construction, operation and maintenance cost and, ultimately the life of the structure. Choices that are made on the basis of available funds often result in the dam owner spending additional monies at a later date to correct problems that arise.

There are short term vs. long term trade-offs that are made by the owner and his engineer throughout the design process. During this process it is important that thought be given to unanticipated problems that will arise during construction as well as the need for future operation, and maintenance, and repair. There are several fundamental questions that the engineer should ask himself throughout the design process:

1. Can the structure be built or repairs made with a minimum of effort and cost or does that project involve practices and procedures the contractors are not familiar with?

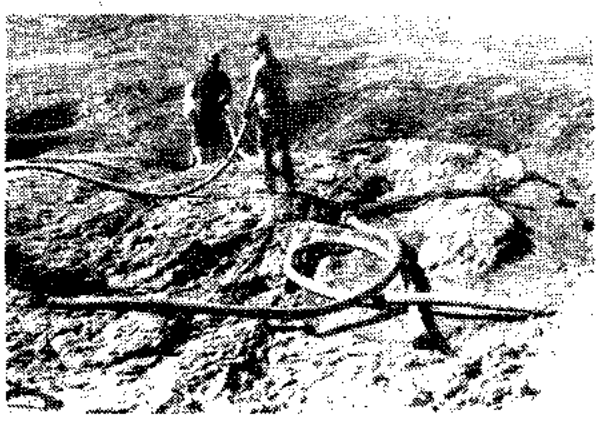
2. Are product materials readily available or must they be custom built for the job?

3. Are functioning parts of the dam (appurtenances) readily accessible for maintenance and repair?

All of these items can contribute not only to the increased cost of the project to the owner but to the long term operation and repair problems of the dam.

Plans and Specifications

Plans and specifications set the standard by which a dam is to be built or modified. Deviations from the standard that is prescribed by the designer will tend to weaken the structure, make it less durable or cause operation and maintenance problems. It is through the use of plans and specifications that the quality of the materials being used are described as well as the level of work quality the contractor must meet in placing the materials in the total structure.



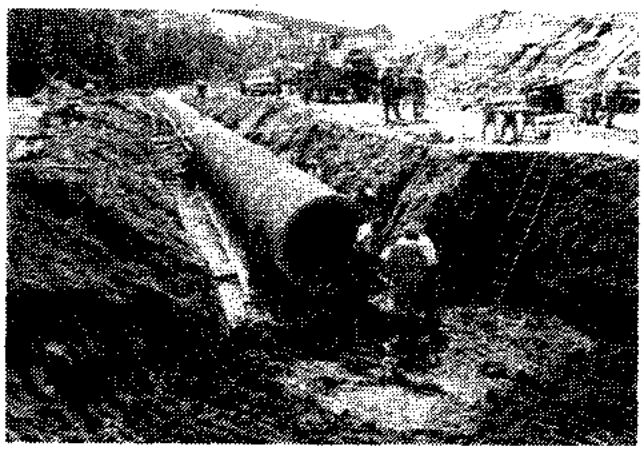
The following is a discussion of typical areas covered by specifications for dams:

Foundation preparation - In order for the dam to be a sound structure it must rest on a solid foundation. Foundation investigations consider the physical features of the site including topography, geology, material availability, and material properties. Specifications for the foundation preparation will address such concerns as:

a. geologic faults,
b. the ability of the foundation material to support the weight of the dam,
c. the control of excessive seepage, and
d. the uniform consolidation of the foundation and fill material.

To address these concerns, specifications may include sections on:

a. removal of unsuitable material,
b. grouting,
c. dental concrete,
d. removal of overhanging or sheer rock surfaces, and
e. core trenches, slurry trenches or other methods of cutting off the excessive seepage of water.

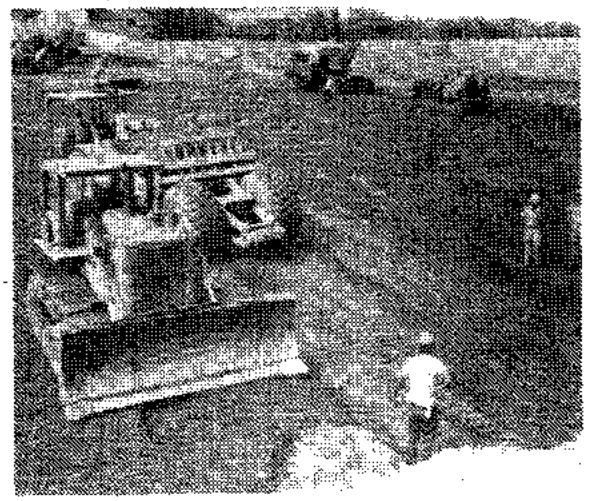


Preparing Rock Foundation

Pipe - Various types of pipe are used for a wide range of purposes in the construction of a dam. Of particular importance are pipes used as principal spillways and any other pipe that goes from the upstream to the downstream side of an earth dam. Pipe is a rigid structure. As such, voids can form around the pipe during consolidation of the embankment. These voids can provide channels for water to escape through the dam, which in turn may cause the dam to fail. For this reason, anti-seep collars are often specified. In addition to conveying water, the pipe must resist the load imposed by the surrounding fill, it must not leak, and joint elongation due to settlement must be accounted for. To accomplish this, pipe specifications will include:

a. size,
b. type,
c. joint design, and
d. load bearing capacity.

The design may include a concrete cradle for additional support. Specifications may also include instructions to the contractor on how to place the pipe and provisions for rejecting damaged pipe.



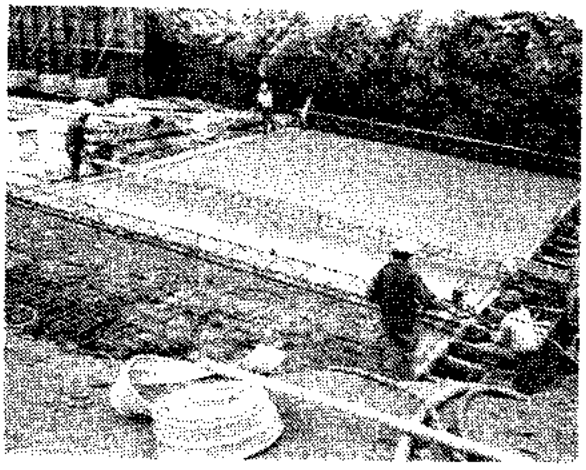
Close Inspection of Installation

Earth and Rock Fill - When a dam is to be built of locally available material, the specifications will address such concerns as: the ability of the embankment to support its own weight under conditions of high water, normal pool and rapid draw down; the degree of consolidation that will occur over time; and, depending upon the availability, a variety of material may be specified to be placed in "zones" of the fill. To address these concerns specifications will include:

a. the grain size distribution of each material to be used,
b. the in-place density of each material,
c. moisture content, and
d. quality of the material in terms contaminants such as organic material.

Specifications may also address how the contractor will do the work by specifying the sequence of construction and type of equipment to be used.

Proper Placement of Embankment Fill



Concrete - Concerns regarding concrete are workability during placement, design strength, appearance of exposed surfaces and durability. To address these concerns specifications for concrete will include;

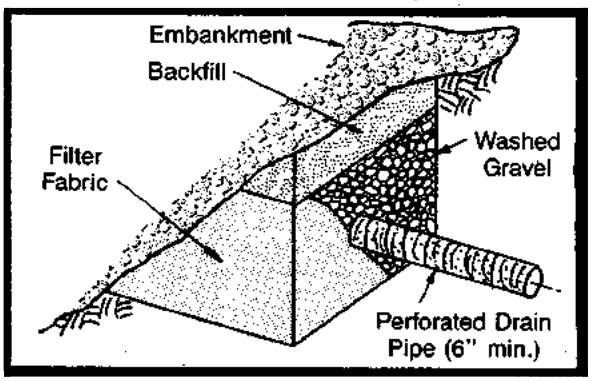
a. design mix (the ratio of cement, sand, coarse aggregate and water) which is frequently provided by the concrete supplier,
b. compressive strength after 28 days of curing,
c. amount of air entrainment,
d. slump,
e. quality of aggregate, and
f. cement type.

Specifications will also include how the

contractor is to perform, including:

a. placement methods (vibrating, limit height of fall, etc.),
b. surface finish,
c. control of cold joints, and
d. repair of faulty areas.

Concrete Pour



Gates and other mechanical equipment- Gates, valves and other mechanical equipment must operate under adverse conditions. Frequently, mechanical equipment is expected to operate after long periods of idleness. This is one area where a little extra money may be well spent on high quality equipment. Specifications for gates include:

a. size,
b. type,
c. material,
d. operating head,
e. size and type of valve stem,
f. size, type and location of stem guides, and
g. size and type of hoist.

Filter drains - Filter drains are placed in earth dams to provide for the safe passage of seepage from the embankment and foundation to the downstream toe of the dam, thereby preventing piping failures, slope failures and wet conditions on the downstream face. Drains must provide voids of sufficient size to provide for free passage of water and at the same time provide voids that are small enough to prevent migration of the finer fill material surrounding the drain. To accomplish this the specifications will include:

a. grain size distribution, and
b. requirements for durability and hardness.

In some cases drains may be constructed as layers of fine material and coarse material. Specifications may also include a filter fabric defining the transmissibility, type of weave and strength.

Riprap - Areas of the dam and exit channel that are subject to damage by wave action and high velocities are most frequently protected by riprap. The ability of riprap to resist erosion is based upon its size and weight. Therefore specifications for riprap will include:

a. size distribution, and
b. durability.

SUPERVISION

The supervision of construction or repair of a dam by a professional engineer is required. The engineer who designed the project is often required to be the EIC because he is the one individual most familiar with the thinking and interpretation of data made during the design process. If unanticipated conditions are encountered during construction, the design engineer is the one best able to make the necessary adjustments in the design.

Construction Inspections

The amount of supervision required of the EIC depends on the size and complexity of the dam to be constructed. In some cases the EIC, with the assistance of a competent inspector, may only have to make periodic visits to the site. In others, the EIC may have to spend full time at the site with the assistance of other engineers and staff inspectors.

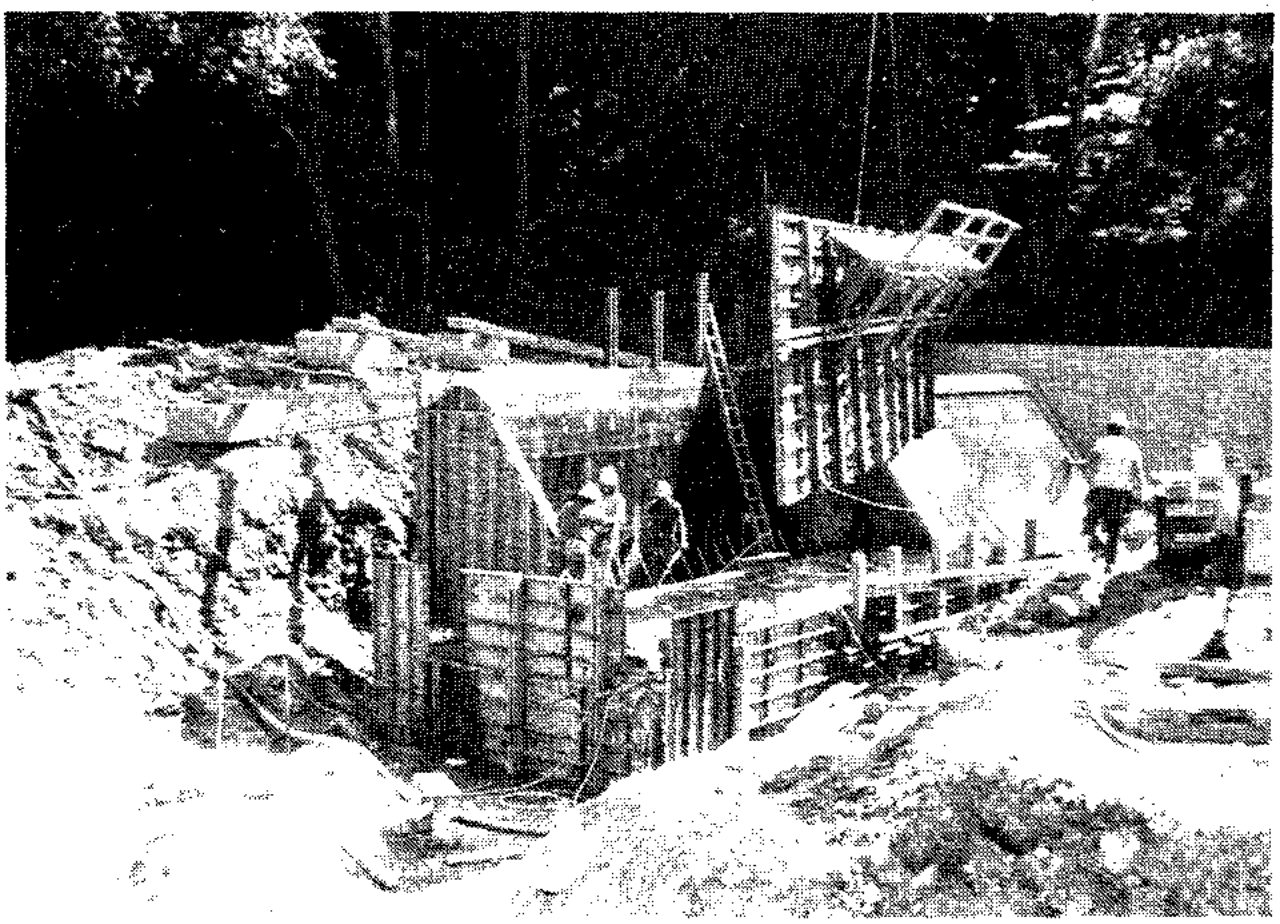
Unanticipated conditions often dictate changes to the plan. These changes must be submitted to the Dam Safety Division for approval prior to the execution of the change. Here is one place where keeping the state field engineer informed can help expedite matters.

The EIC is also responsible for providing to the Dam Safety Division periodic reports that document work progress, problems encountered during construction, and other pertinent information. This report is part of the permit requirements. Upon completion of the project the EIC is responsible for certifying that the project was built in accordance with the plans and specifications. The Dam Safety Division maintains a permanent record of the construction history for future reference. These records are maintained in the event that future structural modifications are required or problems are encountered.

When construction of the dam is substantially complete, contractor or the owner will want to start filling the reservoir. At this time the EIC must prepare a letter stating that the reservoir is ready for filling and request permission from the Dam Safety Division to close the gates. The state field engineer will act on that request.

Within a reasonable period after completion of the dam (usually specified in the permit), a final inspection will be conducted by the EIC, Dam Safety Division and the owner. Thereafter, periodic Operation and Maintenance inspections are required by the owner. The Dam Safety Division will also periodically inspect the structure.

Testing Embankment Compaction



Testing Concrete Quality

State Inspections

Construction progress is closely monitored by a field engineer from the Dam Safety Division. Even though the state representative makes frequent visits to the site, he cannot duplicate or relieve the EIC of his responsibility. The field engineer can provide expeditious handling of temporary permits and requests for modifications to the plans and specifications. Additionally, he can provide an extra pair of eyes in the monitoring of quality control. If the field engineer sees something that appears to be wrong or questionable, he will bring it to the attention of the EIC. The state's field engineer can assist in various decision making processes in order to assure that a safe structure is built.

The best way to work effectively with the field engineer is to keep him advised as to problems encountered and the thought process leading to a solution. That way, when a design change is proposed he can approve it in a timely manner. One very helpful way to keep the field engineer informed is to allow him to participate in progress meetings. Such participation allows him to gain a feeling for the relationships among the EIC, the contractor and the owner.

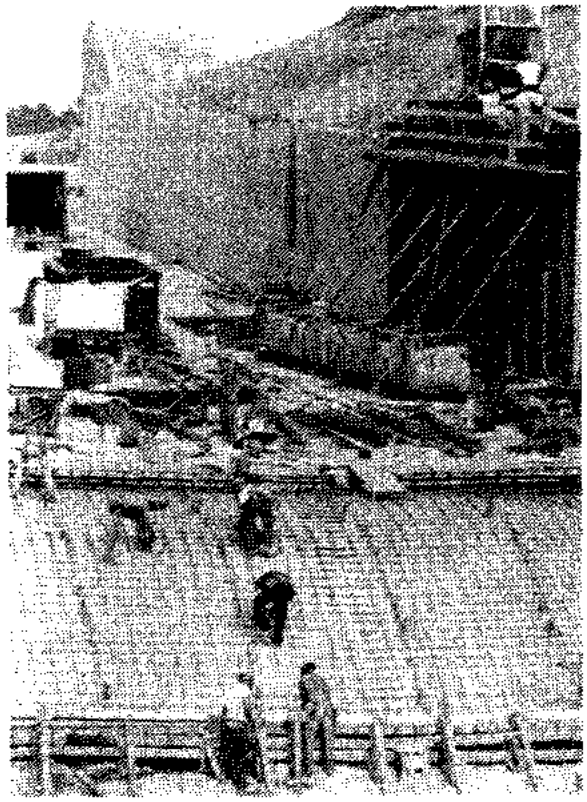
The contractor should be aware of the fact that he must obtain permits for temporary construction which affects the stream (e.g. waterway crossings and stream diversions). Again the state field engineer can help expedite matters if he knows what is going on. The contractor, the owner and the EIC all want a quality job. However, in the unlikely event that it appears that a dam is not being built according to plans and specifications, the Dam Safety Division will take appropriate administrative and legal actions. These may include revoking the permit and ordering the owner to remove the partially completed obstruction.

CONSTRUCTION PROBLEMS

Construction projects are rarely completed without some delay or problem arising throughout the process. If a project is planned, coordinated, and supervised properly, the chance of major problems is minimized. However, there are several problems that occur with some frequency. When these problems develop there are delays that usually result in increased construction costs.

Scheduling

The first of these problems is the sequence of construction. The engineers should anticipate how the contractor is going to build the job and prepare construction plans that can be followed with a minimum amount of diversions, pumping, and other temporary construction. However, the contractor must also put some thought into the sequence of steps he is going to follow in construction of the dam. This is to insure that he has an efficient operation. Additionally, he must be sure he has the right material, equipment and manpower on the job at the right time.



For example, it seems obvious that, in most cases, the outlet works must be completed early in the job, and yet, contractors continually place themselves in the position of having to pour concrete or place gates in the wet. A little forethought would prevent a lot of sand bagging and pumping.

Financial Health

As in any business operation, the contractor's goal is to make money while providing a quality product to his client. Of course, there are justifiable reasons for profit losses on a particular job. However, a contractor that is loosing money on a job may be cause for concern. For these reasons, the contracting process should provide for the elimination of bids that grossly fall short of the engineer's estimated cost. Additionally, throughout the course of the project all parties should periodically meet to discuss all aspects of the job progress. Potential financial problems should be discussed before the quality of the job suffers.

Ordering Supplies & Equipment

One frequent cause of delay is the time required for suppliers to provide mechanical equipment, particularly gates. Ordering mechanical equipment should be done very early in the job. Also, certain types of pipe are special order items. In some instances contractors have found it difficult to find a supplier for a specific product because the order is generally small in quantity.

Proper Scheduling Avoids Delays

Proper Equipment

Having the proper equipment on the job is important. "Making do" often leads to slow production and the correction of inadequate work. The most frequent problems on earth dams, in this regard, are improper or inadequate compaction equipment and a lack of means for providing moisture control.

Natural Hazards

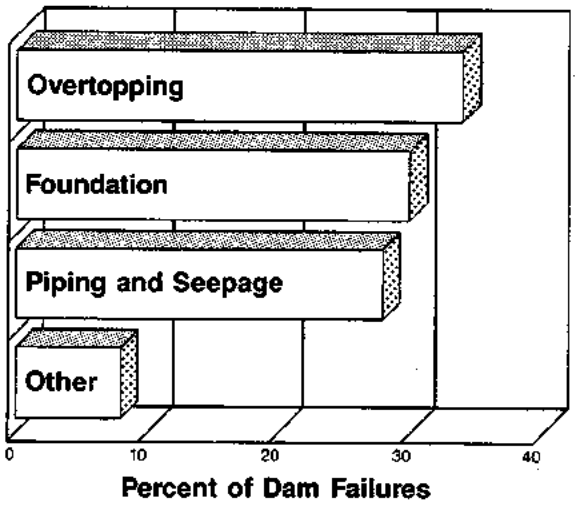
Another problem the contractor must address, especially if it is not considered in the design, is the problem of flooding during construction. At the very least, the contractor should provide for removing equipment to high ground during floods. Other defensive measures may include constructing the upstream portion of the dam to an elevation sufficient to handle frequent events such as a 5 year flood or deliberately leaving a portion of fill low as a "relief plug."

Foul weather will generally upset the construction schedule. Not only can rain shut down a job, but it can cause earth work problems for days. Borrow and fill areas should permitted to drain to avoid saturated material. Cold weather disrupts concrete work and may necessitate costly heating and insulation to protect new pours. Such work is better scheduled in warmer months if possible.

Unapproved Construction

Sometimes, for whatever reason, a contractor will bury work that has not been inspected. If the EIC or his inspector is doing his job, he will require the contractor to uncover the buried work for inspection. The contractor can save himself a lot of grief, expense and delay if he makes sure the inspector is notified of the need for inspection in a timely manner.

Almost all of the above problems can be lumped under the general heading of construction management. Assuming the contract time is realistic, most of the problems that befall a construction job can be avoided by sound management and a cooperative climate between the contractor and the Engineer-In-Charge.



EMERGENCY PROCEDURES

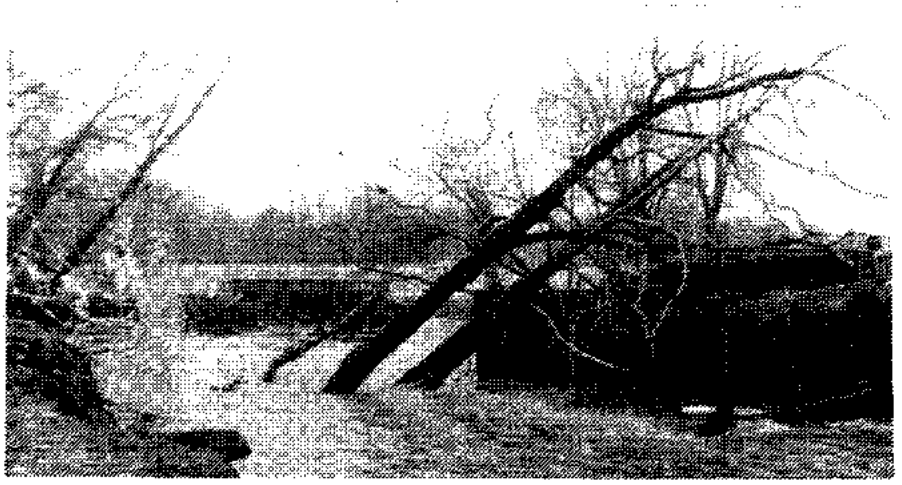
Discussions throughout this manual have concentrated on the safe operation of dams by proper construction, operation and maintenance, and inspection practices. However, the most sophisticated design and construction techniques and a vigorous operation and maintenance program can not prolong the life expectancy of a dam indefinitely. The simple fact is that dams don't last forever. Unforeseen and unanticipated conditions can arise during a dam's existence that can alter the structure's performance and in some instances cause failure.

This section identifies the more common modes of dam failure and how their effects can be mitigated through adequate warning and evacuation planning. Emergency Warning Plans are generally implemented through the local Emergency Management Agency. Included with the discussions is an explanation of the safety hazard classification as it relates to various levels of downstream warning procedures.

TYPES OF FAILURES

In today's technical world, dam failures are rated as a "low probability-high loss" event. However, dams are subject to many forces that can cause failure. A number of studies have been made and suggest the following causes of dam failures:

Because dam failures can result from various conditions, a periodic review of all facets of a dam is necessary.



The majority of Maryland dams (75%) are constructed of earth. Therefore, the main discussion of failure types in this section is limited to embankment dams. However, the failures that will be described can be attributed to gravity, buttress, and other types of dams as well.

Overtopping Failures

Overtopping is the most common mode of failure with regard to earth dams and is the result of the structure's inability to safely discharge significant inflows to the reservoir. This causes uncontrolled water to flow over and around the embankment, eroding portions of the dam. Since earth structures are usually not designed to be overtopped, the

Earth dam in poor shape. Inadequate spillway capacity, tree growth, and weak embankment soils are causes for concern.

1 month later - The poor condition of the dam was no match for the heavy rains that overtopped the crest and caused failure.

erosion process begins as soon as water flows over the dam. Inadequate spillway capacity usually causes the overtopping of earth dams and will often lead to a complete breach of the dam. This mode of failure can also be caused by debris accumulation in appurtenances such as the riser and barrel structure or the emergency spillway.

One aspect of overtopping that an earth dam owner should be aware of is the concentration of flow. Where pedestrian paths or poorly maintained vegetative cover have created depressions or low spots along the crest, water will concentrate when overtopping begins, accelerating the erosion process. This problem can be corrected by keeping the dam crest level. Low spots should be filled and adequate vegetation established.

Methods of mitigating the effects of overtopping include providing for adequate spillway capacity or lowering the reservoir pool when flooding is anticipated. Temporary sandbagging can be used to prevent overtopping of the dam crest during a flood. Caution should be used when sandbagging, not only for safety reasons but also because additional water is impounded that could be released should the dam fail. Keeping the spillways free of debris and maintaining a level dam crest is helpful in deterring the effects of overtopping and should be part of the dam owner's regular operation and maintenance activities.

Piping and Seepage Failures

All dams have some quantity of seepage. Methods exist to control and convey seepage safely through the dam. When the volume of seepage exceeds the capacity of the dam's internal drainage system, problems will develop and can eventually cause partial or complete failure of the structure. Uncontrolled seepage can progressively erode portions of the embankment or foundation and cause an internal erosion or "piping" failure of the dam.

Once the "piping" of a dam progresses beyond a certain point it is virtually impossible to stop. Usually signs of uncontrolled seepage indicate a problem exists long before the structural integrity of the dam it threatened. Therefore regular and routine inspection of known seepage areas is essential. Should seepage increase significantly over what is normally observed or the seepage discharge suddenly becomes discolored or muddy, then a professional engineer should be contacted immediately and the Dam Safety Division notified.

Actions taken to delay or prevent complete failure of the dam when "piping" of the embankment has begun include: lowering the pool until the seepage problem has been corrected, covering the seepage area downstream with sand and gravel to prevent erosion of the embankment material, and, should the "pipe" progress to the upstream slope, attempt to plug the upstream end of the "pipe" with gravel, earth, straw or some other suitable material.

Structural Failures

Structural failures can occur in the embankment portion of a dam or its appurtenant structures. Embankment failures are typified by major differential settlement, cracks, or slumps in either the upstream or downstream slopes. These conditions, if left unattended, can lead to complete failure of the dam. They are generally preceded by less severe conditions that indicate a problem exists. Therefore, the point of regular and routine inspections cannot be overemphasized.

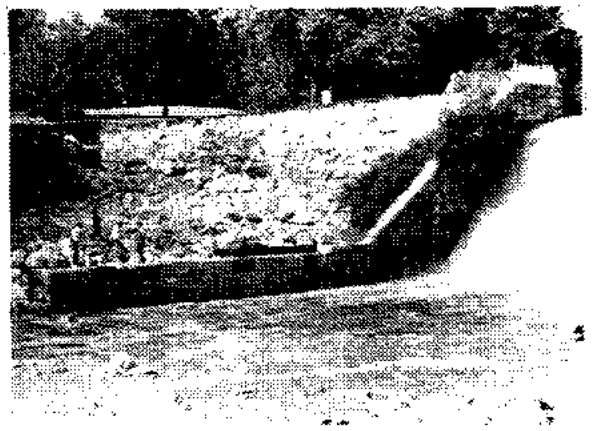
Cracks and major settlement in appurtenances can also cause dam failure. Settlement in an outlet pipe can result in loss of embankment material through an open construction joint and eventually lead to failure. Undermining of the pipe's outfall can reduce the conduit's support and cause partial failure of the principal spillway system. Again, these conditions usually do not happen overnight and can be detected long before failure occurs.

Maryland Dam Failures

It is believed that no lives have been lost in Maryland as a direct result of dam failure. However, we have not been without incident. Several dams have partially or completely failed due to various conditions that include: excessive rainfall, structural failures, and failure during

Several dams have partially or completely failed due to various conditions that include: excessive rainfall, structural failures, and failure during construction. Some examples follow that will describe the more recent dam failures.

Lake Waterford Dam



The Lake Waterford Dam is the focal point of a recreational park in Anne Arundel County. The dam, on the Magothy River, is fifteen feet high, 250 feet long, and has an overflow spillway ten feet wide. Believed to have been purchased from a private mill operator in 1925, this earth structure was overtopped and partially failed during Tropical Storm David in September, 1979. An inspection of the dam three months prior to failure revealed sparse vegetation and erosion gullies caused by pedestrian traffic on the crest and downstream slope. The inspection report stated that "In the event of overtopping of the embankment during major storm events, these gullies would be preferential flow paths, susceptible to rapid erosion and could possibly lead to failure of the dam." When overtopping did occur, water flowing in these gullies eroded portions of the embankment to the right of the overflow spillway exposing a concrete core wall.

The Lake Waterford Dam was repaired in 1993. A new principal pipe spillway along with a concrete ogee spillway were installed to safely pass the 100-year storm. In addition a cement bentonite slurry wall was installed and a fish passage was constructed to access the upstream spawning areas.

Lake Roland Dam

The Lake Roland Dam, on the Jones Falls in Baltimore County, has experienced significant structural damages in recent years. This structure, completed in 1861 to supply Baltimore City with water, is an earth and rockfill gravity dam 31 feet high, 310 feet long, and has a 120 foot wide uncontrolled ogee spillway. Lake Roland was retired as a water supplier around 1915 and has been used as a recreational facility since then. Inadequate spillway capacity led to two partial failures during Tropical Storms Agnes in 1972 and David in 1979. Overtopping of the right non-overflow portion of the dam during both storms resulted in erosion of the earth and rockfill, exposing the marble stone block wall. Subsequent repairs involved replacing backfill material consisting of soil and riprap that was surface grouted with mortar.

As of May 1993, the repair of Lake Roland Dam has begun and is scheduled to be completed by the end of 1993. The repairs include enlarging the principal spillway to 170 and construction of two auxillary spillways located on the old abutments. The modifications will enable the dam to safely pass over 90% of the PMF.

Severe Abutment Washout

Loveton

The Loveton Farms Stormwater Management facility is a "dry" pond in Baltimore County. It is a 20-foot high earth dam with a 78-inch diameter corrugated metal pipe spillway conduit. Completed in 1985, it failed by piping during heavy rains in 1989 causing extensive environmental damage. It was rebuilt in 1990.

A review of construction records after failure showed that the pipe was installed in a trench cut through the partially completed embankment fill. It is likely that piping was inititiated by seepage through transverse cracks that formed in the fill due to differential settlement. Other possible causes of failure are: improper compaction under the haunches of the pipe and joints that were not watertight.

HAZARD CLASSIFICATION

Dams are generally classified into usage categories according to their intended function, such as water supply, flood control, or recreation. The Maryland Dam Safety Division also categorizes dams according to their size and potential downstream hazard. Dams are classified as: **high hazard** (Class 1) where loss of life and extensive property damage are probable should the dam fail, **significant hazard** (Class 2) where failure would cause extensive damage to public or private property but the loss of life is very unlikely, and **low hazard** (Class 3) where failure would not cause the loss of life and the damage is within the financial capability of the owner to repair.

The hazard classification of a proposed dam is also used to determine the inflow design flood and the spillway characteristics of the dam itself. Detailed instructions to classifying a Maryland dam can be found in the Rules and Regulations governing Waterway Construction (COMAR 08.05.03.05.).

The National Dam Inspection Program took place between 1978 and 1981. The inventory survey indicated that 68,153 non-federal dams existed nationwide. During the inspection program, U.S. Army Corps of Engineers guidelines were used to assess the downstream hazard characteristics for the dams. The Corps used a system of three terms: high, significant, and low to describe a particular dam's hazard potential with regard to loss of life. No consideration was given to the condition or structural integrity of the dam. It was determined that approximately 13% of the nation's dams were classified as high hazard. Of the nation's high hazard dams, Maryland is responsible for less than 1%.

Danger Reach

In order to mitigate the downstream effects of a dam failure, the area of potential flooding must be known. The "danger reach" below a dam is defined as the area that would be inundated by a flood caused by the sudden release of stored water behind the dam that exceeds the expected amount of flooding had the dam not existed. By identifying those structures affected by the failure of a dam, the owner can determine the amount of warning required to protect those structures. For example, the owner of a Class 2 dam identifies three bridge crossings downstream that would be overtopped from excessive discharge from his dam. From that determination, procedures to prevent vehicle use of those bridges during anticipated high flows or failure can be develop. A Class 3 dam owner, having no permanent structures in the downstream danger reach, may want to warn his neighbor of high discharges caused by a problem at his dam so the neighbor can take necessary precautions (e.g. remove farm equipment and livestock from the downstream area.)

Warning procedures will be more sophisticated for Class 1 dams, but the owners of the less hazardous structures should not discount the necessity of warning downstream interests. Downstream development is another factor that must be considered when proposing a new dam. A dam, for instance, built 30 years ago and designated as a low hazard, Class 3 structure can easily become reclassed as a high hazard dam if development downstream is allowed within the danger reach. The reclassification of a dam to a higher category results in more conservative design parameters. For this reason the dam owner should consider upgrading the structure to provide additional freeboard or spillway capacity.

The danger reach for most of the high hazard dams in Maryland has been defined and can be obtained from the Maryland Dam Safety Division. This information is also available for some of the Class 2 and 3 dams. The ultimate responsibility for implementation of a warning plan that includes the danger reach rests with the dam owner.

EMERGENCY WARNING PLANS

Adequate warning and evacuation planning can prevent extensive property damage and loss of life should the dam fail. An **Emergency Warning Plan** is a non-structural method used to mitigate the effects of dam failure. The Emergency Warning Plan for a dam is based upon the potential for downstream flooding. Every dam owner should have one.

Maryland regulations require an Emergency Warning Plan for all proposed dams that are designated as Class 1 or Class 2 structures. Owners of existing Category 1 dams that were inspected under the Corps of Engineers National Dam Inspection Program were advised to develop a formal flood surveillance and warning plan to protect downstream interests.

Components of a Warning Plan

Much literature is available on the subject of warning systems. Depending on the size of a dam, the warning plan can range from a simple, one page telephone notification list to a sophisticated, telemetered network involving several major public agencies (e.g. - Civil Defense, Police, Fire and Rescue, etc.). Whatever level of warning is determined adequate, the Emergency Warning Plan must accomplish its intended goal: reducing the chance for loss of life and extensive property damage. Warning plans that are too voluminous will not be effective during emergencies if the involved agencies are not familiar with the procedures. Regardless of the size of the dam, an adequate Emergency Warning Plan possesses certain key elements that will ensure effective response. They are:

Surveillance and Mitigation
Communication and Notification
Evacuation

All involved parties should be familiar with the Emergency Warning Plan. The plan should be exercised and updated periodically by verifying personnel responsibilities and phone numbers.

Surveillance and Mitigation

This component of the warning plan is the most important because it identifies any problem that exists at the dam. Through the regular operation, maintenance, and periodic inspection of the dam, the owner should be well aware of problems associated with the structure. Therefore, rapid change in the "normal" condition of the dam should indicate that a problem exists and should be investigated thoroughly with continuous surveillance of the problem if warranted.
Also, advising various agencies that a potential problem exists and corrective action or possibly evacuation maybe required.

If it is known that a particular dam has inadequate spillway capacity and weather forecasters are predicting unusually high rainfall, the owner should maintain constant watch on his structure to insure adequate operation of the dam. Items of importance in this instance are the reservoir level, the rate of pool rise, excessive seepage, debris accumulation in the spillways, and any unusual observations. If the embankment is in danger of being overtopped then the previously discussed procedures for mitigation can be implemented (e.g. sandbagging, lowering the reservoir, etc.).

If time permits, a professional engineer experienced in dam design and operation should be consulted to determine the extent of the problem and assist in deciding whether emergency procedures should be initiated. Local public safety officials like the Civil Defense and Police should be alerted and kept apprised of the situation. Above all, surveillance in times of dam distress should be constant. At unmanned structures, provisions should be included to provide for surveillance of the structure, and travel time will need to be included in the warning plan. Constant communication between the dam owner and those agencies responsible for evacuation is essential. Surveillance should be maintained throughout the emergency and until the decision is made to resume normal operating procedures.

Communication and Notification

Once an emergency has been identified at a dam, communication and notification of

individuals and agencies responsible for various tasks is essential to protect life and property downstream. Communication links should be established immediately with those agencies who would provide for the public safety. Normally this link between the dam owner and the public can be established through the local Civil Defense Agency or Emergency Management Office in that particular jurisdiction. The local Civil Defense office has the communications expertise to alert the appropriate agencies so timely action can eventually save lives and property. Civil Defense can, in effect, act as the center for disbursing information to the police, fire and rescue, Red Cross, and the public regarding a developing emergency. It is therefore essential that constant dialogue be maintained with Civil Defense so information can be relayed.

It is prudent to include involved agencies when a warning plan is being developed. For example, if after initial discussions between the dam owner and the local Civil Defense it is determined that the police and fire department will be needed to block roadways and assist in evacuation activities, subsequent meetings should include those agencies to insure that their responsibilities are understood. Once the communications network, including backup, is established, a notification list can be formulated and distributed so all involved individuals understand what is expected of them.

A warning plan also needs to address when and how an emergency is to be terminated and what methods will be used to assure limited access and security in the danger reach. Agreement between involved individuals will dictate termination of an emergency both at the dam and in the downstream areas. Similar methods for evacuation can be used for terminating an emergency. However, all agencies should be involved with the decision.

Evacuation

If it should become necessary to evacuate a portion of a downstream community in the event of dam failure, several items need to be considered.

WHEN is evacuation warranted? Determinations regarding the stability of a dam should be made by an engineer experienced in dam design and operation. Certainly the order to evacuate should not be given if it is not warranted. However, the time involved for failure to occur often governs evacuation procedures. Provisions in a warning plan should account for failure that occurs over an extended period of time (overtopping) and one that occurs almost instantaneously (piping). Also, dams do not always fail between the hours 9 to 5, Monday through Friday. Provisions need to be included for evening and holiday emergencies.

WHO will be evacuated? As discussed above, all dam owners should be well aware of their structure's hazard potential. Danger reach and inundation information should be developed in order to identify those properties and people at risk. The size of the danger reach often determines evacuation procedures. Isolated dams with more than a small number of inhabitable structures will be treated differently than larger dams in major metropolitan areas.

HOW will evacuation occur? Alerting the downstream residents can be accomplished many ways. Methods should be used that are commensurate with the magnitude of evacuees. "Door to Door" evacuation will suffice in isolated areas if time permits but not in more populated areas. Radio and television can be utilized effectively as well as bullhorns or automated sirens. Choose the method best suited for the job at hand.

WHERE will evacuees go? Various civic agencies can assist with housing evacuated individuals. Shelters can be established in most areas and the Civil Defense and Red Cross should be able to assist with relocation.

A sample Emergency Warning Plan is shown on the following pages.

Introduction

The purpose of the Emergency Warning Plan is to facilitate the evacuation of downstream residents if there is the possibility of dam failure. The establishment of an effective plan is an essential part of an impounding structure's operation program. Any plan drawn up by the dam owner is subject to review by the local Civil Defense Agency and the Dam Safety Division of the Water Management Administration.

An Emergency Warning Plan is fairly simple to formulate and will be very valuable if ever needed. An effective Plan incorporates several essential elements.

Surveillance

I. **Adverse Conditions:** When a flood watch or flood warning is issued by the National Weather Service, water levels are recorded and spillways, seepage zones, and discharge water levels are inspected.

1. Continuously monitor and record water levels in the reservoir.

2. Open gates or drains if necessary to lower the reservoir pool and provide additional flood storage.

II. **Standby Alert:** According to specific on site conditions at the dam; such as depth of spillway flows, cracking, seepage, piping, etc.

1. Constant surveillance by on site personnel.

2. Initial notification of Agencies to advise of status at site.

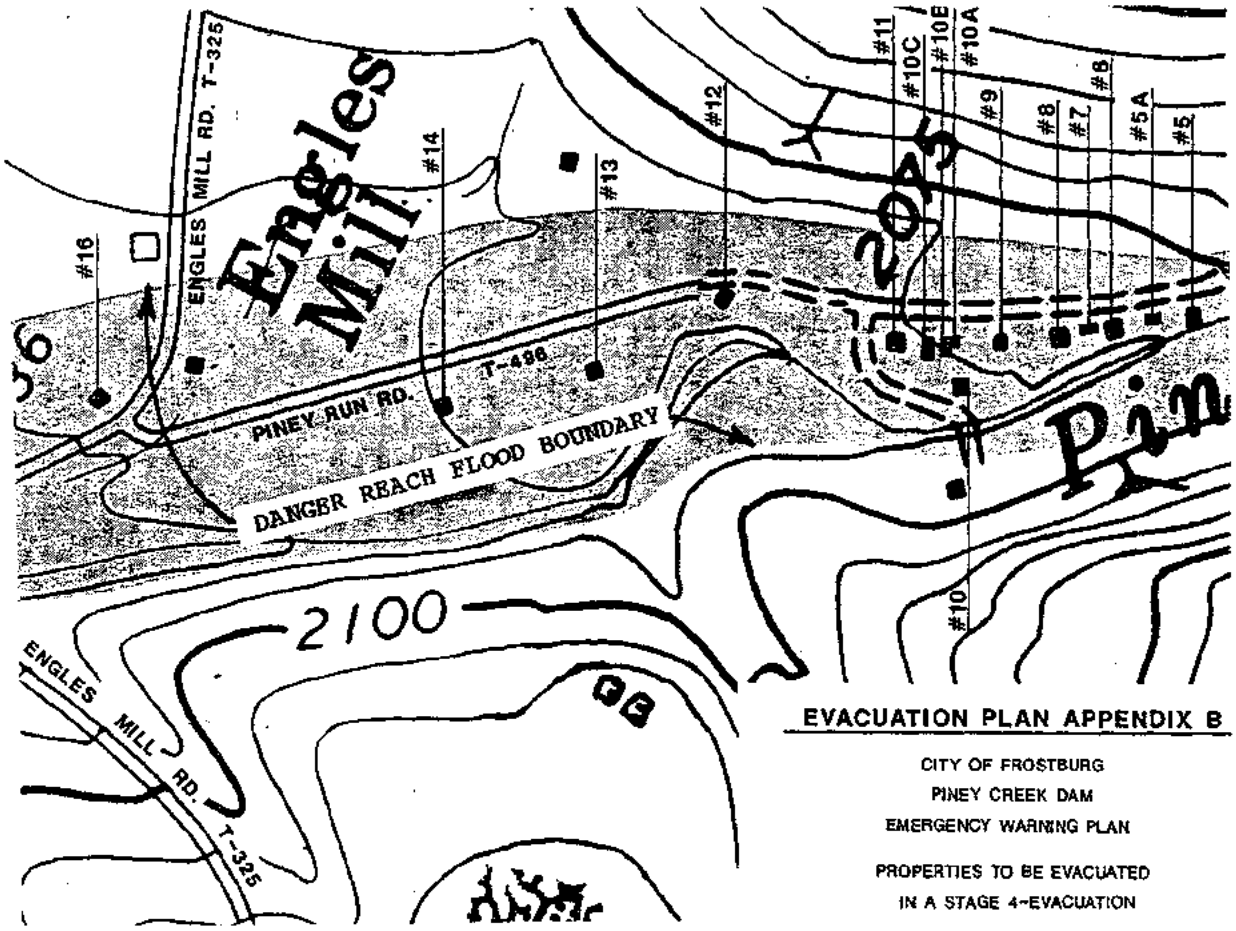
Notification

I. **Adverse Conditions:** Communicate data gathered by observers to the dam operator at appropriate intervals. The dam operator shall take the information and make judgement decisions.

II. **Standby Alert:** Proper authorities are notified of the need to initiate the warning plan or evacuation plan. This can be by telephone, ham radio, CB radio, or police, fire, and other emergency radio systems. It is important that any system chosen have an emergency backup. The Civil Defense Director shall notify: the mayor, police chief, fire chief, city manager, and the public.

Evacuation

Evacuation procedures may include any number of site specific measures such as evacuation of houses within so many vertical feet of a highway, or everyone down to a certain point. These details must be worked out in advance with cooperation between the local Office of Emergency Services. A narrative of these procedures should appear in this section in accordance with the county emergency operations plan. Evacuation areas and location of evacuation receiving centers must be shown on a map attached to this plan.



Post Evacuation

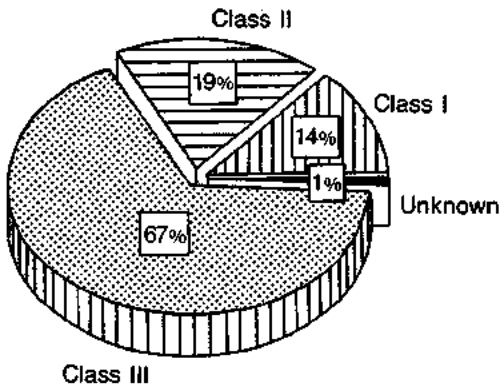
Should the Civil Defense Director decide that the emergency condition has passed, the evacuation order shall be cancelled. State dam safety officials shall be alerted and should inspect the facility.

Plan Review

Periodic verification must be made to confirm that the Emergency Warning Plan is adequate. Communication checks, drills, and map up-dates are necessary. An annual review and update is essential to maintain an effective plan.

Evacuation Map

FEDERAL LEGISLATION



As a result of several dam failures in the United States in the early 1970's, the National Dam Inspection Act of 1972 (Public Law 92-367) was quickly enacted and signed by President Nixon on August 8, 1972. The Secretary of the Army, acting through the Corps of Engineers, was to carry out a national program to inventory and inspect non-federal dams "for the purpose of protecting human life and property." The activities to be carried out under P.L. 92-367 included the inspection of dams posing a threat to human life or property that were 25 feet or more in height or impounded 50 acre-feet or more at maximum water storage elevation. The Secretary of the Army was to report the findings these inspections to the governor of the state in which these dams were located along with recommendations to correct any deficiencies found.

Funding for P.L. 92-367 was limited by Congress and therefore the majority of effort was concentrated on developing a national inventory of dams. By 1975, a total of 49,322 structures comprised the National Dam Inventory.

Dam safety in the United States was given a significant boost in late 1977 in response to renewed public awareness stemming from additional catastrophic dam failures. One of these failures occurred on November 6, 1977 in then President Carter's home state of Georgia. The Kelly Barnes Dam failed, following several days of heavy rain, killing 39 people at a downstream bible college near Toccoa Falls in the northeastern part of the state.

The failure of the Kelly Barnes dam prompted the President, with Congressional appropriations of $15 million in 1978, to direct the Secretary of the Army to immediately begin the inspection of some 9,000 "high" hazard non-federal dams. Funding prior to the December, 1977 "Public Works Appropriation Act" (P.L. 95-96) had been denied by the Office of Management and Budget who observed that such inspections of non-federal dams were the responsibility of the particular states and should be accomplished as part of their normal responsibilities. P.L. 95-96 thus started the four year National Dam Inspection Program.

By the end of 1979 the inspection program was well under way and a total of 4565 high hazard dams had been evaluated. It was determined that 1334 (29%) of the inspected dams were found to be "unsafe". Of these dams it was determined that 5% were found to be in an "emergency" situation, requiring immediate corrective action. The balance of the "unsafe" dams were so designated primarily because of inadequate spillway capacity.

Non-Federal Dams
Hazard Classification

In 1979 the responsibility for coordinating non-federal dam safety shifted from the U.S. Corps of Engineers to the Federal Emergency Management Agency (FEMA). FEMA has the responsibility to coordinate the efforts of other federal agencies to implement the Federal Guidelines for Dam Safety. FEMA's current objectives for non-federal dam safety are to:

Assist each state in implementing an effective dam safety program.

Develop public awareness and support

dam safety programs.

Utilize the Interagency Committee on Dam Safety (ICODS) and other federal organizations to develop technical assistance materials for dam safety programs.

To date FEMA has encouraged additional research of dam safety including: funding for repairs, risk analysis, and status updates of the States Dam Safety Programs.

With the assistance and support from FEMA, the Association of State Dam Safety Officials (ASDSO) was formed in 1984. The purpose of the association is to further the safety of non-federal dams and provide a forum for the exchange of ideas and experiences of dam safety issues. The main objectives of the Association are:

Provide information and assistance to state dam safety programs.

Foster interstate cooperation.

Improve efficiency and effectiveness of state dam safety programs.

The Association has been responsible for attracting over 1,600 members including the 50 states. Numerous municipalities, corporations, and individuals have also become members of ASDSO. Support and encouragement of State Dam Safety Programs is provided with the Publication of a quarterly newsletter concerning dam safety. ASDSO also is responsible for:

Assisting states by providing funding and technical assistance towards holding public awareness workshops.

Publication of a Model State Dam Safety Program.

Development of a methodology for maintaining National Dam Inventory.

Offering Regional Technical Services to state dam safety engineers.

Holding an annual ASDSO Dam Safety Conference.

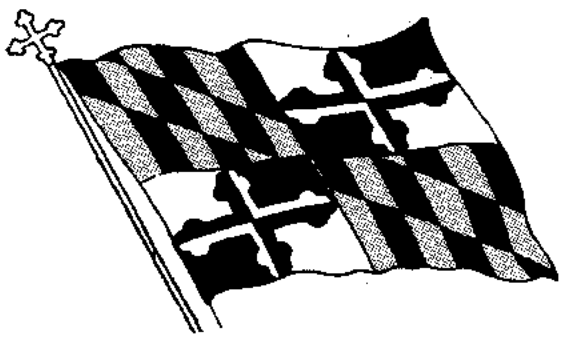
Establishing a Dam Performance Library at Stanford University.

Periodic updating of the national dam inventory which lists 74,464 total non federal dams. The inventory also indicates that high hazard dams represent approximately 9% of the nations total non-federal dams.

Even with the increased emphasis on dam safety nearly 1,915 non federal dams remain unsafe today (ASDSO, 1996).

The most recent federal legislation concerning dam safety was enacted with the passage of Public Law 99-662. Title XII of this law, known as the Dam Safety Act of 1986, includes provisions for:

a) encouragement and assistance in the development of State Dam Safety Programs;



b) establishes a National Dam Safety Review Board;

c) authorizes a program of research into innovative dam safety inspection techniques.

At this time the proposed fiscal budget only includes provisions for the maintenance of a National Dam Inventory only.

MARYLAND LEGISLATION

Maryland recognized the need to regulate the water resources of the State as early as 1931 with the creation of the first "Water Resources Commission of Maryland." Chapter 247 of the Annotated Code of Maryland, enacted on June 1, 1931, authorized the Governor of the State "to appoint a commission of seven persons to review the underground and surface water resources of the State of Maryland in order to determine the most effective plan to preserve and allocate such water supply resources for maximum public benefit and use."

Water Resources Commission

This Commission was charged with the responsibility of developing programs to: measure stream flow; supervise the location, design, and construction of water supply dams and reservoirs; improve rivers of the state to prevent damaging floods; control public water supplies; regulate stream flows by storage reservoirs; and evaluate the necessity for creating water districts. By this Act the Commission was also to present a written report of its findings and recommendations to the General Assembly of 1933 with regard to policy, legislation, and methods of financing.

The Commission submitted its final report to the General Assembly in January 1933, and recommended that, since Maryland had no agency to review the design of dams and had no specific policies with regard to stream gaging, stream discharge regulations, and conservation of water supply uses, there should be created a permanent Water Resources Commission of Maryland. This permanent body would formulate water conservation policies, and provide for continuity of stream gaging and for the supervision of dams.

From those recommendations made by the initial Water Resources Commission, the 1933 State Legislature established Maryland's first comprehensive water resources authority by the approval of Chapter 526 of the Annotated Code. This Act provided for the control of appropriation and use of the state's surface and underground water. Chapter 526 established the Water Resources Commission as a permanent regulatory authority empowered to control the construction and repair of dams, devise a general water conservation program, provide public hearings for permit applications to appropriate state waters, and provide for appeals and penalties for violations of its orders.

Permit Authority Created

Aside from establishing the first permanent regulatory agency for Maryland's water resources, Chapter 526 created permit requirements for the use of State water. Therefore, from January 1, 1934 it became unlawful to use or appropriate any waters of Maryland without written consent of the Water Resources Commission. Plans, drawings, and specifications would be required for projects that "in any manner change or diminish the course, current, or cross-section of any stream or body of water". Chapter 526 also provided for public hearings to give affected individuals the opportunity to voice opinions both for and against the granting of a permit.

Also established in 1933 was the first authority for enforcement type action that could be exercised by the Water Resources Commission. The Commission was given the authority to require the owner of a reservoir, dam, or waterway obstruction to remove or repair said structure should it be

determined by outside complaint or investigation that a particular pre-existing or proposed project was judged to be unsafe.

Exclusions from the permit requirement were also provided for in Chapter 526. Structures built before January 1, 1934, as well as those water uses involving domestic and farming purposes, were not required to obtain a permit. Structures ten feet or less in height above the stream were exempt and dams impounding less than one million gallons were also not required to obtain a permit.

The basic legislative intent of the 1933 legislature has remained virtually unchanged through thirteen modifications to the original law. These modifications merely adjusted the exlusionary limits that required written approval from the Water Resources Commission. The following describes those law changes and some of the basic restructuring of the Commission's organization that has taken place since in 1933:

YEAR	LEGISLATION	COMMENTS
1931	Chapter 247, Annotated Code of Maryland	Commission created to investigate a plan to preserve and allocate the water resources of the State.
1933	Chapter 526, Annotated Code of Maryland	Permanent Water Resources Commission established and given regulatory authority.
1939	Article 96B enacted	Chapter 526 renamed to Article 96B
1941	Chapter 508 repealed and reenacted with ammendments as Sections of Article 96B	Creation of "The Board of Natural Resources." Changed all references of the Water Resources Commission to the Department of Geology, Mines and Water Resources.
1950	Chapter 72 repealed and reenacted as Section 5 of Article 96B	Permit exemption provisions were expanded to include muskrat ponds and farm ponds. A farm pond was defined as an all earth dam and spillway impounding nine or less feet, having a surface area of 60,000 square feet, and a contributory drainage area of less than 100 acres. Ponds were not to be built "closer than 500 feet to a place for human habitation or public road."
1951	Article 66C enacted	Previous legislation renamed to Article 66C
1957	Chapter 317 repealed and reenacted as Section 669 of Article 66C	Farm ponds were qualified and expanded to include ponds having a surface area of less than five acres or a depth of water of fifteen feet at the spillway level. Geographical drainage area limitations were added. Ponds exempt would not exceed 400 acres north and west of the B and O Railroad and 700 acres south and east of the B and O Railroad. Some offstream impoundments were also exempt. Some design considerations were also included with regard to minimum freeboard and allowable emergency spillway velocities.
1962	Chapter 18 repealed and reenacted as Section 721 of Article 66C	Waste stabilization lagoons under permit with the Maryland Department of Health and Mental Hygiene were added as exemptions.
1963	Chapter 611 repealed and reenacted as Section 721 of Article 66C	Exemptions for muskrat ponds were qualified to include structures that were less than "four feet in height" and for the propagation of "other wildlife species."
1964	Chapter 73 repealed and reenacted as Sections 15, 16, and 17 of Article 66C	Split Department of Geology, Mines and Water Resources into separate agencies. Created the Department of Water Resources that assumed water related duties.

1965	Chapter 752 repealed and re-enacted as Section 12 of Article 96A	Recreation ponds were added to the exemption list. Requirements of a drop inlet pipe or other mechanical spillway were established for dams draining greater than 5 acres. A minimum freeboard requirement of 1 foot was included and the normal surface area of 5 acres for farm ponds was changed to 12 acres.
1967	Chapter 416 repealed and re-enacted as Section 12 of Article 96A	This act exempted drainage systems built exclusively for the collection, conveyance, or disposal of storm water.
1972	Chapter 521 repealed and re-enacted as Section 12 of Article 96A	Deleted all previously mentioned permit exemptions (farm ponds, muskrat, sewage lagoons, storm water structures, and all size restrictions) and redefined those dams not requiring Administration approval. This exempted small ponds having a contributory drainage area of less than 1 square mile and a normal depth of water less than 15 feet and a normal surface area of less than 12 acres (approval from the Soil Conservation District was required).
1973	Recodification and renumbering as Title 8 of the Natural Resources Article	Restructuring of Departments and the creation of the Department of Natural Resources and the present Water Resources Administration.
1978	Amendments to Natural Resources Article 8-809	Provisions to allow the Department to investigate unsafe dams and repair them if necessary.
1991	Amendments to Natural Resources Article 8-806	Provided for a public informational hearing upon written request, notification of contiguous property owners and written notification of the Department's decision to interested persons. Also provided for requirements to obtain a contested case hearing if aggrieved by Department's decision.
1992	Amendments to Natural Resources Article 8-803(b)	Redefined the "small pond exemption" to be: 1) less than 640 acre drainage area; 2) less than 20 feet in height (measured from the top of the dam to downstream toe); and 3) low hazard structure.
1995	Recodification and renumbering as Title 5 of the Environment Article	Transferred regulatory functions from the Department of Natural Resources to the Department of the Environment.

Present Regulatory Authority

The Maryland General Assembly gives state agencies the authority to promulgate regulations in order to supplement and clarify existing laws. These regulations are found in the Code of Maryland Regulations (COMAR) under Construction on Non-Tidal Waters and Floodplains. The Water Resources Administration has rules and regulations that govern the construction, reconstruction, repair, or alteration of a dam.

Dams and reservoirs are the most stringently regulated of all waterway construction projects. Because of the complexity and cost involved in undertaking this type of project, the Water Resources Administration provides for a two step permit process. The main advantage of this process is that many of the detailed construction plans and specifications for the dam need not be prepared until after a ruling has been made on whether the overall project is in the best interests of the State's Water Resources. The permit and construction process for a new structure can be divided into the following major steps:

1. **Classification of Dam and approval of Engineer-In-Charge**

2. **Plan Development Permit**
   feasibility report
   environmental considerations
   general location and features of dam

3. **Opportunity for Hearing Process**
   public input

4. **Obstruction Permit**
   plans and specifications approval
   operation and maintenance program

5. **Construction of Dam**
   material tests
   construction reports
   design changes
   certification of readiness for filling
   "as built" plans

The Dam Safety Division requires that a registered professional engineer supervise the design and construction of new dams as well as major repairs to existing facilities.

The Engineer-In-Charge is encouraged to serve as the construction manager since he or she is the one person who is keenly aware of the design details. As stated throughout this manual, the overall safety and longevity of the dam is contingent on many factors. The best design program will only serve its purpose if a well prepared construction program is adhered to.

The regulations are intended to provide assistance and guidance in preparing new projects or undertaking major repair to existing facilities.

GLOSSARY

ABUTMENT - That part of the valley side against which the dam is constructed See also Left Abutment and Right Abutment.

ANTI-SEEP COLLAR - A projecting collar built around the outside of a tunnel or conduit to reduce the seepage along the outer surface of the conduit. Filter diaphrams are preferred over antiseep collars.

APPURTENANCES - The associated works of a dam other than the embankment or main impoundment structure, such as the outlet, spillway, outlet conduit, and tunnels.

AS-BUILT DRAWINGS - Plans or drawings portraying the actual dimensions and conditions of a dam, dike, or levee as it was built. Field conditions and material availability during construction often require changes from the original design drawings.

AXIS OF DAM - The plane or curved surface, arbitrarily chosen by a designer, appearing as a line, in plan or in cross section, to which the horizontal dimensions of the dam can be referred.

BASE WIDTH (BASE THICKNESS) - The maximum thickness or width of a dam measured horizontally between upstream and downstream faces and normal to the axis of the dam but excluding projections for outlets, etc.

BEACHING - The removal by wave action of a portion of the upstream (reservoir) side of the embankment and the resultant deposition of this material farther down the slope. Such deposition creates a relatively flat beach area.

BENCH - A horizontal step in the slope of an embankment.

BLANKET DRAIN - A drain that extends in a generally horizontal direction (much like a blanket) under a relatively large area of the downstream portion of the embankment, intercepts seepage through the embankment and the foundation, and prevents further saturation of the downstream toe.

BOIL - A disturbance in the surface layer of soil caused by water escaping under pressure from behind a water-retaining structure such as a dam or a levee. The boil may be accompanied by deposition of soil particles (usually sand) in the form of a cone ring around the area where the water escapes.

BREACH - An opening or a breakthrough of a dam sometimes caused by rapid erosion of a section of earth embankment by water.

CAMBER - A slight arch applied to the dam crest to account for embankment settlement.

CAVITATION - Wear on hydraulic structures where a high hydraulic gradient is present. Cavitation is caused by the abrupt change in direction and velocity of water reducing the pressure to vapor pressure and creating vapor pockets. These pockets collapse with great impact, producing very high impact pressures over small areas that eventually cause pits and holes in the surface. Noises and vibrations may be evident during high flows.

CONDUIT - A closed channel to convey the discharge through or under a dam.

CONCRETE DAM - Any dam constructed of concrete materials.

ARCH DAM - A concrete or masonry dam that is curved in plan so as to transmit the major part of the water load to the abutments.

BUTTRESS DAM - A dam consisting of watertight upstream face supported at intervals on the downstream side by a series of buttresses. Buttress dams can take many forms, eg. arch buttress dam, multiple arch dam, flat slab or Ambursen dam, solid head buttress dam.

GRAVITY DAM - A dam constructed of concrete and which relies upon its weight for stability. Concrete gravity dams can take several forms, e.g. arch gravity, curved gravity, and hollow gravity.

ROLLER COMPACTED CONCRETE DAM - A concrete dam constructed of a no-slump concrete that can be hauled in dump trucks, spread with a bulldozer or grader, and compacted with a vibratory roller.

CONSTRUCTION JOINT - The interface between two successive placing of pours of concrete where bonding, not permanent separation, is intended.

CONTRACTION JOINT - A joint constructed where shrinkage of the concrete would cause a crack.

CORE - The impervious or relatively impervious material forming the central part of a dam or embankment. Where a dam has a core, the outer zones are usually comprised of more pervious materials. Some dams are constructed entirely of a relatively homogeneous, impervious material with no distinct core. In this case, the entire dam is considered the core.

CORE WALL - A wall of substantial thickness built of impervious materials, usually of concrete or asphaltic concrete, in the body of an embankment to prevent leakage.

CORROSION - The chemical attack on a metal by its environment. Corrosion is a reaction in which metal is oxidized.

CREST LENGTH - The measured length of the top of the dam from abutment to abutment. This includes the length of spillway, powerhouse, navigation lock, fish passage, etc., where these structures from part of the length of the dam. If detached from the dam, these structures should not be included.

CREST OF DAM - The crown of an overflow section of the dam. In the United States, the term "crest of dam" is often used when "top of dam" is intended. To avoid confusion, the terms crest of spillway and top of dam should be used for referring to the overflow section and dam proper, respectively.

CRIB DAM - A gravity dam built up of boxes, cribs, crossed timbers, or gabions and filled with earth or rock.

CULVERT - (a) A drain or waterway structure built transversely under a road, railway, or embankment. A culvert usually comprises a pipe or a covered channel of box section. (b) A gallery or waterway constructed through any type of dam, which is normally dry but is used occasionally for discharging water; hence the terms scour culvert, drawoff culvert, and spillway culvert.

CURTAIN

DRAINAGE CURTAIN - See Drainage Well.

GROUT CURTAIN (GROUT CUTOFF) - A barrier produced by injecting grout into a vertical zone, usually narrow in horizontal width, in the foundation to reduce seepage under a dam. (See Grout)

CUTOFF - An impervious barrier used to reduce or prevent seepage from passing through the foundation under the dam.

CUTOFF TRENCH - The excavation later to be filled with impervious material so as to form the cutoff. Sometimes used incorrectly to describe the cutoff itself.

CUTOFF WALL - A wall of impervious material (e.g., concrete, asphaltic concrete, steel sheet piling) built into the foundation to reduce seepage under the dam.

DAM - Any manmade barrier, together with its abutments and appurtenant works, if any, constructed for the purpose of storing or directing water or for receiving dredge disposal material, as determined by the Administration.

DANGER REACH - That area downstream from a dam within which a sudden release of waters resulting from failure of the dam would cause an artificial flood.

DIKE - See Levee.

DISTRESS - A condition of severe stress, strain, or deterioration indicating possible or potential failure.

DIVERSION CHANNEL, CANAL, OR TUNNEL - A waterway used to divert water from its natural course. The term is generally applied to a temporary arrangement, e.g., to convey water around a dam site during construction. Channel is normally used instead of canal when the waterway is short. Occasionally the term is applied to a permanent arrangement (diversion canal, diversion tunnel, diversion aqueducts).

DRAIN GATE - See Emergency Gate.

DRAINAGE AREA - The area that drains naturally to a particular point on a river or stream.

DRAINAGE LAYER OR BLANKET - A layer of pervious material in a dam to relieve pore pressures or to facilitate drainage of the fill.

DRAINAGE WELL OR RELIEF WELL - Vertical wells or boreholes downstream of, or in the downstream berm of, an embankment to collect and control seepage through or under the dam and so reduce water pressure. A line of such wells forms a drainage curtain.

DRAWDOWN - The resultant lowering of water surface level due to release of water from the reservoir.

EMBANKMENT - Fill material, usually earth or rock, placed with sloping sides and usually with a length greater than its height. An "embankment" is a part of a dam.

EMBANKMENT-ABUTMENT CONTACT - That area at the intersection of either the upstream or downstream slope of an embankment and the valley wall or abutment.

EMBANKMENT DAM - Any dam constructed of excavated natural materials.

EARTH DAM (EARTHFILL DAM) - An embankment dam in which more than 50 percent of the total volume is formed of compacted fine-grained material obtained from a borrow area.

HOMOGENEOUS EARTHFILL DAM - An embankment dam constructed of similar earth material throughout, except for possible inclusion of internal drains or drainage blankets. This term is use to differentiate from a zoned earthfill dam.

HYDRAULIC FILL DAM - An embankment dam constructed of materials, often dredged, that are conveyed and placed by suspension in flowing water.

ROCKFILL DAM - An embankment dam in which more than 50 percent of the total volume comprises compacted or dumped pervious natural or crushed rock.

ROLLED FILL DAM - An embankment dam of earth or rock in which the material is placed in layers and compacted by using rollers or rolling equipment.

ZONED EMBANKMENT DAM - An embankment dam, the thickness of which is composed of zones of selected earth and rock materials having different degrees of porosity, permeability, and density.

EMERGENCY GATE - A standby or reserve gate used only when the normal means of water control is not available; also referred to as a drain gate.

FILTER DIAPHRAGM - A zone of granular material that is constructed around a conduit that passes through an embankment dam or foundation that will allow seepage flow without migration of soil particles. See SCS publication TR-60 "Earth Dams and Reservoirs".

FLASHBOARDS - Lengths of timber, concrete, or steel placed on the crest of a spillway to raise the retention water level but that may be quickly removed in the event of a flood either by a tripping device or by deliberately designed failure of the flashboards or their supports.

FLOODPLAIN - An area adjoining a body of water or natural stream that has been or may be covered by flood water. The floodplain is based on the 100 year frequency flood and is included as waters of the State (Annotated Code of Maryland, Natural Resources Article, §8-101(k)).

FLOOD ROUTING - The determination of the attenuating effect of storage on a flood passing through a valley, channel, or reservoir.

FOUNDATION OF DAM - The undisturbed material on which the dam structure is placed.

FREEBOARD - The vertical distance to the crest of a dam above the water surface at the time of maximum design flow over the spillway.

FUSE PLUG SPILLWAY - A form of auxiliary or emergency spillway comprising a low embankment or a natural saddle designed to be overtopped and eroded away during a very rare and exceptionally large flood.

GABION - A hollow cage or basket, usually of heavy wire, filled with stones or rock and used as a revetment or other protective device to sustain a wall or channel.

GROUT - A thin cement mortar used to fill voids, fractures, or joints in masonry, rock, sand and gravel, and other materials. As a verb it refers to filling voids with grout. Grout is usually applied under pressure.

HEIGHT OF DAM - The vertical measurement expressed in feet as measured from the downstream toe of the dam at its lowest point to the elevation of the top of the dam.

INFLOW DESIGN FLOOD - The largest flood that a given project is designed to pass safely. The reservoir inflow discharge hydrograph used to estimate the spillway discharge capacity requirements and corresponding maximum surcharge elevation in the reservoir.

LEFT ABUTMENT - The abutment on the left-hand side of an observer when looking downstream.

LEVEE - A long embankment structure. Usually built along a watercourse to protect land from flooding. If built of concrete or masonry, a levee is usually referred to as a flood wall. Also used to describe embankments that block areas on the reservoir rim that are lower than the top of the main dam and that are quite long.

MASONRY DAM - Any dam constructed mainly of stone, brick, or concrete blocks that may or may not be joined with mortar. A dam having only a masonry veneer facing should not be referred to as a masonry dam.

MAXIMUM CROSS SECTION OF DAM - Cross section of a dam at the point where the height of the dam is the maximum.

MAXIMUM POOL LEVEL - The maximum water level, including the flood surcharge the dam is designed to withstand.

NORMAL DEPTH - The maximum vertical distance from the stream bed invert at the upstream toe of the dam to the normal water surface.

OBSERVATION WELL - Small diameter perforated vertical tube installed within an embankment. Used to measure the height of the internal water surface (phreatic surface) in the embankment at the location of the well.

ONE-HUNDRED YEAR (100-YEAR) FLOOD - The flood magnitude having an exceedence frequency of one percent in any given year. It is often expressed as expected to be equalled or exceeded on the average of one in 100 years.

OUTLET - An opening through which water can be freely discharged from the reservoir to the stream.

OWNER - Any person or persons and their duly authorized agents, owning, operating, maintaining, or proposing to construct a dam, reservoir, or other obstruction, or to change the course, current, or cross section of any body of water in the State.

PERMEABILITY - A material property which defines the capacity to transmit water.

PERVIOUS ZONE - A part of the cross section of an embankment dam comprising material of high permeability.

PHREATIC SURFACE (SEEPAGE SURFACE) - The upper surface of seepage in an embankment. All the soil below the surface will be saturated when the equilibrium condition has been reached.

PIPE CONDUIT - Any tube or hollow channel that conveys water to or from a reservoir.

PIPING - Progressive erosion and removal of soil by concentrated seepage flows through a dam, dike, or levee, its foundation, or its abutment. As material is eroded, the area of the "pipe" increases and the quantity and velocity of flow increase, which in turn erodes more material. The process continues at a progressively faster rate until controlled, or failure occurs.

PLUNGE POOL - An excavated pool at the outlet structure that is designed to withstand erosion from high velocities. The plunge pool is armored with riprap.

PORE PRESSURE - The internal cellular pressure of a fluid (air and water) within the voids of a mass of soil, rock, or concrete.

PROBABLE MAXIMUM PRECIPITATION (PMP) - Theoretically the maximum depth of precipitation for a given duration that is physically possible over a given size storm area at a particular geographic location at a certain time of the year.

PROBABLE MAXIMUM FLOOD (PMF) - The most severe flood considered possible in a specific region. This may be:

a) The Probable Maximum Flood as determined by a source acceptable to the Administration; or

b) Calculated using a rational consideration of the chances of simultaneous occurrence of the maximum of several elements or conditions which contribute to the flood.

RANDOM FILL - Earth or rockfill, the grading of which is not specified and that is placed without treatment just as it comes from the excavation.

RESERVOIR - Any basin, either natural or artificial, used for collecting or storing of water. Reservoir capacity is the total volume in reservoir between lowest point in the reservoir and horizontal plane at crest of overflow spillway.

REGULATIONS - Title 26, Subtitle 17, Chapter 05, Regulations .01 thru .13 of the Code of Maryland Regulation (COMAR); also known as Construction on Non-Tidal Waters and Floodplains.

RIGHT ABUTMENT - The abutment on the right-hand side of an observer when looking downstream.

RIPRAP - A layer of large uncoursed stones, broken rock, or precast blocks placed in random fashion on the upstream slope of an embankment dam, on a reservoir shore or in a channel as a protection against flows, wave and ice action.

SCARP - The nearly vertical, exposed earth surface created at the upper edge of a slide or a beached area along the upstream slope.

SEEPAGE - The slow percolation (or oozing) of a fluid through a permeable material in and under the structure, the depth of water behind the structure, and the length of the path the water must travel through or under the structure.

SETTLEMENT (CONSOLIDATION) - The gradual process of soil compression due to the squeezing out of water, causing a building or embankment to settle.

SHELL - The upstream and downstream parts of the cross section of a zoned embankment dam on each side of the core or core wall.

SLIDE - The movement of a mass of earth and rock down a slope. In embankments and abutments, this involves the separation of a portion of the slope from the surrounding material.

SLOPE PROTECTION - The protection of the embankment slope against wave action and erosion.

SLOUGH - The separation from the surrounding material and downhill movement of a small portion of the slope. Usually a slough refers to a shallow earth slide.

SLUICE GATE - A gate used to control the flow of water through a sluice, or artificial discharge channel. Most sluice gates are used with square openings and are connected to a handwheel lift mechanism by a vertical stem.

SPALLING - Breaking (or erosion) of small fragments from the surface of concrete masonry or stone under the action of weather or abrasive forces.

SPILLWAY - A structure over or through which water is discharged. If the flow is controlled by gates, it is considered a controlled spillway; if the elevation of the spillway crest is the only control, it is considered an uncontrolled spillway.

EMERGENCY SPILLWAY (AUXILIARY SPILLWAY) - A secondary spillway designed to operate only during exceptionally large floods.

OGEE SPILLWAY (OGEE SECTION) - An overflow weir in which in cross section the crest, downstream slope, and bucket have an S or ogee form of curve. The shape is intended to match the underside of the nappe at its upper extremities.

OVERFLOW SPILLWAY - Any operating, emergency, or other spillway which discharges with a free water surface over or around the dam as opposed to a gate, or conduit which discharges through or beneath the dam or nearby ground.

PRINCIPAL SPILLWAY - The principal or first-used spillway that conveys all normal stream flows through the reservoir. The principal spillway generally carries all flows up to the emergency spillway.

RISER SPILLWAY - A principle spillway that consists of a circular or square standpipe that carries normal stream flows through the reservoir. This type of spillway is connected to a conduit that passes through the dam.

SERVICE SPILLWAY - A principal spillway used to regulate reservoir releases additional to or in lieu of the outlet.

SHAFT SPILLWAY (MORNING GLORY SPILLWAY) - A vertical or inclined shaft into which flood water spills and then is conducted through, under, or around a dam by means of a conduit or tunnel. If the upper part of the shaft is splayed out and terminates in a circular horizontal weir, it is termed a bellmouth or morning glory spillway.

SIDE CHANNEL SPILLWAY - A spillway, the crest of which is roughly parallel to the channel immediately downstream of the spillway.

SIPHON SPILLWAY - A spillway with one or more siphons built at crest level. This type of spillway is sometimes used for providing automatic surface-level regulation within narrow limits or when considerable discharge capacity is necessary within a short period of time.

SPILLWAY CHANNEL - A channel conveying water from the spillway crest to the river downstream.

STAFF GAUGE - A device marked in feet used to indicate and measure water levels.

STILLING BASIN - An energy-dissipating device located at the outlet of a spillway to dissipate the high velocity (energy) of the flowing water in order to protect the spillway structure and avoid serious erosion of the outlet channel and subsequent undermining. Stilling basins are generally constructed of concrete.

STORAGE - The retention of water or delay of runoff either by planned operation as in a reservoir, or by temporary filing of overflow areas, as in the progression of a flood crest through a natural stream channel.

SURVEY MONUMENT - A point established on or in the vicinity of an embankment. Provides a set point to survey and, over time, will indicate whether any movement has taken place.

TAILWATER LEVEL - The level of water in the discharge channel immediately downstream of the dam.

TOE OF DAM - The junction of the downstream face of a dam with the ground surface. Also referred to as downstream toe. For an embankment dam, the junction of the upstream face with ground surface is called the upstream toe.

TOE DRAIN - Drains commonly installed along the downstream toe of the dam to collect seepage discharging from the embankment and foundation and lead it to an outfall pipe which discharges away from the dam.

TRANSITION ZONE (SEMI-IMPERVIOUS ZONE) - A part of the cross section of a zoned embankment dam comprising material whose grading is of intermediate size between that of an impervious zone and that of a permeable zone.

TRASH RACK - A structure of metal or reinforced concrete bars located at the intake of a waterway to prevent entrance of floating or submerged debris of a certain size and larger.

TRENCH DRAIN - A drain commonly installed in or along an embankment, abutment, or the foundation of a dam in order to relieve uplift pressures and carry seepage away from dam. Toe drains are generally installed in the bottom of the trench.

UPLIFT - The upward pressure on the base of a structure.

WATERS OF THE STATE - Includes both surface and underground waters within the boundaries of the State of Maryland subject to its jurisdiction, including that portion of the Atlantic Ocean within the boundaries of the State, the Chesapeake Bay and its tributaries, and all ponds, lakes, river, streams, public ditches, tax ditches, and public drainage systems within the State, other than those designed and used to collect, convey, or dispose of sanitary sewage. The floodplain of free-flowing waters determined by the Department on the basis of the 100-year flood frequency is included as waters of the State.

WEIR - A type of spillway in which flow is constricted and caused to fall over a crest. Sometimes specially designed weirs are used to measure flow amounts. Types of weirs are used to measure flow amounts. Types of weirs include "broad-crested" "ogee" and "v-notch."

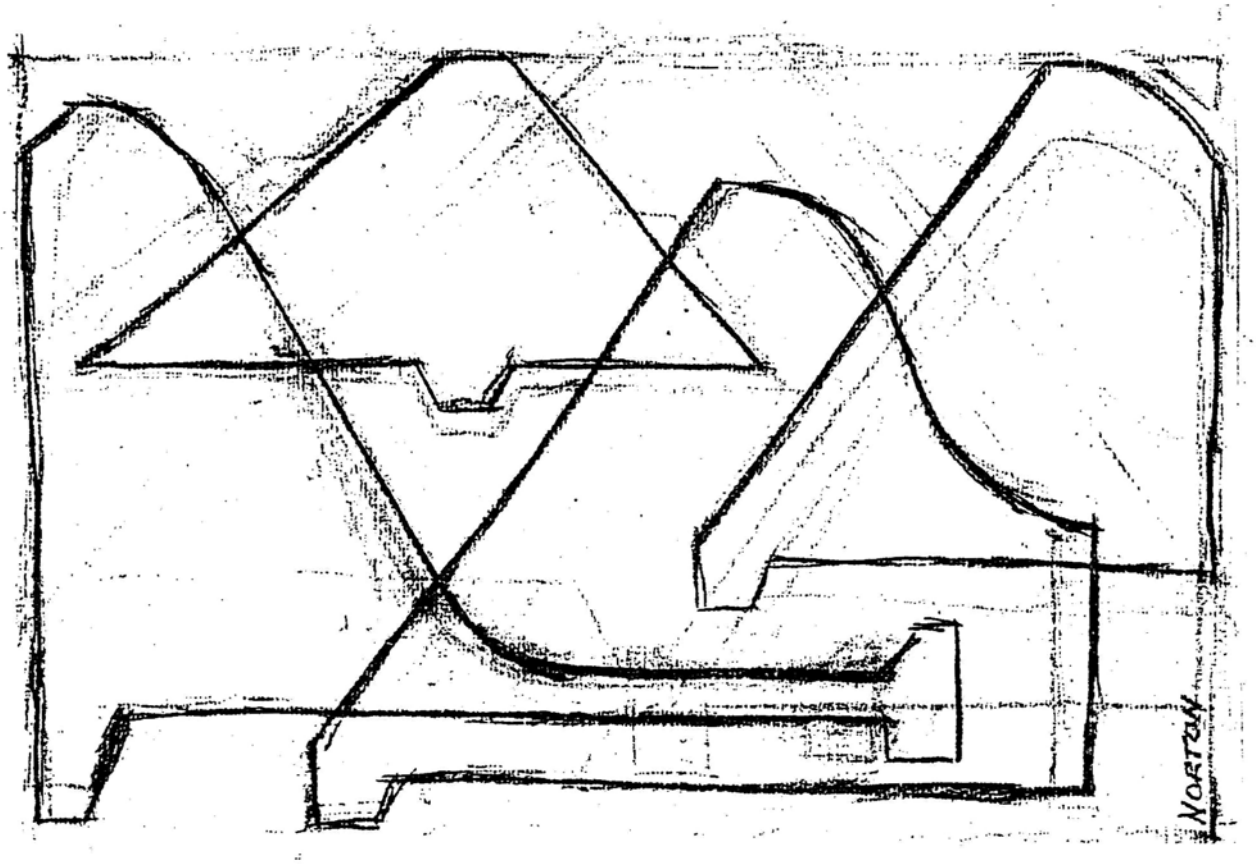
JOHNSTOWN FLOOD

A jam at stone bridge caused a 10- to 30-foot lake over Johnstown.

The fire there, probably caused by oil and hot coals, burned for 2 days.

As soon as the water receded, rescue workers began searching for survivors and bodies. Some waited days to be rescued.

Survivors lived in army tents and leantos. Prefabricated "Oklahoma" houses, furnished with essentials, were later sold for $250.



Shattered buildings were thrown into piles three stories high, completely filling some blocks.

The flood snapped large trees like sticks and turned them into battering rams that could pierce walls.

Cambria Iron Company's prompt reassurance that mills would be rebuilt heartened the many Johnstown citizens who depended on them.

302 CMR 10.00: DAM SAFETY

Section

10.01: Authority and Purpose
10.02: Application
10.03: Definitions
10.04: Exclusions
10.05: Registration
10.06: Size and Hazard Classification
10.07: Inspection Schedule
10.08: Compliance with Inspection Results
10.09: Dam Construction, Repair, Alteration, Breach or Removal Permit
10.10: Revocation, Suspension, or Modifications of Chapter 253 Permits
10.11: Emergency Action Plans
10.12: Records
10.13: Liability
10.14: Design and Construction Criteria for New and Existing Dams
10.15: Schedule of Fees and Fines
10.16: Severability

10.01: Authority and Purpose

(1) 302 CMR 10.00 is promulgated pursuant to the authority granted the Department of Environmental Management (DEM) in M.G.L. c. 253, § 44.

(2) The purpose of 302 CMR 10.00 is to provide regulatory guidelines for the safety of dams by establishing reasonable standards and to create a public record for reviewing the performance of a dam.

10.02: Application

302 CMR 10.00 *et seq*. shall apply to the registration of dams, safety inspections, owner responsibilities, applications for review and approval of plans for the construction, alteration, modification, repair, enlargement, and removal of dams, quality assurance of construction, acceptance of construction, notification of intent to construct, and emergency action plans. 302 CMR 10.00 shall apply to any dam, as defined herein, constructed, altered or used to store and/or divert water in Massachusetts. Certain structures herein defined are exempt from 302 CMR 10.00.

10.03: Definitions

In addition to M.G.L. c. 253, § 44 as used in 302 CMR 10.00, the following terms shall have the following meanings:

(1) Undefined Terms. As used in 302 CMR 10.00 any term not defined in accordance with 302 CMR 10.03 shall have the meaning given to the term by any statutes, regulations, executive orders or policy directives governing the subject matter of the term. Examples include terms pertaining to:

(a) wetlands, which is defined by the Wetlands Protection Act, M.G.L. c. 131, § 40, and its implementing regulations, 310 CMR 10.00, and 33 USC 1341 and 314 CMR 9.00 regarding Water Quality Certification, as well as other statutes, regulations, executive orders, or policy directives that govern wetlands issues; and

(b) roadways or traffic, which is defined by the Massachusetts Highway Department's Highway Access Policy (adopted September 17, 1991), its Standard Operating Procedure for Review of State Highway Access permits (adopted September 17, 1991), and the Guidelines for EIR/EIS Traffic Impact Assessment (1989, as amended) by the Executive Office of Transportation and Construction and the Executive Office of Environmental Affairs, as well as other statutes, regulations, executive orders or policy directives that govern roadway and traffic issues.

10.03: continued

(2) Defined Terms. As used in 302 CMR 10.00, the following terms shall have the following meanings:

Abutment means that part of a valley side against which a dam is constructed. An artificial abutment is sometimes constructed as a concrete gravity section, to take the thrust of an arch dam where there is no suitable natural abutment. Right and left abutments are those on respective sides of an observer looking downstream.

Acre-foot means a unit of volumetric measure that would cover one acre to a depth of one foot. It is equal to 43,560 cubic feet. One million U.S. gallons = 3.068 acre foot.

Applicant means any person making application for a dam safety permit.

Appurtenant Works means structures, either in dams or separate therefrom, including, but not limited to, spillways; reservoirs and their rims; low level outlet works; and water conduits, including tunnels, pipelines or penstocks, either through the dams or their abutments.

Artificial Impoundment means as applied to dam safety, a reservoir created by a dam.

As- builts means plans, drawings and all other descriptive and factual information that depict how a dam was actually constructed or repaired. As-builts are required to be submitted to the Commissioner at dam completion.

Authority means M.G.L. c. 253, §§ 44 through 48.

Axis of Dam means a plane or curved surface, arbitrarily chosen by a designer, appearing as a line in a plan or cross section to which the horizontal dimensions of the dam can be referred.

Baffle Block means a block, usually of concrete, constructed in a channel or stilling basin to dissipate the energy of water flowing at high velocity.

Base Width (Base Thickness) means the maximum width or thickness of a dam measured horizontally between upstream and downstream faces and normal to the axis of the dam but excluding projections for outlets, etc.

Beaver Dams means dams that are constructed by beavers and that are not subject to 302 CMR 10.00. Control of beaver population and removal of beaver dams is regulated by M.G.L. c. 131, 321 CMR 2.00: *Miscellaneous Regulations Relating to Fisheries and Wildlife*, and also by the Local Boards of Health and Conservation Commissions.

Berm means a horizontal step or bench in the sloping profile of an embankment dam.

Boil means a disturbance in the surface layer of soil caused by water escaping under pressure from behind a water retaining structure such as dam or a dike. The boil may be accompanied by deposition of soil particles (usually sand) in the form of a ring (miniature volcano) around the area where the water escapes.

Certificate of Completion means a document signed and stamped by a registered professional engineer with contractor's signature and supporting as-builts, upon completion of the work, attesting that the work has been performed in accordance with the permit conditions.

Certificate of Compliance means when a dam has been deemed safe, evaluated, constructed, repaired, altered or removed to the satisfaction of the Commissioner under a properly issued permit, the Commissioner shall issue a certificate of compliance, on a form prescribed by the Commissioner, to the owner approving the dam but subject to terms and conditions, if any. Such certificate shall be recorded by the owner in the registry of deeds in the county where the dam lies.

10.03: continued

Certificate of Non-compliance means a certificate of non-compliance issued by the Commissioner determines that the dam or appurtenant features are unsafe. Such certificate shall be recorded by the Commissioner in the registry of deeds in the county where the dam lies.

Certificate of Registration means a form to be provided by the Commissioner to be completed by the owner and filed with the Department.

Cofferdam means a temporary structure enclosing all or part of a construction area so that construction can proceed in a dry area. A "diversion cofferdam" diverts a river into a pipe, channel or tunnel.

Commissioner means the Commissioner of the Department of Conservation and Recreation or his authorized designee.

Conduit means a closed channel for conveying discharge through or under a dam.

Crib Dam means a gravity dam built up of boxes, cribs crossed timbers, or gabions and filled with earth or rock.

Culvert means a drain or waterway built transversely under a road, railway, or embankment, usually consisting of a pipe or covered channel of box section. A gallery or waterway constructed through any type of dam, which is normally dry but is used occasionally for discharging water, hence the terms "scour culvert", "drawoff culvert", and "spillway culvert". A roadway or railway culvert shall not be considered a dam if its invert is at the natural bed of the water course, it has adequate discharge capacity, and it does not impound water under normal circumstances. A culvert with installed man made water control device which impounds, release or diverts water may be designated by the Commissioner as a dam.

Cutoff Wall means an impervious construction or material which reduces seepage or prevents it from passing through foundation material.

Dam means any artificial barrier, including appurtenant works, which impounds or diverts water, and which:

(a) is 25 feet or more in height from the natural bed of the stream or watercourse measured at the downstream toe of the barrier, or from the lowest elevation of the outside limit of the barrier, if it is not across a stream channel or watercourse, to the maximum water storage elevation; or

(b) has an impounding capacity at maximum water storage elevation of 50 acre feet or more. Any other artificial barrier, including appurtenant works, the breaching of which could endanger property or safety, may be designated by the Commissioner as a dam, and shall be subject to M.G.L. c. 253, §§ 44 through 48.

The word "dam" shall not mean any of the following:

(c) any appurtenant works which temporarily impounds or diverts water used on land in agricultural use as defined pursuant to M.G.L. c. 131, § 40;

(d) any barrier or appurtenant works which has a size classification of small or low hazard potential classification that is used on land in agricultural use as defined in M.G.L. c. 131, § 40; and

(e) any barrier which is not in excess of six feet in height, regardless of storage capacity, or which has a storage capacity at maximum water storage elevation not in excess of 15 acre feet, regardless of height. The Commissioner shall make such determination by taking into consideration factors such as height, type of structure, condition of structure, volume of the impoundment, extent of development downstream, and other factors deemed appropriate by the Commissioner.

Dam Breach means an eroded opening through a dam which drains the impoundment. A controlled breach is a design and constructed opening. An uncontrolled breach is an unintentional opening which allows uncontrolled discharge from the impoundment,

Dam Break Analysis means a determination of a flood hydrograph resulting from a dam breach.

10.03: continued

Dam Certificate of Registration means a certificate to be issued by the Commissioner to the dam owner.

Dam Failure means an uncontrolled release of impounded water from a dam.

Dam Inspection Form or Format means a form or forms prescribed by the Commissioner containing information relative to the present condition, safety and adequacy of the dam and such other information as the Commissioner may require by regulation, signed by a registered professional engineer and filed with the Department.

Dams Not Regulated by M.G.L. c. 253, §§ 44 through 48 means dams constructed by beavers, created by ice, debris etc. and any other non man-made structures.

Dam Registration Form means a form or forms to be provided by the Commissioner to be prepared by the owner and filed with Commissioner containing the name of the owner, the location and the dimensions of the dam and such other information as the Commissioner may require by regulation.

Dam Safety Engineer means a person who is employed by the department who meets the requirements established by the Department of Personnel Administration

Database means electronic database of detailed information about dams. The database is owned, compiled, maintained and distributed by the Commissioner. Requests for database information are subject to M.G.L. c. 4, § 7, clause twenty-sixth (n) (Public Records) until suspended.

DEP means the Department of Environmental Protection

Department means the Department of Conservation and Recreation (DCR), as established in M.G.L. c. 21 § 1.

Drainage Area means the area which drains to a particular point on a river or stream.

Drawdown means the lowering of water surface level due to loss of water from a reservoir.

Embankment means the fill material, usually earth or rock, placed with sloping sides which provide a permanent barrier which impounds water.

Emergency Condition means unsafe dams with highest risk of failure, requiring immediate attention and a predetermined plan of action to reduce the highest level of risk, for the protection of public safety.

Emergency Action Plan means a predetermined plan of action to be taken to reduce the potential for property damage and/or loss of life in an area affected by an impending dam break.

Engineer/Design Engineer, *See* Registered Professional Engineer.

Factor of Safety means as applied to dam safety, the ratio of the forces or moments resisting mass movement to the forces or moments tending to produce mass movement.

Fees means as applied to dam safety, the cost of services listed under 302 CMR 10.15 and provided by the Department

Flashboards means a length of timber, concrete, or steel placed on the crest of a spillway to raise the retention water level but that may be quickly removed in the event of a flood either by a tripping device or by a deliberately designed failure of the flashboard or its supports.

Flow Net means graphical representation of families of streamlines and equipotential lines, used in groundwater studies to determine quantities, rate, and directions of flow.

10.03: continued

Freeboard means the vertical distance between a stated water level and the top of a dam. Net Freeboard, Dry freeboard, Flood Freeboard or Residual Freeboard is the vertical distance between the estimated maximum water level and the top of a dam.

Gravity Dam means a dam constructed of concrete and/or masonry that relies on its weight for stability.

Great Pond means a pond containing in its natural state more than ten acres of land, as defined in the Waterways regulations at 310 CMR 9.02.

Great Pond/Enlarged means as applied to dam safety, any change in or addition to an existing Great Pond which raises or may raise the water storage elevation, of the water impounded by a Great Pond, by construction of a dam.

Hazard Potential Classification means the rating for a dam based on the potential consequences of failure. The rating is based on potential for loss of life and damage to property that failure of that dam could cause downstream of the dam. The hazard potential classification for a dam also is based on the incremental adverse consequences of failure, and has no relationship to the current structural integrity, operational status, flood routing capability, or safety condition of the dam or its appurtenances.

Height of Dam means the vertical distance from the lowest elevation of the dam crest to the lowest point of natural ground, including any stream channel, along the downstream toe of the dam.

Hydraulic and Hydrologic (H&H) Analyses means the analytical process of computing the change in a flood wave as it passes through a reservoir or a channel.

Hydraulic Height means the height to which water rises behind a dam and the difference between the lowest point in the original streambed at the axis of the dam and the maximum controllable water surface.

Hydrograph/Flood means a graphical representation of the flood discharge with respect to time for a particular point on a stream or river.

Inspections

(a) Additional Required Inspection means an additional inspection by a registered professional engineer of the dam, in accordance with the inspection frequency established by the Commissioner, to detect apparent signs and changes of deterioration in material, developing weaknesses or unsafe hydraulic and/or structural behavior or any other deficiencies of the dam structure or function since the initial Phase I or poor/unsatisfactory condition was determined. The additional inspection report shall follow a form as established by the Commissioner.

(b) Follow-up Inspection means an inspection when it is desirable to obtain supplemental data and/or to observe or monitor a dam under particular conditions (i.e. wet season, dry season, foliage, etc.)

(c) Phase I Formal Inspection means the visual inspection of the dam, in accordance with the inspection frequency established by the Commissioner, by a registered professional civil engineer to evaluate or reevaluate the safety and integrity of the dam and appurtenant structures to determine if the structure meets current design criteria. Formal inspection includes field observations to detect any signs of deterioration in material, developing weaknesses or unsafe hydraulic and/or structural behavior and a review of the records on project design, construction and performance. The final formal inspection report shall follow a form or format as established by the Commissioner and shall be filed with the Office of Dam Safety. All formal field inspections shall be performed during good weather conditions.

10.03: continued

(d) Phase II Detailed Inspection means all studies, investigations and analyses appropriate to evaluate the structural safety and hydraulic capacity of a dam or reservoir and appurtenant works. This inspection may include, but is not limited to, structural stability analyses, detailed hydrologic/hydraulic assessment, dam breach analyses, subsurface investigation, soil and materials testing, foundation explorations, conclusions, conceptual alternatives, cost estimate and recommendations. This inspection shall be performed by a registered professional civil engineer.

(e) VIF (Verification In Field) Inspection means an inspection for jurisdictional determination, and/or to obtain supplemental data, and/or for any other reason(s) deemed appropriate by the Commissioner.

(f) Visual Inspection means a visual but technical evaluation that must be performed of the physical conditions which affect performance of the structure and may include an analysis of the dam's ability to pass flood waters and must be performed by a registered professional civil engineer or dam safety engineer.

Instrumentation means an arrangement of devices installed into or near dams (*i.e*. piezometers, inclinometers, strain gages, measurement points, *etc*.) which provide for measurements that can be used to evaluate the structural behavior and performance parameters of the structure.

Inundation Map means a map delineating the area that would be flooded by a particular flood event or dam failure.

Liability means legal liability associated with the ownership, operation, maintenance, repair and failure of a dam.

Lien means a notice for the payment by the owner to the Commonwealth of the costs and expenses incurred by the Commonwealth for any actions taken in accordance with M.G.L. c. 253, § 47 and shall be effective upon mailing to the owner at the address shown in the Certificate of Registration and recorded at the Registry of Deeds in the county where the dam lies.

Low Level Outlet (Bottom Outlet) means an opening at a low level in a reservoir generally used for emptying the reservoir or scouring sediment and sometimes for irrigation.

Materially Alter means any change to a dam or reservoir which affects the physical parameters and/or safety of the dam or reservoir which may include, but is not limited to changing the height of a dam, increasing the normal pool or spillway elevation or changing the elevation or physical dimensions of an emergency spillway.

Maximum Impoundment Elevation means the maximum elevation of water surface which can be contained by the dam without overtopping the embankment section.

Maximum Water Storage Elevation means the reservoir elevation level reached during the spillway design flood.

Normal Water Level means for a reservoir with a fixed overflow sill the lowest crest level of that sill. For a reservoir whose outflow is controlled wholly or partially by movable gates, siphon or other means, it is the maximum level to which water may rise under normal operating conditions, exclusive of any provision for flood surcharge.

One-hundred-year Storm Event means the storm which is estimated to have a 1% chance, or one chance in 100 of being equaled or exceeded in one year, or one chance in 100 hundred years of being equaled.

Operation and Maintenance Manual (O&MM) means a document identifying routine maintenance and operational procedures under routine and storm conditions.

Order means a written document prepared and issued by the Commissioner which mandates specific actions to be accomplished by a dam owner within a specified time frame. Failure to comply with an order shall make the owner subject to fines as provided for in 302 CMR 10.15.

10.03: continued

Orientation:

(a) Upstream means the side of the dam that borders the reservoir.
(b) Downstream means the high side of the dam, the side opposite the upstream side.
(c) Right means the area to the right when the viewer is looking downstream.
(d) Left means the area to the left when the viewer is looking downstream.

Owner means the person or persons, including any individual, firm, partnership, association, syndicate, company, trust corporation, municipality, agency, political or administrative subdivision of the commonwealth or any other legal entity of any kind holding legal title to a dam, but excluding the United States, its agencies or any person who operates a dam owned by the United States.

Permit or Chapter 253 Dam Safety Permit means a written approval, pursuant to M.G.L. c. 253, §§ 44 through 48, to construct, repair, alter, breach or remove a dam. The technical aspect of the Permit must be reviewed and approved by a Dam Safety Engineer.

Phreatic Surface means the free surface of groundwater at atmospheric pressure.

Piezometer means as applied to dam safety, an instrument used for measuring water pressure within soil, rock or concrete.

Piping means the progressive development of internal erosion by seepage, appearing downstream as a hole or seam discharging water that contains soil particles..

Poor Condition means dams with major structural, operational, maintenance and flood routing capability deficiencies. Also unsafe-nonemergency dams.

Probable Maximum Flood (PMF) means the most severe flood that is considered reasonably possible at a site as a result of the most severe combination of critical meteorological and hydrologic conditions possible in the region.

Registered Professional Engineer means a civil engineer licensed and registered in the Commonwealth of Massachusetts with experience in dam safety inspections and engineering. Individuals licensed and registered in another state, but not in Massachusetts must be approved by the Commissioner.

Removal means the destruction or breaching of a dam to the extent that no water can be impounded by the dam.

Repairs means any work done at a dam which affects the integrity of the dam. This includes but is not limited to, work requiring excavation into the embankment fill or foundation of a dam or work requiring removal or replacement of major structural components of a dam.

Reservoir means the area which contains or will contain the body of water impounded by a dam.

Riprap means is a layer of large uncoursed stones, broken rock, or pre-cast blocks placed in random fashion on the upstream slope of an embankment dam, on a reservoir shore, or on the sides of a channel as a protection against wave and ice action. Very large rip-rap is sometimes referred to as armoring.

Risk means a measure of the likelihood and severity of adverse consequences. In dam safety applications, life-safety risk is expressed in units of loss-of-lives per year; economic, societal and environmental risks are expressed in units of dollars per year. The risk may be associated with an individual failure mode or it may be total risk, representing the cumulative risk associated with all failure modes

Risk Assessment means as applied to dam safety, the process of identifying the likelihood and consequences of dam failure to provide the basis for informed decisions on a course of action.

10.03: continued

Roll Dams means low head dams usually run of the river overflow weir or spill way structures that produce vertical water surface drops of one to 15 feet and change river flows from super-critical to sub-critical.

Run-of-the-river-dam means a dam situated on a river or stream whose spillway length and width of impoundment is nearly equal to the width of the original river or stream bank to bank.

Safety Evaluation means as applied to dam safety, the process of determining the ability of a dam and its appurtenances to pass a given flood.

Seepage means the interstitial movement of water that may take place through a dam, its foundation, or its abutments.

Siphon/Inverted means a conduit or culvert to permit water to pass under an intersecting roadway, stream or other obstruction.

Spillway means a structure over or through which flood flows are discharged. If the flow is controlled by gates, it is a controlled spillway; if the elevation of the spillway crest is the only control, it is an uncontrolled spillway.

Spillway/Auxiliary (Emergency Spillway) means a secondary spillway designed to operate only during exceptionally large floods.

Spillway(s) Design Flood (SDF) means the flood used in the design of a dam and its appurtenant works particularly for sizing the spillway(s) and outlet works, and for determining maximum temporary storage and height of dam requirements.

Stoplogs means large logs or timbers or steel beams placed on top of each other with their ends held in guides on each side of a channel or conduit to control water level in reservoir.

Tailwater Level means as applied to dam safety, the level of water in the discharge channel immediately downstream of the dam.

Toe of Dam means the junction of the downstream face of a dam with the ground surface, also referred to as downstream toe. For an embankment dam, the junction of the upstream face with ground surface is called the upstream toe.

Unsafe Dam means a dam whose condition, as determined by the Commissioner, is such that a high risk of failure exists. Among the deficiencies which would result in this determination are: excessive seepage or piping, significant erosion problems, inadequate spillway capacity and/or condition of outlet(s), and serious structural deficiencies, including movement of the structure or major cracking.

Uplift means as applied to dam safety, the upward pressure in the pores of a material(interstitial pressure) or on the base of a structure.

Water Storage Elevation means the maximum elevation without encroaching on the approved freeboard at maximum design flood.

Weir means a low dam or wall built across a stream to raise the upstream water level. Termed fixed-crest weir when uncontrolled. A structure built across a stream or channel for the purpose of measuring flow. Types of weir include broadcrested weir, sharp-crested weir, ogee weir, and V-notched weir.

10.04: Exclusions

Dams owned and operated by the United States, its agencies or any person who operates a dam owned by the United States are excluded from the provisions in 302 CMR 10.00, together with dams and reservoirs licensed and subject to inspection by the Federal Energy Regulatory Commission (FERC) provided that a copy of all FERC approved periodic inspection reports are provided to the Department. All other dams are subject to 302 CMR10.00 unless exempted in writing by the Commissioner, M.G.L. c. 253, §§ 44 through 48, or 302 CMR 10.00. Examples of exempt dams could be temporary drainage detention ponds, surface impoundments (other than water) for industrial or commercial wastes which are regulated by other agencies or storage tanks.

10.05: Registration

(1) General. The purpose of registration is to establish a public record of the dam.

(2) The owner of any dam subject to 302 CMR 10.00 shall cause to be filed with the Commissioner, within 30 days following notice by him, on a form prescribed by him, a Dam Registration Form containing the name of the owner, the location and dimensions of such dam and such other information as the Commissioner may reasonably require.

(3) A registration form shall not be deemed received by the Commissioner until all information required by statute or 302 CMR 10.00 is furnished.

(4) In the event that the owner fails to file the dam registration form in the time prescribed, the Commissioner may notify the owner of such failure and offer a 30 day grace period after which a Certificate of Non-compliance will be issued and recorded at the Registry of Deeds in the county where the dam lies, with all costs of recording, and interest thereon, to be assessed against the owner.

(5) Upon receipt and approval of the Dam Registration Form, a Certificate of Registration will be issued to each owner. Within 14 days of receipt such Certificate of Registration must be recorded by the owner at the Registry of Deeds in the county where the dam lies, and a copy of the recorded Certificate filed with the Commissioner within ten days of recording.

(6) The owner shall notify the Commissioner by registered or certified mail, of the proposed transfer of legal title of such dam 30 days prior to any such transfer. Upon receipt of such notice, a new Certificate of Registration will be issued. Such Certificate shall contain any outstanding obligations of the registered owner under M.G.L. c. 253, §§ 44 through 50.

10.06: Size and Hazard Classification

(1) General. Dams shall be classified for purposes of establishing inspection schedules and adherence to design criteria, in accordance with their potential for damage to life or property in the area downstream from the dam in the event of failure of the dam or appurtenant facilities. This determination shall be made by the Commissioner and noted on the owner's Certificate of Registration. It may be necessary to periodically reclassify dams as additional information becomes available and/or conditions change. The criteria established in 302 CMR 10.06(2) through (4) shall be used by the Commissioner to determine the size and hazard potential classification based upon the extent of development downstream from the dam, taking into consideration factors such as height, type of structure and volume of impoundment, pursuant to M.G.L. c. 253.

(2) Size Classification. The classification for size based on the height of the dam and storage capacity shall be in accordance with the Size Classification Table. The height of the dam is established as described in 302 CMR 10.06 with respect to maximum water storage elevation. The storage capacity of the dam is the volume of water contained in the impoundment at maximum water storage elevation measured as defined in 302 CMR 10.06(2). Size class may be determined by either storage or height, whichever gives the larger size classification.

10.06: continued

SIZE CLASSIFICATION TABLE

Category	Storage (acre-feet)	Height (feet)
Non-jurisdictional	Not in excess of 15 regardless of height	Not in excess of six regardless of storage capacity
Small	≥ 15 and <50	≥6 and <15
Intermediate	≥50 and <1000	≥ 15 and <40
Large	≥1000	≥40
For dams not in excess of 25 feet in height or having maximum impounding capacity not in excess of 50 acre-feet, the Commissioner shall make jurisdictional determination by taking into consideration factors or combination of factors such as height, type of structure, volume of the impoundment, extent of downstream development, and other factors deemed appropriate by the Commissioner.		

(3) Hazard Potential Classification. The classification for potential hazard shall be in accordance with the Hazard Potential Classification Table in 302 CMR 10.06(3). The hazards pertain to potential loss of human life or property damage in the event of failure of the dam or appurtenant works. Development of the area downstream from the dam that would be affected by its failure shall be considered in determining the classification. Dams will be subject to reclassification if the Commissioner determines the hazard has changed.

HAZARD POTENTIAL CLASSIFICATION TABLE

High Hazard (Class I):	Dams located where failure will likely cause loss of life and serious damage to home(s), industrial or commercial facilities, important public utilities, main highway(s) or railroad(s).
Significant Hazard	Dams located where failure may cause loss of life and damage home(s), industrial or commercial facilities, secondary highway(s) or railroad(s) or cause interruption of use or service of relatively important facilities.
Low Hazard (Class III):	Dams located where failure may cause minimal property damage to others. Loss of life is not expected.

(4) Dams in Series.

(a) If an upstream dam has the capability to create failure in a downstream dam because of its failure flood wave, it shall have the same or higher hazard classification as the downstream dam. If the failure flood wave of the upstream dam will not cause failure of the downstream dam, the upstream dam may have a different hazard potential classification from the downstream dam.

(b) The classification of each dam shall be reviewed during each subsequent periodic inspection.

(c) Potential damage to habitable structures will be considered minor when habitable structures are not within the direct path of the probable flood wave produced upon failure of a dam or where such structures will experience:

1. no more than 2.0 feet incremental rise of flood water above the lowest ground elevation adjacent to the outside foundation walls; or
2. no more than 2.0 feet incremental rise of flood water above the lowest habitable floor elevation of the structure; the lower of the two elevations governing.

(5) Failure Damage. The extent of potential damage resulting from a dam breach may justify designating damage as either major or minor. Such a designation may be made after a detailed analysis has established the relative impact of the probable dam breach and has considered the following factors:

10.06: continued

(a) the conditions prior to and after a dam breach;
(b) the extent to which access has been affected, both before and after a dam breach; and
(c) the extent of damage.

(6) Hazard Reconsideration. An owner may at any time request the Commissioner to reconsider the hazard determination. The owner's request must be filed by a registered professional civil engineer, specifying the findings and analyses with which the owner disagrees. The Commissioner will issue a written decision to the owner and the registered professional civil engineer within 30 days of receipt of a request for hazard reconsideration, and such decision shall be final and binding upon the parties.

10.07: Inspection Schedule

(1) Upon the failure of an owner to file a dam inspection report within the time prescribed, the Commissioner or his designee, in accordance with M.G.L. c. 253, § 47 may enter upon the property on which the Department's jurisdictional dam(s) and appurtenant works lie at any time to conduct any kind of dam safety evaluation(s) and/or action(s) as required, and/or to obtain the requisite information.

(2) The owner shall periodically inspect all dams in accordance with the following schedule. These time periods are the maximum time between inspections, more frequent inspections may be performed at the discretion of the Commissioner.

FORMAL INSPECTION FREQUENCY

Hazard Potential	Inspection Frequency
Low	ten years
Significant	five years
High	two years

ADDITIONAL INSPECTION FREQUENCY

High and Significant Hazard potential dams whose condition are determined to be poor and/or emergency by formal inspection must be inspected and reported on at least every six months by a registered professional engineer employed by the owner until the dam safety repairs are completed and the dam is found to be in satisfactory condition.

Any dam determined to be in an unsafe condition must be monitored at frequencies assuring the safety of the public.

Updates on the condition of the dam shall be provided by a registered professional engineer to the Office of Dam Safety and local emergency management officials until the dam is made safe.

(3) Inspections scheduled according to the time period set forth above, may be modified, at the discretion of the Commissioner, in special cases where it is desirable to observe a dam under particular conditions (*i.e.* wet season, dry season, foliage, *etc.*).

(4) The Commissioner may require scheduled inspections on a more frequent basis if particular conditions exist which require more frequent monitoring.

10.07: continued

(5) When the Commissioner reschedules the inspection of a particular dam for any reason cited in 302 CMR 10.07, the date of that inspection may become the starting date from which the date of the next regularly scheduled periodic inspection will be computed.

(6) The owner shall employ the services of a registered professional engineer experienced in the design, construction and inspection of dams, to inspect the owner's dam according to the inspection schedules determined by the Commissioner and on forms prescribed by the Commissioner.

(7) The owner shall furnish a copy of each completed inspection report in a format determined by the Commissioner within 30 days of the date of the inspection to the Commissioner.

(8) The inspection report shall be sealed by a registered professional engineer, as described herein.

(9) The owner must submit a statement of his or her intent to implement such recommendations of the registered professional engineer, if required.

(10) Upon review and approval of submitted inspection report, the Commissioner will determine compliance and appropriate procedure(s) in accordance with 302 CMR 10.08.

10.08: Compliance with Inspection Results

(1) The Commissioner shall determine whether the dam and appurtenant features meet accepted dam safety standards. If the Commissioner determines that the dam does not meet these standards and a threat to life and/or property exists, he shall issue a Certificate of Non-compliance. Certificates shall be recorded by the Commissioner with the Registry of Deeds for the county where the dam lies.

(2) A Certificate of Non-compliance shall be issued if the Commissioner determines that the dam or appurtenant features are unsafe, as defined under 302 CMR 10.06.

(3) If the Commissioner issues a Certificate of Non-compliance, after receiving the owner's inspection form, or at any other time, the Commissioner may order the owner of the dam to: cause a detailed inspection of the dam by a registered professional engineer, including such tests as the Commissioner may require or recommend to determine the course of action necessary to bring the dam into compliance and a time schedule by which the work shall be accomplished; or take whatever action is necessary to reduce the safety risk, as determined by the Commissioner.

(4) Notice of such aforementioned orders shall be served upon the owner(s) by registered or certified mail, return receipt requested, and recorded by the Commissioner in the Registry of Deeds in the county where the dam lies.

(5) When the dam meets minimum dam safety standards, or has been corrected or removed pursuant to an order by the Commissioner, the Commissioner shall issue a Certificate of Compliance to the owner.

(6) The Commissioner has the authority, pursuant to M.G.L. c. 253, § 47, and in accordance with the Memorandum of Understanding Between the DEP and the DCR relative to lake water level drawdowns/dam repair projects to determine the maximum allowable water elevation for reservoirs and impoundments where dams have been determined to be unsafe. In determining the maximum allowable water elevation, the Commissioner may consider the recommendations of a registered professional engineer representing the owner, if the owner has retained one. The owner shall not store water in excess of the stated elevation so determined by the Commissioner.

10.08: continued

(7) When the spillway capacity of the existing dam does not meet stated criteria a relative impact analysis may be required to be performed by the owner. This analysis will address such factors as: downstream impact area; capacity and/or condition of outlet work(s); overtopping potential; operation plans; consideration of incremental impacts of possible failure; and emergency action plans. Upon review and approval by the Commissioner a reduction in the standard design flood may be allowed to such dam.

10.09: Dam Construction, Repair, Alteration, Breach or Removal Permit

(1) General Application. Any person(s) who proposes to construct, repair, materially alter, breach or remove a dam, pursuant to M.G.L. c. 253, must file with the Commissioner a permit application to determine whether or not a Chapter 253 Dam Safety Permit is required. Routine maintenance-related work does not require a Chapter 253 Dam Safety Permit. Approved permits issued by the Commissioner do not relieve the applicant from required compliance with M.G.L. c. 131, § 40, and, where applicable, M.G.L. c. 131, §§ 5C and 19. Applications shall be sent by certified mail, return receipt requested. All permit applications must comply with DCR's standard design and construction criteria (*see* 302 CMR 10. 14). If the Commissioner determines that the proposed dam falls within the jurisdiction of 302 CMR 10.00, the owner must complete the construction, repair, alteration, breach or removal permit application as follows:

(a) Preliminary Report. The Permit application for any dam shall include a preliminary report. (Filing of the preliminary report prior to filing the final report, early in the site investigation and design schedule, is encouraged to assure the state's concurrence with the hazard classification, site investigation, and design concept.) The preliminary report shall be filed with the permit application and shall include, but not be limited to, the following information:

1. completion of all required information on the application;
2. maps showing the location of the proposed structure that include the county, location of state roads, access to site, and outline of the reservoir (aerial photographs or U.S. Geological Survey may be used);
3. preliminary drawings or sketches that include cross sections, plans and profiles of the dam, propose pool levels, and type of all spillways;
4. preliminary design criteria and basis for selection including a description of the size, ground cover conditions, and extent of development of the watershed, drainage area, spillway design storm, geology and geotechnical engineering assumptions for the foundation and embankment materials, and type of materials used in the principal spillway(s); and
5. book and page number of location of the dam as recorded in the Registry of Deeds with the name of the Registry.

(b) Final Design Report. Approval or denial of a permit to construct, repair, alter, breach or remove a dam will be issued within 60 days from the time the final design report and permit application is received. The final design report shall include, but may not be limited to, the following information:

1. a report of the investigation of the foundation soils or bedrock and the borrow materials, including the location of borrow areas, that are to be used to construct or repair the dam;
2. analysis and/or criteria to indicate that the dam will be stable during construction and filling and under all conditions of reservoir operations;
3. computations indicating that the dam is safe against overtopping during occurrence of the inflow design flood and wave action; wave action need not be considered when the design flood is based on the probable maximum precipitation (PMP);

10.09: continued

4. criteria, design data or references to indicate that seepage flow through the embankment, foundation, and abutments will be controlled to limit internal erosion and sloughing in the area where the seepage occurs;
5. calculations and assumptions relative to design of the spillway(s);
6. provisions to protect the upstream slope, crest, and downstream slope of earth embankments and abutments from erosion due to wind and rain;
7. other design data, assumptions and analysis data pertinent to individual dams and site conditions;
8. a proposed construction schedule;
9. a proposed filling schedule for the reservoir;
10. a maintenance and operation plan; and
11. for all new high and significant hazard potential dams, an emergency action plan to be implemented in the event of a dam failure.

The preliminary report and the final design report may be submitted as one document.

(2) Construction Documents. Two sets of plans and specifications must be submitted along with the Final Design Report. The documents shall be detailed engineering design drawings and specifications and that include the following at a minimum:

(a) sheet one showing the name of the project; name of owner; hazard classification of the dam; designated access to the project; and location with respect to highways, roads, streams, and any dam(s) that would affect or be affected by the proposed structure;
(b) maps showing the drainage area and outline of the reservoir and the ownership of properties covered by the reservoir or flood pools;
(c) geologic investigation, cross section, profiles, logs of borings, location of borrow areas, drawing of principal and emergency spillways, drawn in sufficient detail to clearly indicate the extent and complexity of the work performed;
(d) the technical provisions, as may be required, to describe the method of construction and quality control for the project; and
(e) special provisions, as may be required, to describe technical provisions needed to ensure that the dam is installed according to the approved plans and specifications.

(3) Notification. The Commissioner shall notify the applicant in writing within 60 days following the receipt of the completed application if the application is approved or disapproved. If the application is disapproved an explanation will be provided.

(4) Permit. Approval of construction, drawdown, repair, alteration, brief or removal of a dam will be contained in a Chapter 253 Permit to be issued by the Commissioner. A permit may be subject to written general stipulations and/or written specific stipulations deemed necessary by the Commissioner. No construction shall be performed until the permit is issued and recorded in the Registry of Deeds for the county within which the dam lies. The permit shall be valid for the construction schedule specified in the approved final design report and application. Construction must commence within two years after the permit is issued. If construction does not commence within two years after the permit is issued, the permit shall expire and a new application shall be submitted unless prior to the permit expiration date, upon written application and for good cause shown, the Commissioner extends the time for commencing construction.

(5) Recording a Chapter 253 Permit. A permit to construct, drawdown, repair, alter, breach or remove a dam shall be recorded at the Registry of Deeds in the county where the dam lies. Recording must be done prior to the commencement of construction and a copy of the recorded permit filed with the Commissioner.

10.09: continued

(6) Construction/Drawdown Notification. At least 21 days before construction or controlled drawdown is commenced, the owner shall provide notice by certified and/or registered mail to the Commissioner and the local Conservation Commission and to the Commonwealth Division of Fish and Wildlife, Field Headquarters, 1 Rabbit Hill Road, Westborough, MA 01581 attn: Natural Heritage and Endangered Species Section. When repairs are necessary to safeguard life and property, they may be started under the provisions of M.G.L. c. 253, § 47 upon notification by the Commissioner of an emergency condition. The owner shall assign a registered professional engineer to monitor any drawdown for the first four hours after its commencement, observing conditions at least on an hourly basis. Thereafter, the owner or his registered professional engineer shall monitor the drawdown at least once each 24 hours until drawdown has been completed. Emergency drawdowns in accordance with an order issued by the Commissioner excepted, to meet standards established by the Commonwealth Division of Fish and Wildlife drawdown rates should not exceed four cubic feet per second per square mile of drainage area (CFSM), as measured at the outlet structure. During reimpoundment, 0.5 cfsm should be maintained at the outflow.

(7) Entry. During construction the Commissioner or his designee may enter upon the property to inspect during construction without prior notice and may direct any additional testing or actions as required.

(8) Removal of Dams. If it is desirable to remove a dam due to new construction, abandonment or unsafe conditions, the owner shall be required to comply with 302 CMR 10.09 regarding the construction and repair of dams. Upon complete removal of the dam, the Commissioner will issue a Certificate of Approval stating that the removal has been in accordance with the approved plans and specifications, or any approved revisions thereof.

10.10: Revocation, Suspension, or Modifications of Chapter 253 Permits

Chapter 253 Permits may be revoked, suspended, modified or denied by the Commissioner for causes including but not limited to, the following:

(1) violation of any permit condition;

(2) failure to fully disclose all relevant facts or obtaining a permit through misrepresentation;

(3) violation of any provisions of M.G.L. c. 253, or 302 CMR 10.00 *et seq.*;

(4) change or newly discovered condition or circumstance that makes or would make the dam unsafe; or

(5) change of conditions develop that are hazardous to life and/or property.

10.11: Emergency Action Plans

(1) All dams classified or reclassified as high hazard potential shall have an Emergency Action Plan ("EAP"). If the Commissioner requires it, the owner of a non-high hazard potential dam shall also be required to provide an EAP. Approval to construct a new significant hazard potential dam or high hazard potential dam shall be contingent upon the submission of an EAP to the Commissioner. All EAP's are subject to approval by the Commissioner. The EAP shall, at a minimum, contain the following:

(a) the identification of equipment, manpower and material available for implementation of the plan;

(b) a notification procedure for informing the local emergency agencies;

(c) a dam failure inundation map for high hazard potential dams and a topographic map for significant hazard potential dams showing the stream which will be flooded; and

(d) a procedure for warning nearby local residents if failure of the dam is imminent and a listing of addresses and telephone numbers of downstream residents who may be affected by the failure of the dam.

10.11: continued

(2) Prior to submission of an EAP to the Commissioner, the owner shall submit a copy of the proposed EAP to the local and state emergency agencies, and all local emergency coordinators involved in the plan, for review. The owner shall submit with the EAP, recommendations received from said agencies and coordinators, if any.

(3) Annually, the owner shall review the EAP, update it and provide the updated EAP to all involved agencies for review.

(4) EAP'S shall be provided by the owner in both hard copy and electronic format to the Commissioner and the Massachusetts Emergency Management Agency.

10.12: Records

Upon request by the Commissioner, an owner shall make available for inspection and review, all plans, specifications and other such pertinent material relating to the dam. The Commissioner shall return all such material upon completion of his inspection.

10.13: Liability

(1) The owner shall be responsible and liable for damage to property of others or injury to persons, including but not limited to loss of life, resulting from the operation, failure of or misoperation of a dam.

(2) 302 CMR 10.00 shall not relieve from or lessen the responsibility of any person owning, or operating a dam from any damages to persons or property caused by defects, nor shall the Commissioner be held liable by reason of any inspections or permits issued.

10.14: Design and Construction Criteria for New and Existing Dams

(1) General. Design and construction of dams shall comply with 302 CMR 10.14. Design and construction standards that are not included in 302 CMR 10.14, shall conform to design procedures established by: The U.S Army Corps of Engineers, the U.S. Bureau of Reclamation, the U.S. National Resource Conservation Agency and other generally accepted engineering practices and principles. Where specific site conditions may exist which warrant appropriate changes in the following design and construction criteria, the Commissioner shall review and approve the design.

(2) Foundations and Abutments. The foundations and abutments investigation shall consist of borings, test pits, and other subsurface exploration necessary to assess the soil, rock, and groundwater conditions.

(3) Construction Materials. Specifications for construction materials shall establish minimum acceptance criteria so that anticipated design properties are achieved. If the use of on site borrow materials is specified, exploration, testing, and calculations shall be performed to indicate that there are sufficient quantities of material available that meet the design criteria.

(4) Surveys. Surveys shall be made with sufficient accuracy and scale to locate the proposed construction and to define the volume of the storage in the reservoir. The downstream area shall be investigated in order to delineate the area of potential damage in case of failure. Locations of centerlines, and other horizontal and vertical control points, shall be shown on a map of the site.

(5) Hydrologic Investigation. The drainage area shall be determined. Present land use shall be considered in determining the runoff characteristics of the drainage area. All hydrologic assumptions and design calculations shall be included in the report.

10.14: continued

(6) Spillway Design.

(a) The spillway system shall have a capacity to pass a flow resulting from a design storm, as indicated in the following table, unless the applicant provides calculations, designs and plans to show that the design flow can be stored, passed through, or passed over the dam without failure occurring.

SPILLWAY DESIGN FLOOD
DESIGN STORM

Hazard	Size	Existing Dams	New Dams
Low	small intermediate large	50 year 50 year 100 year	100 year 100 year 100 year
Significant	small intermediate large	100 year 100 year 500 year	500 year 500 year ½ PMF
High	small intermediate large	500 year ½ PMF ½ PMF	PMF PMF PMF

(b) Vegetated earth or unlined emergency spillway(s) will be approved when computations indicate that it will pass the design flood without jeopardizing the safety of the structure. The risk of recurring storms, excessive erosion, and inadequate vegetative cover will be considered acceptable in such a spillway when its average frequency of use is predicted to be no more than indicated in the following table.

EMERGENCY SPILLWAY FREQUENCY TABLE

Hazard	Size	Existing Dams	New Dams
Low	small intermediate large	25 years 25 years 25 years	25 years 25 years 25 years
Significant	small intermediate large	25 years 25 years 50 years	50 years 50 years 50 years
High	small intermediate large	50 years 50 years 100 years	100 years 100 years 100 years

(c) The Department recognizes that the relationships between valley slope and width, total reservoir storage, drainage area, and other hydrologic factors have a critical bearing on determining the safe spillway design flood. Rational selection of a safe spillway design flood for specific site conditions based on quantitative and relative impact analysis is acceptable. The spillway should be sized so that the increased downstream damage resulting from an overtopping failure of the dam would not be significant when as compared with the damage caused by the flood in the absence of dam overtopping failure. In lieu of quantitative and relative impact analysis, the preceding table shall be used as spillway design criteria.

(d) Lined Spillways and Channels. The design report shall include design data criteria for open channel, drop, ogee, and chute spillways and other spillway types that include crest structures, walls, channel linings, and miscellaneous details. All masonry or concrete structures shall have joints that are relatively water tight and shall be placed on foundations capable of sustaining applied loads without undue deformation. Provisions must be made for handling leakage from the channel or under seepage from the foundation which might cause saturation of underlying materials or uplift against the undersurfaces.

10.14: continued

(7) Conduits.

(a) A conduit shall be provided to drain each reservoir. Any new and/or existing conduit design shall include the computation of the minimum time required to drain the reservoir.

(b) All pipe conduits shall convey water at the design velocity without damage to the interior surface.

(c) Protection shall be provided to prohibit unsafe seepage along conduits through the dam, abutments, and foundations. The specific design for seepage protection along conduits shall be shown in the drawings and specifications.

(d) Adequate allowances shall be incorporated in the design to compensate for differential settlement and possible elongation of the pipe conduit.

(e) Trash racks shall be installed at the intake of conduits to prevent clogging the conduit.

(f) Pipe Conduit Materials:

1. Pipe conduits shall be designed to support the total external loads in addition to the total internal hydraulic pressure without leakage.

2. Reinforced or Prestressed Concrete Pipe Conduits.

a. All conduits shall be designed and constructed to remain watertight under maximum anticipated hydraulic pressure and maximum probable joint opening, including the effects of joint rotation and extensibility.

b. Provisions for safe movement of the barrel shall be provided at each joint in the barrel and at the junction of the barrel and riser or inlet. Cradles shall be articulated if constructed on a yielding foundation.

c. The owner's engineer shall submit the final design details of the proposed pipe to be used for all significant and high hazard potential dams.

3. Corrugated Metal Pipe Conduits.

a. Corrugated metal pipe shall not be used in any dam, except for special cases where the design engineer can adequately demonstrate satisfactory performance. Any exemption which allows their use must be issued in writing by the Commissioner.

4. Dissipating Devices. All gates, valves, conduits and concrete channel outlets shall be provided with a dissipater designed and constructed to control erosion and prevent damage to the embankment or the downstream outlet or channel.

5. In the case of repair to an existing dam, the owner's engineer may determine that the conduit should not be repaired or replaced and shall submit reasons to support this determination in the application for the Chapter 253 Permit to repair.

(8) Seepage Control.

(a) All dams shall be designed and constructed to prevent the development of instability due to excessive seepage forces, uplift forces, or loss of materials in the embankment, abutments, spillway areas, or foundation. Seepage analyses for design shall identify areas having high internal uplift or exit gradients.

(b) The design shall include an embankment internal drainage system, a zoned embankment, a foundation cut-off, an upstream blanket, a sufficiently wide homogeneous section, or other methods to protect against instability from excessive seepage forces or high hydraulic gradients.

(c) For high hazard potential dams, a flow net analysis shall be made to determine the location of the phreatic surface, flow lines, and equipotential lines within the embankment and its foundation. These analyses may be based on graphical construction, electrical or liquid analogs, soil prototype methods, or other generally accepted methods. The flow net and stability analysis shall be the maximum water storage elevation. Possible fluctuations in tail water elevation shall be included in the analysis. The flow net and seepage analysis shall be included in the final design report.

(d) Piezometers for confirming the location of the phreatic surface assumed for seepage and slope stability analyses shall be considered by the design engineer for low and significant hazard potential dams and shall be required for high hazard potential dams. Where piezometers are required, their design, depths and locations shall be provided in the final design report.

10.14: continued

(9) Structural Stability and Slope Protection.

(a) Design and construction of dams to assure structural stability shall be consistent with accepted engineering practice. The scope and degree of precision that will be required for a specific project will depend on the conditions of the site and the damage potential of the proposed structure. Consideration in design for structural stability shall include, but are not necessarily limited to, the following:

1. The hazard potential of the dam under present downstream conditions and under conditions which would likely develop during the life of the reservoir;
2. foundation bearing capacity, compressibility, and permeability; the extent and reliability of the site investigation; and the predictability of the site and foundation conditions;
3. the reliability of construction materials, such as borrow soils, in terms of sufficient volume to complete construction without unanticipated interruption and in terms of predictability of physical properties such as strength, permeability, and compressibility;
4. durability of construction materials;
5. construction conditions at the site;
6. the degree of quality control to be exercised during construction;
7. pore pressure build-up during construction;
8. the rate of filling the reservoir and the rate of possible reservoir drawdown;
9. tailwater conditions and the impact of drawdown;
10. possible effects of landslides and subsurface solution activity on the structural stability of the dam and spillway structures; and
11. the extent of of the proposed use of piezometers and other devices which will be used to monitor the completed dam and the means of access for inspections.

(b) Slope stability analysis shall be considered by the design engineer for all embankment dams and are required for high hazard potential dams. Where slope stability analysis is required documentation in the final design report, such analysis shall include the design cross section(s) showing the soil parameters assumed for analysis, the location of the phreatic surface assumed for analysis, stability computations, and the location and computed safety factor(s) for the most critical circle(s) or failure wedge(s).

(c) Minimum factors of safety are listed in the following table. Final accepted factors of safety may depend upon the degree of confidence in the engineering data available. In selecting a minimum acceptable factor of safety, an evaluation should be made on both the degree of conservatism with which assumptions were made in choosing soil strength parameters and pore water pressures, and the influence of the method of analysis which is used.

1. 302 CMR 10.14(8)(c) shall not be applicable to embankments on clay shale foundations, soft sensitive clays, or materials with large strength loss under stresses.
2. For embankments over 50 ft. high on relatively weak foundations, a minimum factor of safety of 1.4 shall be used.

10.14: continued

SLOPE STABILITY ANALYSIS
MINIMUM FACTORS OF SAFETY

Loading Condition	Minimum Factor of Safety Analyzed	Slope to be
End of construction condition	1.3	upstream and downstream
Sudden drawdown from maximum pool	>1.1*	upstream
Sudden drawdown from spillway crest or top of gates	1.2	upstream
Steady seepage with maximum storage pool	1.5	upstream and downstream
Steady seepage with surcharge pool	1.4	downstream
Earthquake (for steady seepage conditions with seismic loading using seismic coefficient method)	>1.0	upstream and downstream

(d) Foundation bearing capacity and sliding base analysis shall be considered for all dams and are required for high hazard dams. Where bearing capacity or sliding base analysis is required, documentation of assumptions, computations, and safety factors shall be included in the final design report.

(e) Resistance of appurtenant structures against flotation uplift shall be provided for all dams. If the structures are anchored by dead weight alone, the buoyant weight shall be used for analysis. If the structures are anchored to soil or rock, the minimum factor of safety for that portion of the resistance provided by soil or rock anchorage shall be 2.0 unless the design engineer provides a thoroughly documented basis for using a lower safety factor.

(f) For concrete, masonry, or other similar dams of relatively narrow cross section, resistance against overturning and sliding under maximum design loading conditions shall be considered; overturning and sliding stability computations shall be required for significant and high hazard dams.

(g) The anticipated reservoir and tailwater drawdown conditions shall be considered in all stability computations and shall be included in the design documents provided in the final design report.

(h) The slopes shall be protected against erosion by wave action, and the crest and downstream slope shall be protected against erosion due to wind and rain. Riprap and other erosion protection shall be provided over the full range in stage between the lowest drawdown elevation and at least two feet above maximum water storage elevation. Exemptions for specific site conditions, slowly rising reservoirs, such as waste storage facilities, may be approved in writing by the Commissioner upon written request by the Applicant.

(i) All significant and high hazard potential dams shall be designed to withstand seismic accelerations of the following intensities: Zone 1 = 0.025 g., Zone 2 = 0.05 g., Zone 3 = 0.15 g. Zones refer to "Geologic Hazard Maps".

(j) Loading Combinations. The following conditions and requirements are suitable in general for gravity dams of intermediate size. Loads which are not indicated such as wave action, or any unusual loadings should be considered where applicable.

*The factor of safety shall not be less than 1.5 when drawdown rate and pore water pressures developed from flow nets are used in the stability analyses and where rapid drawdown is a normal operating condition as with pumped storage reservoir.

10.14: continued

Case I: Usual Loading Combination--Normal Operating Condition The reservoir elevation is at the normal pool, as governed by the crest elevation of an overflow structure or the top of the closed spillway gates, whichever is greater. Normal tailwater is used. If applicable, horizontal silt pressure should be also be considered.

Case II: Unusual Loading Combination--Flood Discharge The projected inflow design flood up to and including the Probable Maximum Flood, if appropriate, that results in reservoir and tailwater elevations that exert the greatest head differential and uplift pressure upon the structure shall be used. However, unusual conditions, such as high tailwater, shall be examined on a case by case basis as it is possible that the worst case loading condition exists under other than extreme floods.

Case IIA: Unusual Loading Combination--Ice Case I loading plus ice pressure, if applicable. Generally ice pressure will not be a factor in the stability analyses, but may affect the operation, or structural integrity of flashboards and spillway gates.

Case III: Extreme Loading Combination--Normal Operating with Earthquake Case I loading except that the inertial force due to the earthquake acceleration of the dam, and the increased hydrostatic forces due to the reservoir reaction on the dam are added.

(k) Stability Criteria. Specific stability criteria for a particular loading combination shall be dependent upon the type of analysis being done (i.e. foundation or concrete analysis), the degree of understanding of the foundation-structure interaction and site geology, and, to some extent, on the method of analysis.

1. For new dams, preliminary analyses shall be based upon more conservative criteria than final designs. As the design process progresses the designer has available more sophisticated, and detailed, foundation information and material testing results. Therefore, when the unknowns associated with the preliminary designs are reduced by the final design stage, lower safety factors may be acceptable.
2. For existing dams, assumptions used in the analysis shall be based upon construction records and the performance of the structures under historical flood loadings. In the absence of available design data and records, site investigations shall be conducted to verify all assumptions.
3. Recommended safety factors shall apply to the calculations of stress and the shear-friction factor of safety within the structure, at the rock/concrete interface and in the foundation. Safety factors shall be determined using the gravity method of analysis.

RECOMMENDED FACTORS OF SAFETY Dams having a high or significant hazard potential.	
Loading Condition	Factor of Safety
Usual Unusual Extreme	3.0 2.0 >1.0

Dams having a low hazard potential.

Loading Condition	Factor of Safety
Usual Unusual Extreme	20 1.25 >1.0

(10) Design Life of a Dam. The selection of materials and equipment to be used in a dam and all of its appurtenant features shall either be based on sufficient quality and durability to function satisfactorily throughout the design life or to provide for safe and economical replacement within the design life span.

10.14: continued

The design life of a dam shall be the period of time the dam can be expected to perform effectively as planned. The design life of a dam shall be determined by the following:

(a) the time required to fill the reservoir with sediment from the contributing watershed;
(b) the durability of appurtenances and materials used to construct the dam; and
(c) the time required to perform the specific function for which the dam was designed.

(11) Additional Design Requirements.

(a) All elements of the dam shall conform to good and generally accepted engineering practice. The safety factors, design standards, and design references that are used shall be included in the final design report.

(b) Monitoring or inspection devices may be required by the Commissioner for use by the inspectors or owners during construction and filling and after completion of construction. The Commissioner may also require that such monitoring or inspection devices, existing or installed by requirement, be read and documented at specified intervals and that copies of such be forwarded to his office.

(12) Construction Schedule. The applicant shall submit a construction schedule that includes:

a) suggested techniques and work force to be used to demonstrate that the dam will be constructed according to the plans and specifications;
(b) an estimated time to complete the construction activities;
(c) techniques to be used to divert the stream flow to prevent interference with construction; and
(d) the extent and method of quality control.

(13) Proposed Changes In Design. The owner shall notify the Commissioner in writing of any proposed changes in design, plans, and specifications that will affect the stability of the dam. Approval shall be in the form of a written addendum to the Chapter 253 Permit and must be obtained prior to installation.

(14) As-built Plans. Two complete sets of as-built plans shall be submitted to the Commissioner within 30 days of completion of the project.

(15) Engineer's Certification. The registered professional civil engineer who has inspected the construction of the dam, shall submit a written statement bearing his/her professional seal that the dam and all appurtenances have been built, repaired, altered, or removed in conformance with the plans, specifications, and drawings approved by the Commissioner and that the dam is in compliance with 302 CMR 10.00. For repairs accomplished, the certification shall be for the repairs only.

(16) Acceptable Design: Procedures and Technical References. The following represent acceptable design procedures and references:

(a) the design procedures, manuals and criteria used by the United States Corps of Engineers;
(b) the procedures, manuals, and criteria used by the United States Soil Conservation Service;
(c) the procedures, manuals, and criteria used by the United States Bureau of Reclamation; and
(d) other procedures that are approved by the Commissioner.

(17) Granting of Final Approval. Unless the Commissioner has reason to believe that the dam, on completion, is unsafe or not in compliance with any applicable requirement, regulation, or law, or of any condition or specification contained within the Permit, upon completion of construction and upon receipt of the engineer's statement, the Commissioner shall grant final approval of the work and shall issue a Certificate of Compliance, subject to such terms as he deems necessary for the protection of life and property.

E.21. Michigan

DEPARTMENT OF ENVIRONMENTAL QUALITY

LAND AND WATER MANAGEMENT

DAM SAFETY

(By authority conferred on the department of natural resources by section 57 of Act No. 300 of the Public Acts of 1989, being S281.1357 of the Michigan Compiled Laws)

R 281.1301 Definitions.

Rule 1. (1) As used in these rules, "Act" means Act No. 300 of the Public Acts of 1989, being S281.1301 et seq. of the Michigan Compiled Laws.

(2) Terms defined in the act have the same meanings when used in these rules.

History: 1993 AACS.

R 281.1302 Permit applications and procedures.

Rule 2. (1) An application for a permit for a proposed project shall be made on a form that is prescribed and provided by the department. The application form shall be the same form that is used for other department-administered statutes that require permits at the land-water interface. Application forms may be obtained from the land and water management division or from any district or regional office of the department.

(2) An application fee for a permit to repair, alter, remove, or abandon a dam shall be submitted with the application form. Submission of an application fee for a permit to construct, reconstruct, or enlarge a dam may be deferred until plans and specifications are submitted. The fee for enlargement of a dam that is part of a mine tailings basin system shall be based on the height of the new embankment section as measured by the vertical distance from the lowest point of the embankment crest to the lowest tailings foundation elevation. The fee shall be paid by check, money order, or draft made payable to: "State of Michigan".

(3) When the proposed project includes related multiple impoundments, an applicant may apply for a single permit, but an appropriate fee shall be required for each impoundment.

(4) An application for a permit to construct a new dam, enlarge an existing dam, or reconstruct a failed dam shall be reviewed by the department in a 2-step process. The first step shall be a review of the conceptual plans to determine if the proposed project may have a significant adverse effect on public health, safety, welfare, property, or natural resources or the public trust in those natural resources. The second step shall be the review of plans and specifications to determine if the engineering design is acceptable.

(5) An application for a permit to construct a new dam, enlarge an existing dam, or reconstruct a failed dam shall include all of the following:

(a) A description and evaluation of the loss of natural resources that are associated with the project.

(b) A description of the natural resources that are associated with or created by the impoundment and how they offset the natural resources lost by the creation of the impoundment.

(c) The project assessment required pursuant to the provisions of R 281.1304. However, an assessment is not required for a permit to enlarge an

existing dam when the purpose of the impoundment will remain the same as the original impoundment and the surface area of the impoundment will be increased by 10% or less.

(d) Conceptual plans that are adequate to evaluate the project's impacts on public health, safety, welfare, property, or natural resources or the public trust in those natural resources. Conceptual plans shall include, at a minimum, all of the following:

(i) A site plan that shows all of the following:

(A) The location of the dam.

(B) The existing stream channel.

(C) The normal shoreline of the proposed impoundment.

(D) Property lines.

(E) Dimensions or proper scale.

(ii) Transverse and longitudinal cross-sections through the dam that show all of the following:

(A) The spillway or spillways.

(B) Upstream and downstream water levels.

(C) The stream channel bottom.

(iii) The location of all occupied dwellings within 1/4 of a mile of the proposed impoundment if the dam is new or if the impoundment elevation is changed. Projects that do not propose an impoundment elevation change are excluded from this requirement.

(iv) Ingress and egress routes for construction activities.

(6) The first step of the review shall commence once the department has received all of the following:

(a) The application form with all necessary information filled in.

(b) All additional information requested by the department that is required to evaluate the proposed activity's effects on the public health, safety, welfare, property, or natural resources or the public trust in those natural resources. Requests by the department for additional information shall be made in writing.

(c) All appropriate application fees, except as noted in subrule (2) of this rule.

(d) The assessment described in R 281.1304 when required pursuant to the provisions of subrules (5) and (7) of this rule.

(e) Conceptual plans for the project as described in this subrule and subrules (5), (7),and (8) of this rule.

Engineering plans and specifications are not required for the department to complete the first step of the review.

(7) An application for a permit to abandon or remove a dam shall include all of the following:

(a) A site plan that shows all of the following:

(i) The location of the dam.

(ii) The impoundment.

(iii) The existing stream channel.

(iv) The proposed location of the stream channel.

(b) A description of the method to be employed in removing or abandoning the dam.

(c) An evaluation of the capacity of the remaining structure to pass flood flows after the proposed work is completed, including hydraulic computations to support the evaluation.

(d) An evaluation of the quantity and quality characteristics of the sediments that have accumulated in the dam impoundment.

(e) A description of the methods to be employed to control sediments during and after removing or abandoning the dam.

(f) The project assessment required pursuant to the provisions of R 281.1304.

(8) An application for a permit to repair or alter a dam shall include both of the following:

(a) A description of the proposed work, including the volumes of materials to be dredged or filled.

(b) Engineering plans and specifications for the proposed work.

(9) After receipt of an application, the department may request, in writing, from the applicant, such additional information, assessment, design calculations, records, or documents as are determined to be necessary to evaluate the proposed project.

(10) Based in part on the information provided by the applicant and in part on comments received by the department during the 20-day comment period as provided by section 23 of the act, the department shall conduct the first step of the review to determine the effects of the proposed project on public health, safety, welfare, property, or natural resources or the public trust in those natural resources and riparian rights. The department shall make 1 of the following determinations:

(a) The proposed activity is permitable as submitted.

(b) The proposed activity is permitable if certain described modifications are made.

(c) The proposed activity is not permitable and cannot be modified to result in the granting of a permit.

(11) An application for a permit shall not be considered complete until the assessment required in R 281.1304 has been completed and the department has received all of the following:

(a) All information that is requested on the application form.

(b) Any other information that is required by written notice from the department.

(c) The application fee, unless the fee is deferrable pursuant to the provisions of subrule (2) of this rule.

(d) Acceptable conceptual plans and specifications.

The department shall grant or deny a permit within 60 days after the submission of a complete application or within 120 days after the submission of a complete application if a public hearing is held.

(12) An application shall be considered to be withdrawn and the file for the application shall be closed if an applicant fails to respond to any written inquiry or request from the department within 30 days of the request. If the applicant cannot provide the specific information that the department requests within the 30-day period, the applicant may keep the application open by advising the department, in writing, within the 30-day period, of when the information can be submitted. The applicant's proposed deadline shall be reasonable. If the information is not provided by the applicant's deadline, the application shall then be closed.

(13) The department shall advise an applicant of its determination. If an activity is permitable as submitted or is permitable if modified, the department shall then review engineering plans and specifications. If the department has not yet received required application fees or engineering plans and specifications, the department shall request the fees or plans and specifications at the time an applicant is advised of the department's determination.

(14) When the department determines that engineering plans and specifications are acceptable, a permit shall be issued or, if a permit has already been issued, the applicant shall be notified, in writing, that plans and specifications are acceptable and the project may commence. If the engineering plans and specifications are determined to be unacceptable, the department shall advise the applicant of why the plans and specifications are unacceptable and provide a concise written statement explaining how the plans and specifications may be corrected.

History: 1993 AACS.

R 281.1303 Permit conditions.

Rule 3. (1) A permit shall provide that the work authorized by the permit shall be completed within a specified time period, which shall not be more than 2 years after the date that the permit is issued. Extensions of time of up to 2 years each may be granted by the department for good cause shown by the applicant. An administrative fee shall not be required for an application for extensions of time.

(2) A permit does not obviate the necessity of receiving approval from the United States army corps of engineers, when applicable, the state department of public health, or a local unit of government, when applicable, including a local unit of government that is responsible for administering the provisions of Act No. 245 of the Public Acts of 1970, as amended, being S281.631 et seq. of the Michigan Compiled Laws, and Act No. 347 of the Public Acts of 1972, as amended, being S282.101 et seq. of the

Michigan Compiled Laws.

(3) The department shall not issue a permit, except for a permit pursuant to the provisions of section 25(2) of the act or a permit under a minor project category, until 20 days after the mailing of the list to each eligible subscriber as provided for in sections 21(1) to (3) and 23(1) of the act.

(4) Upon request, the department shall provide any person with a copy of a permit application and supporting documents pursuant to the provisions of Act No. 442 of the Public Acts of 1976, as amended, being S15.231 et seq. of the Michigan Compiled Laws.

(5) If the mitigation proposed in a mitigation plan that is submitted by an applicant is approved by the department, the department may incorporate the mitigation actions as permit conditions for the improvement of the existing resources or the creation of a new resource to offset resource losses that result from the proposed project.

(6) A temporary emergency action plan may be required by permit condition which would be effective during, and applicable to, the construction period.

History: 1993 AACS.

R 281.1304 Project assessment.

Rule 4. (1) In each application for a permit as required pursuant to the provisions of R 281.1302, (5) and (7), an assessment of all known existing and potential adverse effects within the scope of the project shall be provided by the applicant and reviewed by the department to determine whether the project will have a significant adverse effect on public health, safety, welfare, property, or natural resources or the public trust in those resources. This assessment shall include evaluations of both positive and negative impacts of the project commensurate with the scope of the project and mitigating measures to minimize impacts on all of the following:

(a) Wetlands.
(b) Fisheries.
(c) Wildlife.
(d) Threatened and endangered species.
(e) Water quality.
(f) Streamflows.
(g) Sediment transport.
(h) Turbidity.
(i) Water chemistry.
(j) Water temperature.
(k) Riparian rights.

The assessment shall include impacts of the impoundment on the stream below the impoundment and shall address impacts both during construction and after completion of the project.

(2) If the department determines that more detailed study is needed, it may require the applicant to provide the additional information or cause such a study to be made. The department shall state, with specificity, in writing, the requirements or criteria for such additional information or study. All available data shall be evaluated by the department in its review of an application for a permit.

History: 1993 AACS.

R 281.1305 Engineering plans and specifications.

Rule 5. (1) Engineering plans and specifications for the construction of new dams, the reconstruction of failed dams, or the enlargement of dams shall be prepared by a licensed professional engineer, be submitted to the department, be approved by the department before the commencement of construction, and include, at a minimum, all of the following:

(a) A map that shows the location of the project and a topographic map of the dam site and impoundment area. Mapping shall show all of the following:

(i) Maximum flood storage elevations of the impoundment.
(ii) Property boundaries of the site, including flowage easements.
(iii) Borrow area or areas.
(iv) Ingress and egress routes.
(v) Work limits.
(b) Detailed design plans that show all of the following:
(i) A profile along the centerline of the embankment and the spillway or spillways.
(ii) Cross-sections of the dam at representative locations that show suitable detail of the upstream and downstream slopes and crest.
(iii) The findings of investigations and analyses of embankment and foundation materials, including the locations of soil borings, soil boring logs, and proposed foundation treatment.
(iv) Other drawings that are necessary to fully depict the project as determined by the department upon consultation with the applicant.
(v) Other analyses that are necessary to document the adequacy of the design of the structure and protection of natural resources, public safety, and public trust as determined by the department upon consultation with the applicant.
(c) An operation plan that describes how the streamflows will be maintained under various conditions.
(d) Technical specifications related to the scope of work for the dam and appurtenant structures. Specifications shall reference nationally recognized and acceptable engineering specifications.
(2) Engineering plans and specifications for the repair, alteration, removal, or abandonment of a dam, with the exception of minor alteration or repair projects, shall be prepared by a licensed professional engineer, be submitted to the department, and be approved by the department before commencement of construction. Plans and specifications for repair and alteration shall include sufficient detail and analyses for the department to determine whether the proposed activity adequately protects the structural integrity of the dam. Plans and specifications for removal and abandonment of a dam shall include sufficient detail and analyses for the department to determine whether the proposed activity adequately protects natural resources, public safety, and the public trust.
(3) The hazard potential classification and spillway design flood determination of a dam site shall be determined by the department. The department may require the applicant to provide additional information for the department's use in these determinations. Spillway capacity requirements are fulfilled if the specified design flood is stored in the impoundment, attenuated in the impoundment system, or passed through the spillway.
(4) When mitigation for the loss of natural resources is required for a proposed activity, plans and specifications for the mitigation may be required.

History: 1993 AACS.

R 281.1306 Minor project categories.
Rule 6. (1) The department shall grant or deny an application for a minor project after all of the following steps have been completed:
(a) Submission of a complete application.
(b) An on-site inspection by a department representative.
(c) A review of all appropriate information by the department.
(2) A review of a minor project does not require any of the following:
(a) Submission of the application materials by the department to any of the individuals or agencies listed in section 23(1) of the act.
(b) A 20-day comment period as provided for in section 23 of the act.
(c) A public hearing.
(3) Required plans and specifications for a minor project do not need to be prepared by a licensed professional engineer.
(4) The following alterations and repairs shall be considered minor projects pursuant to section 27 of the act if the activity involves a temporary drawdown of 2 feet or less or involves a temporary drawdown where the dam owner is the sole riparian to the lands surrounding the

impoundment:
(a) Dredging or filling of more than 25 cubic yards, but less than 300 cubic yards, as a single and complete project. For dredging projects, the project will not be considered minor unless evidence is provided with the application that the materials to be dredged are not contaminated pursuant to the provisions of Act No. 64 of the Public Acts of 1979, as amended, being S299.501 et seq. of the Michigan Compiled Laws.
(b) Erosion protection measures that fulfill an identifiable need for erosion protection, bank stabilization, or the protection or improvement of the dam and its inlet and outlet channels. The fill material that is associated with erosion protection measures shall be in compliance with any of the following provisions:
(i) It shall have a volume of more than 25 cubic yards, but shall not have a volume of more than 300 cubic yards.
(ii) It shall not have a surface area of more than 10,000 square feet.
(iii) There shall not be more than 2 cubic yards per lineal foot.
(c) Other repairs and alterations that have a minimal effect on the structural integrity of the dam.
(5) Dredging or filling in volumes of less than 25 cubic yards shall be considered maintenance and does not require a permit pursuant to the provisions of the act.

History: 1993 AACS.

R 281.1307 Performance bonds.
Rule 7. (1) As authorized by the provisions of section 31(5) of the act, a permit to construct a new dam or reconstruct a failed dam may require a performance bond. A performance bond may be in the form of any of the following:
(a) A surety bond.
(b) A secured trust fund.
(c) A letter of credit.
(d) Insurance.
(e) A financial test.
(f) A corporate guarantee.
(g) Another suitable instrument or mechanism.
(h) A combination of the items listed in subdivisions (a) to (g) of this subrule as approved by the department.
The department shall consider an applicant's past performance in determining if a performance bond shall be required.
(2) The performance bond shall be secured and documentation shall be submitted to the department before the commencement of construction. The bond, instrument, mechanism, or fund or combination of these methods of assurance shall be in the amount equal to a reasonable estimate of the cost, adjusted for inflation, that is required to adequately complete a project or remove a completed or partially completed dam and to provide for complete or partial restoration of a project site. Performance bonds may be required in the following instances if there is a reasonable possibility that the permittee may not complete the project:
(a) Where total project completion is essential for the protection of public health, welfare, or safety or to protect natural resources and the public trust in those natural resources.
(b) For temporary dams or dams that are constructed or reconstructed for a specific purpose and period of time after which removal is planned.
(c) For phased construction projects where dam construction or reconstruction is an integral and necessary part of the total project and is to be phased in over a number of years.
(d) Projects to be constructed in the future to mitigate the loss of natural resources or environmental degradation.

History: 1993 AACS.

R 281.1308 Project completion explained.
Rule 8. Pursuant to the provisions of section 35(1)(a) of the act,

completion of a new, reconstructed, enlarged, repaired, or altered dam occurs when all the work depicted on all approved drawings and all specification requirements have been accomplished and all permit conditions have been implemented before the expiration of a permit.

History: 1993 AACS.

R 281.1309 Inspection schedule.

Rule 9. Inspection reports that are prepared pursuant to the provisions of R 281.1310 are due on a calendar year basis. The department shall notify the dam owner of the due date, by certified mail, not later than January 31 of the year in which the inspection report is due. In establishing an inspection schedule, as authorized pursuant to the provisions of section 37(2) of the act, the department shall compile an alphabetical listing of dams in each hazard potential classification of high, significant, and low. The inspection schedule shall be established based on the following provisions:

(a) For high hazard potential dams, every third dam in the alphabetical listing of these dams shall be inspected each year as follows:

(i) The first, fourth, seventh, tenth, and so on dam in the alphabetical listing will be due for inspection the first year.

(ii) The second, fifth, eighth, eleventh, and so on dam in the alphabetical listing will be due for inspection the second year.

(iii) The third, sixth, ninth, twelfth, and so on dam in the alphabetical listing will be due for inspection the third year.

(iv) The cycle shall be repeated every 3 years.

(b) For significant hazard potential dams, every fourth dam in the alphabetical listing of these dams shall be inspected each year as follows:

(i) The first, fifth, ninth, thirteenth, and so on dam in the alphabetical listing shall be due for inspection the first year.

(ii) The second, sixth, tenth, fourteenth, and so on dam in the alphabetical listing shall be due for inspection the second year.

(iii) The third, seventh, eleventh, fifteenth, and so on dam in the alphabetical listing shall be due for inspection the third year.

(iv) The fourth, eighth, twelfth, sixteenth, and so on dam in the alphabetical listing shall be due for inspection the fourth year.

(v) The cycle shall be repeated every 4 years.

(c) For low hazard potential dams, every fifth dam in the alphabetical listing of these dams shall be inspected each year as follows:

(i) The first, sixth, eleventh, sixteenth, and so on dam in the alphabetical listing shall be due for inspection the first year.

(ii) The second, seventh, twelfth, seventeenth, and so on dam in the alphabetical listing shall be due for inspection the second year.

(iii) The third, eighth, thirteenth, eighteenth, and so on dam in the alphabetical listing shall be due for inspection the third year.

(iv) The fourth, ninth, fourteenth, nineteenth, and so on dam in the alphabetical listing shall be due for inspection the fourth year.

(v) The fifth, tenth, fifteenth, twentieth, and so on dam in the alphabetical listing shall be due for inspection the fifth year.

(vi) The cycle shall be repeated every 5 years.

(d) Depending on its hazard potential classification, a new, reconstructed, or enlarged dam shall be scheduled for inspection 3, 4, or 5 years after the date of written notice of final project approval as required pursuant to the provisions of section 35(2) of the act or 3, 4, or 5 years after the expiration date of the permit if final approval cannot be granted. The cycle shall be repeated every 3, 4, or 5 years according to the dam's hazard potential classification.

(e) If the hazard potential classification of a dam changes, its next inspection shall be scheduled based on the date of its previous inspection and the cycle of inspections required for the new hazard potential rating.

(f) If an existing dam is discovered that falls under the authority of the act, it shall be added to the end of the appropriate alphabetical listing, and its first inspection shall be scheduled based on the system described in subdivisions (a) to (c) of this rule. If the department

determines that a condition may exist that endangers the dam, an inspection shall be required immediately.

(g) The department may alter the inspection schedule in consideration of the dates of recent inspections and department-permitted and approved repairs and alterations.

(h) Owners of more than 1 dam may request that the department schedule their inspection reports to be due the same year if the dams have the same hazard potential classification.

History: 1993 AACS.

R 281.1310 Inspection reports.

Rule 10. (1) Inspection reports shall include all of the information required in section 37(3) of the act.

(2) An inspection report shall include all of the following parts:

(a) A title sheet that includes all of the following information:

(i) The name of the dam.

(ii) The inventory identification number.

(iii) The county and river or stream where the dam is located.

(iv) The owner's and operator's names, addresses, and telephone numbers.

(v) The hazard potential classification.

(vi) The names of inspectors.

(vii) The date of inspection.

(viii) The name, address, registration number, and signature of the licensed professional engineer who is in charge of the inspection report.

(b) A conclusions and recommendations section that includes all of the following information:

(i) An evaluation of the dam's overall condition and a summary of the findings of the field inspection and analyses contained in the report.

(ii) Identification of any deficiencies that, if left uncorrected, could lead to the failure of the dam.

(iii) Prioritization of recommendations to correct observed deficiencies or operation and maintenance items for the dam.

(iv) Recommendations for further detailed studies or investigations, including an assessment of the adequacy of the current hazard potential classification if appropriate.

(c) A project information section that includes all of the following information:

(i) A description of the dam, outlet, spillway, and other principal features, together with pertinent data.

(ii) The purpose of the dam.

(iii) A summary of available design, geotechnical, maintenance, construction, repair, and alteration information and operating history.

(iv) A reference to past inspection reports.

(v) The date of construction, if known.

(d) A field inspection section that briefly describes the physical condition of the principal features of the dam and appurtenant structures, including the impoundment level, as they were observed during the field inspection.

(e) A structural stability section that includes a visual assessment of the stability of the dam on the basis of available data, together with the observations of the field inspection and the results of any calculations performed.

(f) A hydrologic and hydraulic section that includes an evaluation of spillway adequacy, including a description of pertinent available information, such as any of the following:

(i) Hydrologic design data provided by the department.

(ii) Drainage area.

(iii) Floods of record.

(iv) Previous evaluations.

(g) An operation and maintenance section that includes all of the following:

(i) An assessment of operating equipment and procedures.

(ii) Evaluation of the current maintenance plan.

(h) Appendices that include all of the following:

(i) A map that shows the location of the dam.
(ii) Engineering plans of the dam, if available, or sketches of the dam and its principal parts, including a plan view and cross sectional views of pertinent features. If there have been changes to the dam since the submittal of previous plans or sketches, supplemental plans or sketches that depict the changes shall be submitted. If engineering plans or sketches have been submitted in a previous inspection report and if there have been no changes to the dam, it is not necessary to submit duplicate plans or sketches in subsequent reports.
(iii) Photographs of the dam, downstream channel, and deficiencies cited in the report.

History: 1993 AACS.

R 281.1311 Emergency action plans.
Rule 11. (1) An emergency action plan for a high or significant hazard potential dam shall be submitted to the county or local emergency management coordinator for review for consistency with county or local emergency operations plans and the Michigan emergency preparedness plan.
An emergency action plan for an existing dam shall be submitted to the department with documentation that the plan has been submitted to the county or local emergency management coordinator not later than the time that the first inspection report for the dam is due or at another time agreed to by the department. An emergency action plan for a newly constructed dam shall be submitted to the department with documentation that the plan has been submitted to the county or local emergency management coordinator not later than the date of expiration of the permit for construction of the dam, including any extensions of time for completion.
(2) At the time subsequent inspection reports are due, the owner shall determine if the plan is up to date. The owner shall advise the department of the findings of this review and shall submit any revisions to the department and to the county or local emergency management coordinator.
(3) The emergency action plan shall include a description of the circumstances under which it shall be activated, what actions shall be taken, and who shall be responsible to take those actions when the plan is activated.
(4) The emergency action plan shall include the name, address, and telephone number of all of the following entities:
(a) The person who is responsible for the operation of the dam.
(b) The alternate person who is responsible for the operation of the dam.
(c) The local emergency management coordinator or coordinators.
(5) The emergency action plan shall include either of the following:
(a) A listing of occupied facilities, buildings, and residences that may be threatened with flooding due to the failure of the dam.
(b) Mapping that is adequate to clearly delineate the areas of potential inundation resulting from a failure of the dam.
The degree of detail for mapping or listings shall be determined through consultations between the dam owner and the appropriate emergency services agencies that are responsible for implementing the emergency action plan.

History: 1993 AACS.

R 281.1312 Administrative monetary penalties.
Rule 12. (1) As authorized pursuant to the provisions of section 51(8) of the act, an administrative penalty of not more than $500.00 per day may be assessed to a person as set forth in the schedule in subrule (2) of this rule for any of the following reasons:
(a) Violation of any or all of the conditions of a minor project permit that is issued pursuant to the provisions of section 27 of the act.
(b) Failure to submit an inspection report as required pursuant to the provisions of section 37 of the act.
(c) Failure to provide a more detailed investigation or evaluation of

certain dam features as required by section 37(5) of the act.

(d) Failure to comply with a first department order to limit dam operations as authorized pursuant to the provisions of section 39(1) of the act where significant impairment of resources has not resulted.

(e) Failure to notify the department and affected off-site public authorities and safety agencies, pursuant to the provisions of section 41(1) of the act, of any flood or unusual circumstance or occurrence, within 24 hours of the circumstance or occurrence, that endangers the safety of a dam, but where significant damage to property or natural resources does not occur.

(f) Failure to notify the department of actions taken in response to emergency conditions pursuant to the provisions of section 41(2) of the act.

(g) Failure to comply with the provisions of an emergency order that relates to any of the following as authorized pursuant to the provisions of section 43(2) of the act:

(i) Maximum drawdown levels and discharge rates.

(ii) Conducting required sediment surveys, water quality sampling, or monitoring.

(iii) Any other requirement where significant impairment of resources has not resulted.

(h) Failure to prepare, keep current, and submit to the department an emergency action plan as required pursuant to the provisions of section 47 of the act.

(i) Failure to comply with a first order to comply with permit conditions or to restore the site affected to its original condition pursuant to the provisions of section 49(1) of the act.

(j) Violation of any of the following permit conditions:

(i) Failure to supply data or information.

(ii) Failure to provide required minimum flow releases where significant impairment of resources has not resulted.

(iii) Violation of any permit condition where significant impairment of resources has not occurred.

Each violation and act of noncompliance and each day such a violation or act occurs or continues to occur will be considered a separate violation.

(2) The following administrative penalty schedule shall apply for noncompliance or violations as set forth in subrule (1) of this rule:

(a) First through the fifth day the violation occurs - not more than $100.00 per day.

(b) Sixth through the tenth day the violation occurs - not more than $200.00 per day.

(c) Eleventh through the fifteenth day the violation occurs - not more than $300.00 per day.

(d) Sixteenth through the twentieth day the violation occurs - not more than $400.00 per day.

(e) Twenty-first day until the violation is resolved - not more than $500.00 per day.

(3) All administrative penalties will be assessed by written notice from the department. The notice shall state the specific reasons for the penalty, the number of days the department considers the person in violation, and the total amount due based on the schedule in subrule (2) of this rule.

(4) If so requested, the department shall provide a person, subject to the administrative penalty provisions of section 51(8) of the act, an opportunity for a hearing pursuant to the provisions of Act No. 306 of the Public Acts of 1969, as amended, being S24.201 et seq. of the Michigan Compiled Laws.

(5) Notice of intent to assess administrative penalties pursuant to section 51(8) of the act shall be given either through written notice by certified mail or personal service on the person by the director, his or her designated representative, or a peace officer.

(6) Penalties that are administered pursuant to the provisions of section 51(8) of the act may be in addition to any other penalties or remedies authorized by the act or its rules.

History: 1993 AACS.

R 281.1313 Dams exempt from rules.

Rule 13. A dam is exempt from these rules if it is exempt from the act pursuant to the provisions of section 13(2) and (3) of the act.

NATURAL RESOURCES AND ENVIRONMENTAL PROTECTION ACT (EXCERPT)
Act 451 of 1994

PART 315
DAM SAFETY

324.31501 Meanings of words and phrases.

Sec. 31501. For purposes of this part, the words and phrases defined in sections 31502 to 31505 have the meanings ascribed to them in those sections.

History: Add. 1995, Act 59, Imd. Eff. May 24, 1995.

Popular name: Act 451

Popular name: NREPA

324.31502 Definitions; A to D.

Sec. 31502. (1) "Abandonment" means an affirmative act on the part of an owner to discontinue maintenance or operation of a dam.

(2) "Administrative procedures act of 1969" means Act No. 306 of the Public Acts of 1969, being sections 24.201 to 24.328 of the Michigan Compiled Laws.

(3) "Alteration" means a change in the design of an existing dam that directly affects or may directly affect the structural integrity of a dam.

(4) "Appurtenant works" means the structure or machinery incident to or annexed to a dam that is built to operate and maintain a dam, including spillways, either in a dam or separate from the dam; low level outlet works; and water conduits such as tunnels, pipelines, or penstocks, located either through the dam or through the abutments of the dam.

(5) "Auxiliary spillway" means a secondary spillway which is operational at all times and does not require stoplog removal or gate manipulation.

(6) "Dam" means an artificial barrier, including dikes, embankments, and appurtenant works, that impounds, diverts, or is designed to impound or divert water or a combination of water and any other liquid or material in the water; that is or will be when complete 6 feet or more in height; and that has or will have an impounding capacity at design flood elevation of 5 surface acres or more. Dam does not include a storage or processing tank or standpipe constructed of steel or concrete, a roadway embankment not designed to impound water, or a dug pond where there is no impoundment of water or waste materials containing water at levels above adjacent natural grade levels.

(7) "Days" means calendar days, including Sundays and holidays.

(8) "Design flood" means the design flow rate for spillway capacity and dam height design.

(9) "Design flood elevation" means the maximum flood elevation that is considered in the design of the spillway capacity and freeboard for a dam.

(10) "Downstream toe elevation" means the elevation of the lowest point of intersection between the downstream slope of an earthen embankment and the natural ground.

History: Add. 1995, Act 59, Imd. Eff. May 24, 1995.

Popular name: Act 451

Popular name: NREPA

324.31503 Definitions; E to H.

Sec. 31503. (1) "Emergency action plan" means a plan developed by the owner that establishes procedures for notification of the department, public off-site authorities, and other agencies of the emergency actions to be taken prior to and following an impending or actual failure of a dam.

(2) "Enlargement" means any change in or addition to an existing dam which raises or may raise the design flood elevation of the water impounded by the dam.

(3) "Failed dam" means a dam not capable of impounding water at its intended level due to a structural deficiency.

(4) "Failure" means an incident resulting in an unplanned or uncontrolled release of water from a dam.

(5) "Flood of record" means the greatest flow rate determined by the department to have occurred at a particular location.

(6) "Freeboard" means the vertical distance between the design flood elevation and the lowest point of the top of the dam.

(7) "Half probable maximum flood" means the largest flood that may reasonably occur over a watershed, and is derived from the combination of hydrologic runoff parameters and the half probable maximum storm

© Legislative Council, State of Michigan Courtesy of www.legislature.mi.gov

that produces the maximum runoff.

(8) "Half probable maximum storm" means the spatial and temporal distribution of the probable maximum precipitation, divided by 2, that produces the maximum volume of precipitation over a watershed.

(9) "Hazard potential classification" means a reference to the potential for loss of life, property damage, and environmental damage in the area downstream of a dam in the event of failure of the dam or appurtenant works.

(10) "Height" means the difference in elevation measured vertically between the natural bed of a stream or watercourse at the downstream toe of the dam, or, if it is not across a stream channel or watercourse, from the lowest elevation of the downstream toe of the dam, to the design flood elevation or to the lowest point of the top of the dam, whichever is less.

(11) "High hazard potential dam" means a dam located in an area where a failure may cause serious damage to inhabited homes, agricultural buildings, campgrounds, recreational facilities, industrial or commercial buildings, public utilities, main highways, or class I carrier railroads, or where environmental degradation would be significant, or where danger to individuals exists with the potential for loss of life.

History: Add. 1995, Act 59, Imd. Eff. May 24, 1995.

Popular name: Act 451

Popular name: NREPA

324.31504 Definitions; I to P.

Sec. 31504. (1) "Impoundment" means the water held back by a dam.

(2) "Low hazard potential dam" means a dam located in an area where failure may cause damage limited to agriculture, uninhabited buildings, structures, or township or county roads, where environmental degradation would be minimal, and where danger to individuals is slight or nonexistent.

(3) "Maintenance" means the upkeep of a dam and its appurtenant works but does not include alterations or repairs.

(4) "One-hundred year flood" means a flood that has a 1% chance of being equaled or exceeded in any given year.

(5) "Owner" means a person who owns, leases, controls, operates, maintains, manages, or proposes to construct a dam.

(6) "Probable maximum precipitation" means the theoretically greatest depth of precipitation for a given duration that is physically possible over a given size storm area at a particular geographic location at a certain time of year.

History: Add. 1995, Act 59, Imd. Eff. May 24, 1995.

Popular name: Act 451

Popular name: NREPA

324.31505 Definitions; R to T.

Sec. 31505. (1) "Removal" means the physical elimination of a dam or impoundment.

(2) "Repair" means to substantially restore a dam to its original condition and includes only such restoration as may directly affect the structural integrity of the dam.

(3) "Riparian owner" means a person who has riparian rights.

(4) "Riparian rights" means rights which accrue by operation of law to a landowner on the banks of an inland lake or stream.

(5) "Significant hazard potential dam" means a dam located in an area where its failure may cause damage limited to isolated inhabited homes, agricultural buildings, structures, secondary highways, short line railroads, or public utilities, where environmental degradation may be significant, or where danger to individuals exists.

(6) "Spillway" means a waterway in or about a dam designed for the discharge of water.

(7) "Spillway capacity" means the maximum rate of discharge that will pass through a spillway at design flood elevation.

(8) "Two-hundred year flood" means a flood that has a 0.5% chance of being equaled or exceeded in any given year.

History: Add. 1995, Act 59, Imd. Eff. May 24, 1995.

Popular name: Act 451

Popular name: NREPA

324.31506 Jurisdiction of dams and impoundments; exemptions.

Sec. 31506. (1) Except as otherwise provided in subsections (2) and (3), dams and impoundments in the

© Legislative Council, State of Michigan Courtesy of www.legislature.mi.gov

state are under the jurisdiction of the department.

(2) The following are exempt from this part:

(a) Projects licensed, projects that have preliminary permits, or projects for which an application for licensure has been filed under the federal power act, chapter 285, 41 Stat. 1063, 16 U.S.C. 791a to 793, 796 to 797, 798 to 818, 820 to 824a, and 824b to 825r, if federal dam safety inspection provisions apply during the license period and the inspection reports are provided to the department.

(b) Projects located on boundary waters under the jurisdiction and supervision of the United States army corps of engineers.

(c) Impoundments licensed pursuant to part 115 that contain or are designed to contain type III wastes as defined in rules promulgated under that part.

(3) Until January 1, 1998, a permit shall not be required under this part for the repair, reconstruction, or improvement of a dam, a portion of which is at least 75 years old, was damaged or destroyed by an act of God and is located in a county that has a per capita income of less than $8,500.00. However, a person who is performing a project for the repair, reconstruction, or improvement of a dam that is exempt from obtaining a permit under this subsection shall submit to the department and the joint capital outlay committee plans and specifications for the project. These plans and specifications shall be prepared by a licensed professional engineer and shall meet acceptable standards in the industry in order for a dam to be repaired, reconstructed, or improved. In reviewing plans and specifications for the project, the joint capital outlay committee may recommend environmental considerations to protect water quality such as underspill devices, minimum flow releases and removal of contaminated sediments that may be resuspended in the water column upon impoundment. Such contaminated sediments shall be disposed of in accordance with state law.

324.31507 Prohibited conduct; exception.

Sec. 31507. (1) A person shall not construct, enlarge, repair, reconstruct, alter, remove, or abandon any dam except in a manner provided for in this part.

(2) This section does not apply to maintenance performed on a dam that does not affect the structural integrity of the dam.

History: Add. 1995, Act 59, Imd. Eff. May 24, 1995.

Popular name: Act 451

Popular name: NREPA

324.31508 Preparation of plans and specifications; licensed professional engineer required; exceptions.

Sec. 31508. (1) Except as otherwise provided in subsection (2), a licensed professional engineer shall prepare all plans and specifications, except for minor projects undertaken pursuant to section 31513.

(2) A person who is not a licensed professional engineer may prepare plans and specifications only for repairs or alterations to a dam where the application is made by a nonprofit organization under the following circumstances:

(a) The nonprofit organization has assets of less than $30,000.00, is exempt from taxation under section 501(c)(3) of the internal revenue code of 1986, 26 U.S.C. 501, and is not composed primarily of the owners of property adjacent to or contiguous to an impoundment.

(b) The proposed repairs or alterations have a projected total cost of less than $25,000.00.

(c) The impoundment is open to the public and a notice of public access is posted.

324.31509 Activities requiring permit; application for permit; fees; waiver and disposition of fees.

Sec. 31509. (1) Except as otherwise provided in this part or as authorized by a permit issued by the department pursuant to part 13, a person shall not undertake any of the following activities:

(a) Construction of a new dam.

(b) Enlargement of a dam or an impoundment.

(c) Repair of a dam.

© Legislative Council, State of Michigan Courtesy of www.legislature.mi.gov

(d) Alteration of a dam.
(e) Removal of a dam.
(f) Abandonment of a dam.
(g) Reconstruction of a failed dam.

(2) An application for a permit shall include information that the department determines is necessary for the administration of this part. If a project includes activities at multiple locations, 1 application may be filed for the combined activities.

(3) An application for a permit for construction of a new dam, reconstruction of a failed dam, or enlargement of a dam shall be accompanied by the following fees:

(a) For a dam with a height of 6 feet or more but less than 10 feet, $500.00.
(b) For a dam with a height of 10 feet or more but less than 20 feet, $1,000.00.
(c) For a dam with a height of 20 feet or more, $3,000.00.

(4) An application for a permit for the repair, alteration, removal, or abandonment of a dam shall be accompanied by a fee of $200.00, and an application for a permit for a minor project pursuant to section 31513(1) shall be accompanied by a fee of $100.00.

(5) The department shall waive the fees under this section for applications from state agencies, department sponsored projects located on public lands, and organizations of the type described in section 31508(2)(a) through (c).

(6) The department shall forward fees collected under this section to the state treasurer for deposit in the land and water management permit fee fund created in section 30113.

324.31510 Request for notification of pending applications for permits; annual fee; biweekly list of applications; copies; contents.

Sec. 31510. (1) A person who wants to be notified of pending applications for permits issued under this part may make a written request to the department, accompanied by an annual fee of $25.00. The fee shall be deposited in the state treasury and credited to the general fund.

(2) The department shall prepare a biweekly list of the applications made during the previous biweekly period and shall promptly mail copies of the list for the remainder of the calendar year to the persons who have requested notice and paid the fee under this section.

(3) The biweekly list shall state the name and address of each applicant, the legal description of the lands included in the applicant's project, and a summary statement of the purpose of the project.

324.31511 Copies of application and statement; submission; public hearing; notice.

Sec. 31511. (1) Upon receipt of an application for a permit under this part, the department shall submit copies of the application accompanied by a statement indicating that the department may act upon the application without a public hearing unless a written request is filed with the department within 20 days after the submission for review. The department shall submit copies of the application to all of the following:

(a) The local unit of government where the project is to be located.
(b) The adjacent riparian owners.
(c) Any person considered appropriate by the department.
(d) Any person who requests copies.
(e) A watershed council, organized pursuant to part 311, of the watershed within which the project is located or is to be located.

(2) The department may hold a public hearing upon the written request of any of the following:

(a) An applicant.
(b) A riparian owner.
(c) A person or local unit of government that is entitled to receive a copy of the application pursuant to subsection (1).

(3) A public hearing held pursuant to this section shall be held in compliance with the open meetings act, Act No. 267 of the Public Acts of 1976, being sections 15.261 to 15.275 of the Michigan Compiled Laws. Public notice of the time, date, and place of the hearing shall be given in the manner provided by that act.

© Legislative Council, State of Michigan Courtesy of www.legislature.mi.gov

Additionally, the department shall mail copies of the public notice to the persons who have requested the biweekly list pursuant to section 31510, the person requesting the hearing, and the persons and local units of government that are entitled to receive a copy of the application pursuant to subsection (1).

324.31512 Necessity for immediate action; emergency conditions; application for permit to reconstruct failed dam.

Sec. 31512. (1) When immediate action is necessary to protect the structural integrity of a dam, the department may issue a permit before the expiration of the 20-day period referred to in section 31511(1). This subsection does not prohibit an owner from taking action necessary to mitigate emergency conditions if imminent danger of failure exists.

(2) A person applying for a permit to reconstruct a failed dam shall file a complete application not less than 1 year after the date of the failure. If such an application is filed more than 1 year after the date of the failure, the department shall consider the application to be an application to construct a new dam.

History: Add. 1995, Act 59, Imd. Eff. May 24, 1995;—Am. 2004, Act 325, Imd. Eff. Sept. 10, 2004.

Popular name: Act 451

324.31513 Minor project categories; rules.

Sec. 31513. (1) The department shall promulgate rules to establish minor project categories for alterations and repairs that have minimal effect on the structural integrity of a dam. The department may act upon an application and grant a permit for an activity or project within a minor project category, after an on-site inspection of the dam, without providing public notice.

(2) All other provisions of this part shall be applicable to minor projects, except that a final inspection by the department or certification of the project by a licensed professional engineer shall not be required for a project completed under a permit granted pursuant to subsection (1).

History: Add. 1995, Act 59, Imd. Eff. May 24, 1995.

Popular name: Act 451

324.31514 Effect of proposed activity on public health, safety, welfare, property, or natural resources.

Sec. 31514. The department shall not issue a permit to construct a new dam, reconstruct a failed dam for which a complete application to reconstruct has been submitted more than 1 year after the date of the failure, or enlarge the surface area of an impoundment by more than 10% unless it determines, after a review of the application submitted, that the proposed activity for which a permit is requested will not have a significant adverse effect on public health, safety, welfare, property, or natural resources or the public trust in those natural resources.

History: Add. 1995, Act 59, Imd. Eff. May 24, 1995.

Popular name: Act 451

Popular name: NREPA

324.31515 Approval of plans and specifications; completion of permitted activity; time; extension; approval of changes; duration and renewal of permit; terms and conditions; mitigating measures; recommendations; performance bond; suspension, revocation, annulment, withdrawal, recall, cancellation, or amendment of permit; hearings.

Sec. 31515. (1) Except as otherwise provided in this section, a permit issued by the department under this part shall require that plans and specifications be approved by the department before construction begins. The department shall approve or reject complete plans and specifications within 60 days after their receipt. The permitted activity shall be completed within a specified time not to exceed 2 years after the date of issuance of the permit. Upon the written application of the permittee, and for good cause shown, the department may extend the time for completing construction. The permittee shall notify the department at least 10 days before beginning construction and shall otherwise notify the department as the department may require.

(2) A change in approved plans and specifications shall not be implemented unless the department gives its prior approval. The department shall approve or reject changes in plans and specifications within 30 days after

© Legislative Council, State of Michigan Courtesy of www.legislature.mi.gov

the request for the changes.

(3) A permit is effective for the length of time specified in the permit unless it is revoked pursuant to this part. The department may renew a permit.

(4) A permit to alter, repair, or construct a new dam, reconstruct a failed dam, or enlarge the surface area of an impoundment by more than 10% may specify the terms and conditions including, but not limited to, requirements for minimum flows, cold water release, impoundment fluctuations, portage, contingency plans, and conditions under which the work is to be performed. The terms and conditions of a permit shall be effective for the life of the project. The department may consider, in issuing a permit, any mitigating measures in conjunction with the permitted activities and may make recommendations as to fish passage that may be required by part 483.

(5) A permit to construct a new dam or reconstruct a failed dam may require a performance bond to assure completion of the project or to provide for complete or partial restoration of the project site, as determined by the department in rules promulgated by the department.

(6) A permit may be suspended, revoked, annulled, withdrawn, recalled, canceled, or amended after a hearing for a violation of any of its provisions, a violation of this part, a violation of a rule promulgated under this part, or any misrepresentation contained in the application. Hearings shall be conducted by the department in accordance with the provisions for contested cases in the administrative procedures act of 1969.

324.31516 Spillway capacity; minimum criteria; freeboard; auxiliary spillway; duty of owner.

Sec. 31516. (1) Spillway capacity shall meet the following minimum criteria:

(a) Low hazard potential dams shall be capable of passing the 100-year flood, or the flood of record, whichever is greater.

(b) Significant hazard potential dams shall be capable of passing the 200-year flood, or the flood of record, whichever is greater.

(c) High hazard potential dams, less than 40 feet in height, as measured from the 200-year design flood elevation to the lowest downstream toe elevation, shall be capable of passing the 200-year flood, or the flood of record, whichever is greater.

(d) High hazard potential dams, 40 feet or greater in height, as measured from the 200-year design flood elevation to the lowest downstream toe elevation, shall be capable of passing the half probable maximum flood. The half probable maximum flood criterion may be reduced to not less than the 200-year flood, with proper documentation evidencing a failure of a dam under half probable maximum flood conditions will not cause additional flood damage or loss of life.

(e) Spillway design capacity shall not be less than the flood of record.

(2) Freeboard shall be considered when determining spillway capacity.

(3) If a dam cannot pass the design flood, an auxiliary spillway must be provided. The owner must document, to the satisfaction of the department, that the dam has sufficient spillway capacity, and that proper means are available to operate the spillway or spillways during the design flood.

324.31517 Duties of owner; inspection; notice of final approval; notice of project not completed in accordance with plans, specifications, or conditions; enforcement action.

Sec. 31517. (1) Except for minor projects authorized pursuant to section 31513, the owner shall do both of the following:

(a) Within 10 days after the completion of a new, reconstructed, enlarged, repaired, or altered dam, notify the department of its completion.

(b) Within 20 days after submitting the notice of completion, file with the department as-built plans and a statement signed by a licensed professional engineer certifying that the project was constructed in conformance with plans and specifications approved by the department.

(2) The department shall inspect the project and shall provide the owner with written notice of final approval if the project is determined to have been completed in accordance with approved plans, specifications, and permit conditions.

(3) If the project is determined not to be completed in accordance with plans and specifications approved by the department and permit conditions, the department shall provide notice to the permittee as to the

© Legislative Council, State of Michigan Courtesy of www.legislature.mi.gov

specific reasons the department determines the project not to be completed in accordance with those plans, specifications, or conditions. The department may then take enforcement action as provided in this part.

324.31518 Inspection reports; determination of hazard potential classification; inspection schedule; notice; additional inspection reports; contents of inspection report; visual inspection and report; detailed investigation or evaluation; life or property threatened by breach of dam; cause of action; ordering actions to alleviate danger.

Sec. 31518. (1) An owner shall submit to the department inspection reports prepared by a licensed professional engineer that evaluate the condition of the dam. The inspection report shall be submitted as follows:

(a) Not less than once every 3 years for high hazard potential dams.

(b) Not less than once every 4 years for significant hazard potential dams.

(c) Not less than once every 5 years for low hazard potential dams.

(2) The department shall determine the hazard potential classification of all dams and shall establish an inspection schedule. The inspection schedule shall require annual submission of inspection reports for approximately 1/3 of all high hazard potential dams, 1/4 of all significant hazard potential dams, and 1/5 of all low hazard potential dams. The department shall notify owners in writing when inspection reports are due. The department may order additional inspection reports following an event or change in condition that could threaten a dam.

(3) An inspection report required by this section shall include, at a minimum, all of the following:

(a) An evaluation of the dam's condition, spillway capacity, operational adequacy, and structural integrity.

(b) A determination of whether deficiencies exist that could lead to the failure of the dam.

(c) Recommendations for maintenance, repair, and alterations of a dam as are necessary to eliminate any deficiencies.

(4) Instead of engaging a licensed professional engineer to prepare an inspection report, local units of government or an organization of the type described in section 31508(2)(a) through (c) may request the department to conduct a visual inspection of a dam owned by that local unit of government and prepare a report on the condition of the dam in accordance with subsection (3). The department shall notify a requesting local unit of government as to when the inspection is to occur.

(5) If an inspection report discloses the need for a more detailed investigation or evaluation of certain dam features for the purpose of determining the condition of the dam, the department may order the completion and submission of that detailed investigation or evaluation at the expense of the owner. An investigation or evaluation required under this subsection shall be conducted under the supervision of a licensed professional engineer.

(6) If an owner does not submit an inspection report as required by subsection (1) or conduct additional investigations if required by subsection (5), the department or any person who would have life or property threatened by a breach of the dam may have a report prepared and recover the costs of preparing the report in a civil action commenced in a court of competent jurisdiction. This subsection does not limit the right of any person to bring a cause of action in a court of proper jurisdiction to compel an owner to comply with the requirements of this part.

(7) If, based on the findings and recommendations of the inspection report and an inspection by the department, the department finds that a condition exists which endangers a dam, it shall order the owner to take actions that the department considers necessary to alleviate the danger.

324.31519 Order to limit dam operations; order to remove dam; hearing.

Sec. 31519. (1) Where significant damage to the public health, safety, welfare, property, and natural resources or the public trust in those natural resources or damage to persons or property occurs or is anticipated to occur due to the operation of a dam, the department may order the owner to limit dam operations. These orders may include, but are not limited to, cold water release, minimum flow releases from dams, impoundment fluctuation restrictions, or requirements for run-of-the-river operation. In issuing these orders, the department shall take into account social, economic, and public trust values.

© Legislative Council, State of Michigan Courtesy of www.legislature.mi.gov

(2) Where significant damage to persons, property, or natural resources or the public trust in those natural resources occurs as a result of the condition or existence of a dam, the department may order the removal of the dam following a determination by the department that, due to the continued condition or existence of the dam, the dam is likely to continue to cause significant damage. In issuing a removal order, the department shall take into account social and economic values, the natural resources, and the public trust in those natural resources and shall not issue a removal order when those factors exceed adverse impacts on natural resources or present danger to persons or property. The department shall not issue a removal order involving a dam subject to the regulatory authority of the Michigan public service commission or the federal energy regulatory commission unless that commission has concurred in writing with the order.

(3) Prior to finalizing an order under this section, the department shall provide an owner an opportunity for a hearing pursuant to the administrative procedures act of 1969.

324.31520 Sudden or unprecedented flood; unusual or alarming circumstance or occurrence; emergency drawdowns, repairs, breaching, or other action; notice.

Sec. 31520. (1) The owner or his or her agent shall advise the department and the affected off-site public authorities and safety agencies of any sudden or unprecedented flood or unusual or alarming circumstance or occurrence existing or anticipated that may affect the safety of the dam within 24 hours of the flood, circumstance, or occurrence.

(2) The owner shall notify the department as soon as possible of any necessary emergency drawdowns, repairs, breaching, or other action being taken in response to an emergency condition.

History: Add. 1995, Act 59, Imd. Eff. May 24, 1995.

Popular name: Act 451

324.31521 Emergency orders.

Sec. 31521. (1) The department may issue emergency orders as provided in this section. The department may, by written notice, order an owner to immediately repair, draw down, breach, or cease operation of a dam where a dam is in imminent danger of failure and is causing or threatening to cause harm to public health, safety, welfare, property, or the natural resources or the public trust in those natural resources. If an owner fails to comply with an order, or is unavailable or unable to be contacted, then the department may undertake immediate repair, drawdown, breaching, or cessation of operation, as may be necessary to alleviate the danger, and may recover from the owner the costs incurred in a civil action commenced in a court of competent jurisdiction. The department may terminate an emergency order upon a determination in writing that all necessary emergency actions have been complied with by the owner and that an emergency no longer exists.

(2) When ordering emergency actions under subsection (1), the department may specify maximum drawdown level and discharge rates and require sediment surveys, water quality sampling, monitoring, or any other action determined necessary by the department to ensure adequate protection of the public health, safety, welfare, property, or natural resources or the public trust in those natural resources. The department may modify the requirements of an emergency order if, during the conduct of ordered actions, it determines that the modification is necessary to protect the public health, safety, welfare, property, or natural resources or the public trust in those natural resources.

(3) Upon the issuance of an emergency order, the department shall provide the owner with an opportunity for a hearing pursuant to the administrative procedures act of 1969 within 15 days of the date of its issuance. At the hearing, the department shall determine, based on information and fact, if the emergency order shall be continued, modified, or suspended as necessary to protect public health, safety, welfare, property, or natural resources or the public trust in those natural resources.

324.31523 Emergency action plans; submissions; review; consistency with other plans; contents of plans.

Sec. 31523. (1) An owner shall prepare, and keep current, emergency action plans for all high and significant hazard potential dams owned by that person.

(2) Emergency action plans shall be submitted to the department.

(3) The applicable county or local emergency management coordinators shall review for consistency emergency action plans with the county or local emergency operations plan prior to submission of those plans to the department.

(4) An emergency action plan shall be consistent with the applicable provisions of the affected county or local emergency operations plans and the Michigan emergency preparedness plan as developed pursuant to the emergency preparedness act, Act No. 390 of the Public Acts of 1976, being sections 30.401 to 30.420 of the Michigan Compiled Laws.

(5) Emergency action plans shall include, but not be limited to, the name, address, and telephone number of the person, and of an alternate person, responsible for operation of the dam; the name and telephone number of local emergency management coordinators; and a listing of occupied facilities, buildings, and residences that may be threatened with flooding due to a failure of the dam.

324.31524 Violation; order; suspension, modification, or revocation of permit; remedies cumulative; civil action.

Sec. 31524. (1) If the department determines that a person is in violation of this part, a rule promulgated under this part, or a condition set forth in a permit issued under this part, the department may issue an order requiring the person to comply with the conditions or to restore the site affected by the violation as nearly as practicable to its original condition. Restoration may include, but is not limited to, removing fill material deposited or replacing soil, sand, or minerals.

(2) An order shall state the nature of the violation and the required remedial action, and shall specify a time for compliance that the department determines is reasonable, taking into account the seriousness of the violation and the nature of any threat to public health, safety, welfare, property, or natural resources, or the public trust in those natural resources, that may be involved.

(3) If the department determines that a person is in violation of this part, a rule promulgated under this part, an order issued by the department, or a permit, the department, after notice and opportunity for hearing pursuant to the administrative procedures act of 1969, may suspend, modify, or revoke a permit. The remedies under this section and section 31525 are cumulative and do not prevent the department from imposing other penalties available under this part, a rule promulgated under this part, or an order of the department.

(4) If the department determines that a person is in violation of this part, a rule promulgated under this part, an order issued by the department pursuant to this part, or a permit issued pursuant to this part, the department may bring a civil action in the circuit court.

324.31525 Commencement of civil action; request; place; civil fine; contempt; willful or reckless violation as misdemeanor; penalty; subsequent violations; fine for failure to obtain permit; restoration of site; schedule of administrative monetary penalties for minor violations.

Sec. 31525. (1) The attorney general may commence a civil action for appropriate relief, including injunctive relief, upon request of the department under section 31524.

(2) Any civil action under this section may be brought in the circuit court for the county of Ingham or for the county in which the dam is located.

(3) In addition to any other relief granted under this section, the court may impose a civil fine of not more than $10,000.00 for each day of violation of this part, a rule promulgated under this part, or a permit issued under this part.

© Legislative Council, State of Michigan Courtesy of www.legislature.mi.gov

(4) A person found guilty of contempt of court for the violation of an order of the court shall be subject to a civil fine not to exceed $10,000.00 for each day of violation.

(5) A person who willfully or recklessly violates this part, a rule promulgated under this part, an order issued by the department, or a condition in a permit issued under this part, which violation places or may place a person in imminent danger of death or serious bodily injury or may cause serious property damage or serious damage to natural resources, or a person who has knowledge of or is responsible for such a violation, is guilty of a misdemeanor, punishable by imprisonment for not more than 1 year or a fine of not less than $2,500.00 or more than $25,000.00 for each day of violation, or both. A person who violates this section a second or subsequent time is guilty of a felony, punishable by imprisonment for not more than 2 years or a fine of not less than $10,000.00 for each day of violation, or both.

(6) A person required to obtain a permit for activity regulated under this part who does not obtain that permit shall be fined not less than twice the fee charged for the appropriate permit application.

(7) In addition to the orders of compliance and penalties provided under this part, the court may order a person who violates this part, a rule promulgated under this part, or a permit issued under this part to restore the site affected by the violation as nearly as practicable to its original condition. Restoration may include, but is not limited to, removing fill material deposited or replacing soil, sand, or minerals.

(8) The department may establish, by rule, a schedule of administrative monetary penalties for minor violations of this part, a rule promulgated under this part, a permit issued pursuant to this part, or an order issued by the department pursuant to this part.

6115.1550 APPEAL.

PERMIT, INSPECTION, AND MONITORING FEES

6115.0010 STATUTORY AUTHORITY.

The commissioner of natural resources is authorized by Minnesota Statutes, sections 103G.301, subdivision 2 to 5, and 103G.315, subdivision 12, to establish fee schedules for permit applications, field inspections, and monitoring, with regard to permits required by Minnesota Statutes, chapter 103G.

Statutory Authority: *MS s 105.44; 103G.301; 103G.315*

History: *10 SR 236*

Posted: *June 11, 2008*

6115.0020 SCOPE.

The fees established in parts 6115.0010 to 6115.0100 shall not be imposed on any state or federal agency.

Statutory Authority: *MS s 105.44*

History: *10 SR 236*

Posted: *June 11, 2008*

6115.0030 DEFINITIONS.

Words used in parts 6115.0010 to 6115.0100 have the meanings normally ascribed to them except:

A. "Appropriation of water," "waters of the state," and "public waters" have the meanings given by Minnesota Statutes, section 103G.005.

B. "Field inspection" means an on-site determination of relevant characteristics of the area involved in or affected by the proposed or permitted project.

C. "Monitoring" means checking on the status or progress of activities authorized by permit, and checking and inspecting special aspects of proposed permit applications, during construction, implementation, or after completion of permitted activities.

D. "Division" means the Division of Waters, Department of Natural Resources.

E. "Commissioner" means the commissioner of natural resources or the commissioner's authorized representative.

F. "Project cost" means the total cost of all materials, services, equipment purchase or rental, and labor expended for the portion of the project proposed in the permit application which are directly governed by protected waters permit rules, parts 6115.0150 to 6115.0280.

G. "Protected waters" means those waters of the state identified as public waters or wetlands under Minnesota Statutes, sections 103G.005, subdivisions 15 and 15a, and 103G.201.

H. "Ordinary high water mark" means the boundary of protected waters as defined in Minnesota Statutes, section 103G.005, subdivision 14.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

I. "Shoreline" means:

(1) for water bodies other than watercourses, the lateral measurement along the contour of the ordinary high water mark; and

(2) for watercourses, the top of the bank of the channel (coincides with ordinary high water mark as defined in Minnesota Statutes, section 103G.005, subdivision 14).

J. "State agency" has the meaning given in Minnesota Statutes, section 16B.01, subdivision 2.

6115.0060 PERMIT FEES APPLICATIONS.

Subpart 1. **Fee.** A permit application fee of $75 shall accompany permit applications submitted under Minnesota Statutes, section 103G.271, appropriation and use of water, Minnesota Statutes, section 103G.531, subdivision 2, relating to dams, and Minnesota Statutes, section 105.391, relating to water bank.

Subp. 2. **Protected waters; fee.** The permit application fee for works affecting protected waters, authorized under Minnesota Statutes, sections 103G.245 and 103G.297, shall be based on estimated project cost, the amount of material deposited in or removed from the protected waters, and the amount of shoreline affected by the project. The commissioner shall make the final determination of project costs used to calculate the permit application fee. The permit application fee shall be the greater of the fees calculated from the following parameter schedules, but not less than $75 nor more than $500:

A. Project cost parameter. If the project cost is greater than $7,500, the fee shall be one percent of the project cost. If a dispute arises between the commissioner and a permit applicant over project cost, the commissioner may require the permit applicant to submit a project cost estimate prepared by a registered professional engineer, contractor, planning consultant, or other qualified professional entity.

B. Shoreline affected parameter. If the project affects more than 100 feet of shoreline, the fee shall be 75 cents per foot of shoreline affected. For channel excavation projects, the shoreline affected is the difference in length in feet between the existing channel and the proposed channel.

C. Fill-excavation parameter. If the project requires more than 100 cubic yards of fill or excavation, the fee shall be 75 cents per cubic yard of material filled or excavated. For channel excavation projects, the volume in cubic yards is only that material filled or excavated in existing protected waters.

D. The permit application fee for protection of shoreline from erosion by placement of riprap and to recover shoreland lost by erosion or other natural forces, shall be limited to $75.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

Subp. 3. **Failure to remit.** If the permit application fee does not accompany the application, the applicant will be so notified. If no fee is received within 30 days from mailing of the written notice, the commissioner shall consider the application withdrawn and no further action shall be taken on it unless the applicant submits a new application accompanied by the minimum fee.

Subp. 4. **Multiple applications.** If a project requires several permit applications, the permit application fee must accompany each application. Projects that involve a combination of work that results in both the alteration of protected waters and the use of waters of the state, shall be required to submit only one permit application and one set of fees. The type of permit application to be used and the fees to be charged shall be determined by the ultimate purpose of the project.

Subp. 5. **Nonrefundable.** The permit application fee is not returnable, whether the application is permitted, modified, or denied, unless the commissioner determines the activity does not require a permit.

Subp. 6. **Applications after commencement.** The permit application fee for permit applications filed after the work applied for has been partially or wholly completed, except for emergency work provided for in existing permit rules and policies, shall be double the amount that would have been charged if a timely application had been filed. In the case of a belated permit application, the permit application fee shall accompany the application or the commissioner shall proceed to issue a restoration order under Minnesota Statutes, section 103G.315, subdivision 7.

Subp. 7. **Fees following a hearing.** If a hearing is demanded, and if the outcome of the hearing is a decision to issue a permit, payment of all required fees must precede issuance. The fee charged will be based on the schedules contained in this part regardless of whether a permit application has been filed.

Subp. 8. **Form of payment.** Payment of all fees covered by parts 6115.0010 to 6115.0030, 6115.0060, 6115.0080 to 6115.0100, and 6115.0130 shall be made by check or money order payable to the Minnesota Department of Natural Resources. Cash cannot be accepted.

6115.0065 AMENDMENT AND TRANSFER FEE.

Each request by a permittee to amend or transfer an existing permit shall be accompanied by a $75 fee, unless exempted under part 6115.0120. Any amendment initiated by the department is exempt from fees. Projects that involve a combination of transfer and amendment requests shall only be required to pay the $75 fee.

6115.0080 FIELD INSPECTION FEES.

Subpart 1. [Repealed, 13 SR 2825]

Subp. 2. **Computation.** If a field inspection is conducted, field inspection fees shall be charged only for: (1) projects requiring an environmental assessment worksheet (EAW) or environmental impact statement (EIS) pursuant to Minnesota Statutes, chapter 116D and the environmental review program rules, parts 4410.0200 to 4410.6500. Projects that do not require a mandatory environmental assessment worksheet (EAW) or environmental impact statement (EIS) under parts 4410.4300 and 4410.4400, at the time the permit application is made, shall not be charged field inspection fees; (2) projects undertaken without a permit or application as required by Minnesota Statutes, section 84.083, and chapters 103A, 103B, and 103E to 103G; or (3) projects undertaken in excess of limitations established in an issued permit.

The fee charged will be the actual cost of the field inspection, but shall not be less than $100.

Examples of field inspection costs are:

A. state salaries, including fringe benefits and overhead, (travel and inspection time of state employees multiplied by actual hourly rates);

B. transportation to and from inspection site, laboratories and other documented travel sites, based on current Department of Administration rates or rates specified in applicable bargaining unit agreements;

C. expense of purchase, rental, or repair of special equipment and supplies;

D. living expenses away from home, based on current Department of Administration rates or rates specified in applicable bargaining unit agreements;

E. inspection and consultant services contracted for by the state; and

F. laboratory expenses and analysis of data.

Subp. 2a. **Dams and water level controls.** Field inspection fees shall not be charged for any dam subject to parts 6115.0300 to 6115.0520. Such dams are subject to the inspection fee requirements of part 6115.0520. Field inspection fees for all other water level control structures shall be charged pursuant to parts 6115.0010 to 6115.0130.

Subp. 3. [Repealed by amendment, 10 SR 236]

6115.0090 FEES FOR MONITORING ACTIVITIES.

If the project requires an environmental assessment worksheet (EAW) or environmental impact statement (EIS) pursuant to Minnesota Statutes, chapter 116D, and parts 4410.0200 to 4410.6500, the commissioner shall charge an additional fee for monitoring subject to the following:

A. Where the commissioner determines that a permitted activity requires monitoring of water or related land resources, the permit shall specify the procedures and scope of such monitoring. Actual costs of the monitoring shall be paid by the permittee in accordance with procedures set forth in the permit.

B. When the commissioner determines after the permit is issued, that there is a need for monitoring, the commissioner shall notify the permittee in writing of the nature of and reasons for the monitoring, and after opportunity for hearing, shall modify the permit accordingly. The actual costs of the monitoring shall be paid by the permittee.

Actual costs incurred and charged by the state are determined in the same manner as prescribed for field inspections.

The commissioner may allow the permittee to provide the monitoring service or employ a consultant for that purpose, subject to the right of the commissioner to charge for state costs related to private monitoring, including the costs of periodically monitoring the monitor.

Fees for monitoring activities shall not be charged for any dam subject to parts 6115.0300 to 6115.0520.

6115.0110 ANNUAL WATER APPROPRIATION PROCESSING FEE.

Subpart 1. **In general.** An annual water appropriation processing fee shall be submitted for each water appropriation permit in force at any time during the year. The fees are required whether or not the permittee appropriated or used any water as authorized by permit during the year.

Subp. 2. **Fee schedule.** The fee shall be based on the following schedule:

A. for irrigation permits, $15 for the first permitted 160 acres or portion thereof, and $25 for each additional permitted 160 acres or portion thereof;

B. for all other permits, $5 for each permitted 10,000,000 gallons or portion thereof;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

C. the annual water appropriation processing fee shall not exceed a total fee of $500 per permit.

Subp. 3. **Billing and payment.** A notice of the fees owed will be mailed to the permittee, with the reporting forms, by the commissioner.

The fee, with accompanying report, for the calendar year's appropriation or use of water, shall be sent to the commissioner no later than February 15 of the following year.

Failure to pay the fee shall be sufficient cause for terminating a permit 30 days following written notice by the commissioner.

The effective date of this part is August 1, 1985.

Statutory Authority: *MS s 105.44*

History: *10 SR 236*

Posted: *June 11, 2008*

6115.0120 WATER APPROPRIATION PROCESSING FEE EXEMPTIONS.

The following water appropriation permit actions are exempt from amendment or transfer fees:

A. a change in mailing address;

B. a change of authorized agent when land ownership has not changed;

C. an assignment of a permit within the immediate family;

D. a change in pump location on surface water sources for the same operation;

E. an addition of a new well that replaces an old well for the same permitted operation and is completed at a similar depth in the same aquifer;

F. a decrease in the permitted pumping rate, amount of water authorized, or irrigated acreage;

G. an increase in the permitted pumping rate within ten percent;

H. an increase in the permitted appropriation within ten percent of the annual authorization for nonirrigation permits; or

I. an increase of less than 30 acres in the number of permitted irrigated acres.

Any amendments or transfers that exceed the exemptions in items A to I require a processing fee under part 6115.0065.

FEES FOR UNDERGROUND GAS OR LIQUID STORAGE

6115.0130 FEE SCHEDULE FOR UNDERGROUND STORAGE OF GAS OR LIQUID IN NATURAL FORMATIONS.

Subpart 1. **In general.** This schedule is established pursuant to Minnesota Statutes, section 103I.681, subdivision 11. It provides for payment of permit application fees and additional fees for processing and analyzing the application, and issuing the permit. It also includes fees for the inspection and monitoring of activities authorized by the permit.

Subp. 2. **Permit application fee.** A permit application fee of $30, check or money order, payable to the commissioner of management and budget, shall accompany each permit application for underground storage of gas or liquid.

If the fee does not accompany the application, the applicant will be so notified, and there will be no further action taken on the application until the fee is submitted.

Subp. 3. **Additional fees.** The applicant or permittee shall pay the actual costs of field inspection and monitoring as follows.

A. When a field inspection is conducted, the costs charged will be the sum of: salaries (inspection time of state employees multiplied by actual hourly rates); transportation to and from inspection site, based on current state Department of Administration rates; fair rental for any special equipment and supplies; and inspection and consultant services contracted for by the state.

B. When the commissioner determines that a permitted activity requires monitoring of water or related land resources, the permit shall specify the procedures and scope of such monitoring. Actual costs of the monitoring, whether conducted by state personnel or by consultants hired by the state, shall be paid by the permittee in accordance with procedures in the permit.

When the commissioner determines after the permit is issued that there is a need for monitoring, the commissioner shall notify the permittee in writing of the nature of and reasons for the monitoring, and after opportunity for hearing, shall modify the permit accordingly. The actual costs of monitoring shall be paid by the permittee.

The commissioner may allow the permittee to provide monitoring services, or employ a consultant for that purpose, subject to the right of the commissioner to charge for state costs related to private monitoring, including the costs of periodically monitoring the monitor.

Subp. 4. **Refund of fees.** The permit application fee for a permit application shall not be refunded for any reason, even if the application is denied or withdrawn.

Subp. 5. **Billing and payment of fees.** The commissioner shall submit an itemized bill to the applicant or permittee for all additional fees. Fees are payable within 30 days of receipt; failure to pay

STANDARDS AND CRITERIA FOR GRANTING PERMITS TO CHANGE THE COURSE, CURRENT, OR CROSS-SECTION OF PUBLIC WATERS

6115.0150 PURPOSE AND STATUTORY AUTHORITY.

The purpose of parts 6115.0150 to 6115.0280 is to provide for the orderly and consistent review of permit applications in order to conserve and utilize the water resources of the state in the best interest of its people. In deciding whether to issue permits, the department is guided by the policies and requirements declared in Minnesota Statutes, sections 103A.201, 103A.208, 103F.101, 103F.105, 103F.205, 103F.351, 103G.297, 103G.305, and 116D.04.

The proposed development must also be consistent with the goals and objectives of applicable federal, state, and local environmental quality programs and policies, including but not limited to shoreland management, floodplain management, water surface use management, boat and water safety, wild and scenic rivers management, water quality management, recreational or wilderness management, critical areas management, scientific and natural areas management, and protected species management.

Statutory Authority: *MS s 103G.315; 105.415*

History: *8 SR 533; 25 SR 143; 27 SR 529*

Posted: *June 11, 2008*

6115.0160 SCOPE.

To achieve the purpose declared in part 6115.0150, parts 6115.0160 to 6115.0280 set forth minimum standards and criteria for the review, issuance, and denial of permits for proposed projects affecting public waters. Permits are required for any activity affecting the course, current, or cross-section of public waters unless specifically exempted within parts 6115.0160 to 6115.0280.

These standards and criteria apply to the public waterbasins, public watercourses, and public water wetlands identified on public water inventory maps authorized by Minnesota Statutes, section 103G.201. The designation of waters of the state as public waters does not grant the public additional rights or grant right of access to the waters, diminish the right of ownership or usage of the beds underlying the designated public waters, affect state law forbidding trespass on private lands, or require the commissioner to acquire access to the designated public waters under Minnesota Statutes, section 97A.141.

These standards and criteria apply to any and all work that will cause or result in the alteration of the course, current, or cross-section of public waters except for the following:

A. utility crossings of public waters that are regulated under Minnesota Statutes, section 84.415, and rules adopted thereunder;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

B. planting, destruction, and control of aquatic vegetation that is regulated under Minnesota Statutes, section 103G.615, and rules adopted thereunder;

C. water aeration systems that are regulated under Minnesota Statutes, section 103G.611, and rules adopted thereunder;

D. watercraft, buoys, or other structures that are regulated under Minnesota Statutes, section 86B.111, 86B.211, or 86B.401, and rules adopted thereunder; or

E. water appropriations that are regulated under Minnesota Statutes, section 103G.271, and rules adopted thereunder.

6115.0170 DEFINITIONS.

Subpart 1. **Certain terms.** For the purposes of parts 6115.0150 to 6115.0280, certain terms or words used are interpreted as follows: the word "shall" is mandatory, not permissive. All distances unless otherwise specified are measured horizontally.

Subp. 2. **Alteration.** "Alteration" means any activity that will change or diminish the course, current, or cross-section of public waters.

Subp. 3. **Beds of public waters.** "Beds of public waters" means all portions of public waters located below the ordinary high water level.

Subp. 3a. **Boat storage structure.** "Boat storage structure" means a structure that is supported on the bed of a public water and has walls, a roof, and either an open well for boats or a floor from wall to wall.

Subp. 3b. **Boathouse.** "Boathouse" means a floating structure that is moored by spuds, cables, ropes, anchors, or chains; may be intended for habitation; and has walls, a roof, and either an open well for boats or a floor from wall to wall. Boathouse does not include a houseboat or boat storage structure.

Subp. 4. **Breakwater.** "Breakwater" means an offshore structure intended to protect a shore area, harbor, or marina from wave and current action, erosion, or sedimentation.

Subp. 5. **Commissioner.** "Commissioner" means the commissioner of natural resources.

Subp. 6. **Department.** "Department" means the Department of Natural Resources.

Subp. 7. **Dock.** "Dock" means a narrow platform or structure extending waterward from the shoreline intended for ingress and egress for moored watercraft or seaplanes or to provide access to deeper water for swimming, fishing, or other water-oriented recreational activities.

Subp. 8. **Drainage.** "Drainage" means any method for removing or diverting waters from public waterbasins or public water wetlands. The methods include, but are not limited to, excavation of an open ditch, installation of subsurface drainage tile, filling, diking, or pumping.

Subp. 9. **Drawdown.** "Drawdown" means a temporary lowering of water levels, for a maximum duration of two years.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

Subp. 9a. **Ecology of the waters.** "Ecology of the waters" means the natural aquatic environment, including organisms, physical characteristics, and interactions between and among the organisms and their surroundings.

Subp. 9b. **Energy exchanger.** "Energy exchanger" means a structure designed for placement on the bed or excavated into the bed of public waters for the purpose of exchanging energy for heating or cooling and includes accompanying hoses or lines connecting the energy exchange components.

Subp. 10. **Excavation.** "Excavation" means the displacement or removal of the sediment or other materials from the beds of public waters by means of hydraulic suction or mechanical operations.

Subp. 11. **Fill.** "Fill" means any material placed or intended to be placed on the bed or bank of any public water.

Subp. 12. **Filter.** "Filter" means a transitional layer of gravel, small stone, or fabric between the fine material of an embankment and riprap shore protection materials.

Subp. 13. **Floating structure.** "Floating structure" means any structure, except for boathouses, watercraft, and seaplanes, that is supported entirely by its own buoyancy and can be removed from public waters before winter freeze-up by skidding intact or by disassembly with hand tools.

Subp. 14. **Floodplain.** "Floodplain" means the areas adjoining a watercourse which has been or hereafter may be covered by the regional flood.

Subp. 15. **Floodway.** "Floodway" means the channel of the watercourse and those portions of the adjoining floodplains which are reasonably required to carry and discharge the regional flood.

Subp. 16. **Harbor.** "Harbor" means either an inland or offshore area protected from waves which is intended for the mooring of watercraft.

Subp. 16a. **Houseboat.** "Houseboat" means a motorboat that has either a pontoon or a flat-bottomed hull configuration and a permanent enclosed superstructure that houses, at a minimum, built-in sleeping, cooking, and toilet facilities.

Subp. 16b. **Ice ridge.** "Ice ridge" means a linear mound of lakebed materials pushed up onto the lakeshore by the action of ice.

Subp. 17. **Inland boat slip.** "Inland boat slip" means an inland excavation generally having a uniform width which serves as a protective area for launching and mooring of a single watercraft.

Subp. 18. **Inland excavation.** "Inland excavation" means any excavation intended to extend the cross-section of public waters landward of the natural or preexisting shoreline.

Subp. 18a. **Local government unit.** "Local government unit" has the meaning given in part 8420.0111, subpart 38.

Subp. 18b. **Local origin.** "Local origin" means a source for live plant materials and their propagules that is limited to areas of the same region where the plant materials are proposed to be planted, not to exceed 200 miles from where the plant materials are proposed to be planted.

Subp. 19. **Low-water ford type crossing.** "Low-water ford type crossing" means a stream crossing which conforms to the natural cross-section of the stream and utilizes the placement of a suitable substrate to allow vehicular passage without confining the stream flow within culverts or other hydraulic enclosures.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

Subp. 20. **Marina.** "Marina" means either an inland or offshore commercial mooring facility for the concentrated mooring of seven or more watercraft or seaplanes wherein commercial ancillary services common to marinas are provided.

Subp. 21. **Maximum.** "Maximum," with respect to storage capacity, refers to the most severe design condition, including surcharge (floodwater storage).

Subp. 22. **Mining activity.** "Mining activity" means the construction, reconstruction, repair, relocation, expansion, or removal of any facility for the extraction, stockpiling, storage, disposal, or reclamation of metallic or nonmetallic minerals. Facilities include all mine pits, quarries, stockpiles, tailings basins, and any structures which drain or divert public waters to allow mining. Ancillary facilities such as access roads, bridges, culverts, and water level control structures are not mining activities.

Subp. 23. **Mooring.** "Mooring" means any containment of free-floating watercraft that provides a fixed fastening for the craft.

Subp. 23a. **Mooring facility.** "Mooring facility" means a concentrated area intended solely for the mooring or containment of seven or more watercraft or seaplanes by docks, mooring buoys, or other means.

Subp. 23b. **Native plants.** "Native plants" means indigenous plant species growing in an ecological classification system province or a major watershed in Minnesota prior to European settlement.

Subp. 24. **Offshore.** "Offshore" means the area waterward of the ordinary high water level of a public water.

Subp. 25. **Ordinary high water level.** "Ordinary high water level" means the boundary of public waters as defined in Minnesota Statutes, section 103G.005, subdivision 14.

Subp. 26. [Repealed, 27 SR 529]

Subp. 26a. **Permit.** "Permit" means a public waters work permit required under Minnesota Statutes, section 103G.245.

Subp. 27. **Port.** "Port" means a water transportation complex established and operated under the jurisdiction of a port authority pursuant to Minnesota Statutes, chapter 458.

Subp. 28. **Port facility.** "Port facility" means any facility useful in the maintenance and operation of a port. Facilities include, but are not limited to, transportation facilities, terminal and storage facilities, floating and handling equipment, power stations, and other facilities necessary for the maintenance and operation of a port.

Subp. 29. **Principal spillway.** "Principal spillway" means a spillway designed to convey water from an impoundment at release rates established for the structure.

Subp. 30. **Professional engineer.** "Professional engineer" means an engineer registered to practice in Minnesota.

Subp. 30a. **Project.** "Project" means a specific plan, contiguous activity, proposal, or design necessary to accomplish a goal. As used in parts 6115.0150 to 6115.0280, a project may not be split into components or phases for the sole purpose of gaining an exemption from permit requirements.

Subp. 31. **Public water or public waters.** "Public water" or "public waters" means those waters of the state identified under Minnesota Statutes, section 103G.005, subdivision 15 or 15a, or 103G.201.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

Subp. 31a. **Public water wetlands.** "Public water wetlands" means those public waters of the state identified as public water wetlands under Minnesota Statutes, section 103G.005, subdivision 15a, or 103G.201, as shown on the public water inventory maps.

Subp. 31b. **Public waterbasins.** "Public waterbasins" means those public waters of the state identified as public waterbasins under Minnesota Statutes, section 103G.005, subdivision 15, clauses (1) to (8), or 103G.201, as shown on the public water inventory maps. Public waterbasins includes public water wetlands reclassified as public waters according to the procedures in Minnesota Statutes, section 103G.201.

Subp. 31c. **Public watercourse.** "Public watercourse" means those public waters of the state identified as natural and altered natural watercourses under Minnesota Statutes, section 103G.005, subdivision 15, clauses (9) and (10), or 103G.201, as shown on the public water inventory maps.

Subp. 31d. **Public waters inventory or protected waters inventory.** "Public waters inventory" or "protected waters inventory" means the map prepared by the commissioner on file with the auditor of a county under Minnesota Statutes, section 103G.201.

Subp. 31e. **Public waters work permit.** "Public waters work permit" means a permit issued by the commissioner under Minnesota Statutes, section 103G.245.

Subp. 32. **Reconstruction.** "Reconstruction" means the rebuilding or renovation of an existing structure, where the cost of such work will exceed 50 percent of the replacement cost.

Subp. 33. **Regional flood.** "Regional flood" means the flood which is representative of large floods known to have occurred generally in Minnesota and reasonably characteristic of what can be expected to occur on an average frequency in the magnitude of the 100-year recurrence interval.

Subp. 34. **Retaining walls.** "Retaining walls" means vertical or nearly vertical structures constructed of mortar-rubble masonry, handlaid rock or stone, vertical timber pilings, horizontal timber planks with piling supports, sheet pilings, poured concrete, concrete blocks, or other durable materials and constructed approximately parallel to the shoreline.

Subp. 35. **Riprap shore protection.** "Riprap shore protection" means coarse stones, boulders, cobbles, artificially broken rock or concrete, or brick materials laid loosely or within gabion baskets against the slope of the existing bank of a public water.

Subp. 36. [Repealed, 27 SR 529]

Subp. 36a. **Shoreline zone.** "Shoreline zone" means an area immediately waterward of the ordinary high water level that may include the littoral area of a water body.

Subp. 37. **Structure.** "Structure" means any building, footing, foundation, slab, roof, boathouse, deck, wall, dock, bridge, culvert, or any other object extending over or under, anchored to, or attached to the bed or bank of a public water.

Subp. 38. **Structural height.** "Structural height" means the vertical distance from the natural bed of the stream or watercourse measured at the downstream toe of the control structure or from the lowest elevation of the outside limit of the control structure, if it is not across a stream channel or watercourse, to the maximum storage elevation.

Subp. 39. **Swellhead.** "Swellhead" means the difference between the headwater elevation necessary to pass the regional flood through the proposed structure and the tail water elevation below the structure.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

Subp. 40. **Temporary structure.** "Temporary structure" means any dock, floating structure, watercraft lift, watercraft canopy, or other structure that can be removed from public waters by skidding intact or by disassembly with hand tools.

Subp. 41. **Watercourse.** "Watercourse" means any channel having definable beds and banks capable of conducting generally confined runoff from adjacent lands. During floods water may leave the confining beds and banks but under low and normal flows water is confined within the channel. A watercourse may be perennial or intermittent.

Subp. 42. **Water level control structure.** "Water level control structure" means any structure which impounds or regulates the water surface elevation or flow of public waters, including dams regulated under the provisions of parts 6115.0300 to 6115.0520.

Subp. 42a. **Watercraft canopy.** "Watercraft canopy" means a structure or device with a fabric covered roof and without walls or a floor that is placed on the bed of a public water, is designed to shelter watercraft, and is designed and constructed so that all components may be removed from the lake or stream bed on a seasonal basis by skidding intact or by disassembly with hand tools.

Subp. 42b. **Watercraft lift.** "Watercraft lift" means a structure or device without walls that is placed on the bed of a public water, is designed to lift watercraft above the level of the public water when not in use, and is designed and constructed so that all components may be removed from the lake or stream bed on a seasonal basis by skidding intact or by disassembly with hand tools. A watercraft lift may be designed to include a fabric covered roof.

Subp. 43. **Wharf.** "Wharf" means a permanent structure constructed into navigable waters as a part of a port facility for berthing or mooring commercial watercraft, or for transferring cargo to and from watercraft in an industrial or commercial enterprise, or for loading or unloading passengers from commercial watercraft, or for the operation of a port facility.

6115.0180 [Repealed by amendment, 8 SR 533]

Posted: *June 11, 2008*

6115.0190 FILLING INTO PUBLIC WATERS.

Subpart 1. **Goals.** It is the goal of the department to limit the placement of any fill material into public waters in order to:

A. minimize encroachment, change, or damage to the environment;

B. regulate the quantity and quality of fill and the purposes for which filling may be allowed based upon the capabilities of the waters to assimilate the material; and

C. maintain consistency with floodplain, shoreland, and wild and scenic rivers management standards and ordinances.

Subp. 2. **Scope.** Filling as used in this part involves placement of unconfined or loosely confined materials in public waters.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

Subp. 3. **Prohibited placement.** Placement is prohibited in the following cases:

A. to achieve vegetation control;

B. to create upland areas, except where expressly provided herein;

C. to stabilize beds of public waters which cannot support fill materials because of excessive depths of muck, steep bank, bed slope, or other conditions;

D. to stabilize or impound the site of active springs;

E. to dispose of rock, sand, gravel, or any other solid material resulting from activities carried out above the ordinary high water level;

F. to construct a roadway or pathway, or create or improve land accesses from peripheral shorelands to islands, or to facilitate land transportation across the waters; however, when a project is proposed by a federal, state, or local government agency and this provision would prevent or restrict the project, or create a major conflict with other public purposes or interests, the commissioner may waive this provision if:

(1) there is no other feasible and practical alternative to the project that would have less environmental impact; and

(2) the public need for the project rules out the no-build alternative; or

G. filling posted fish spawning areas.

Subp. 4. **No permit required.** No permit is required for the following activities unless prohibited under subpart 3:

A. to install a beach sand blanket if:

(1) the sand or gravel layer does not exceed six inches in thickness, 50 feet in width along the shoreline, or one-half the width of the lot, whichever is less, and does not extend more than ten feet waterward of the ordinary high water level;

(2) the beach sand blanket does not cover emergent vegetation, unless authorized by an aquatic plant management permit; and

(3) local watershed district and local zoning officials are given at least seven days notice by the landowner;

B. for one additional installation of a sand or gravel layer subsequent to an initial installation at the same location and not exceeding the same amounts and dimensions allowed under item A; or

C. to place fill in a public watercourse having a total drainage area, at its mouth, of five square miles or less, if the watercourse is not an officially designated trout stream and the placement of fill does not result in:

(1) any diversions of water from the drainage area;

(2) any impoundment of waters by damming the watercourse; or

(3) any actions that would result in erosion and cause sedimentation of downstream waters as determined by the county or local soil and water conservation district.

Subp. 5. **Permits required.** Permits are required for the placement of fill in public waters, except as provided under subparts 3 and 4, and a project must meet all of the following requirements:

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

A. the project does not exceed more than a minimum encroachment, change, or damage to the environment, particularly the ecology of the waters;

B. the fill consists of clean inorganic material that is free of pollutants and nutrients;

C. the existence of a stable, supporting foundation is established by appropriate means, including soil boring data where deemed necessary by the commissioner;

D. where erosion protection is deemed necessary by the commissioner, the site conditions and fill material are capable of being stabilized by an approved erosion control method such as riprap, retaining wall, or other method which is consistent with existing land uses on the affected public water;

E. the proposed project represents the minimal impact solution to a specific need with respect to all other reasonable alternatives;

F. the size, shape, depths, shoreline, and bottom character and topography, and susceptibility of the beds of public waters to actions of wind, waves, and currents are such that the fill will be stable;

G. adverse effects on the physical or biological character of the waters are subject to feasible and practical measures to mitigate the effects;

H. the proposed filling is consistent with applicable floodplain, shoreland, and wild and scenic rivers management standards and ordinances for the waters involved; and

I. the proposed filling is consistent with water and related land management plans and programs of local and regional governments, provided such plans and programs are consistent with state plans and programs.

6115.0191 SPECIFIC STANDARDS; FILLING.

Subpart 1. **In general.** In addition to compliance with the general standards in part 6115.0190, subparts 2 to 5, specific requirements for certain activities shall be met as follows.

Subp. 2. [Repealed, 27 SR 529]

Subp. 3. **Navigational access.** Filling to gain navigational access to waters shall be permitted only where access to navigable depths cannot be reasonably attained by utilizing a dock, the excavation of an offshore access channel, or other alternatives which would result in less environmental impact.

Fill for navigational access shall not extend beyond the edge of open water, shall not exceed side slopes greater than 2:1 horizontal:vertical, shall not exceed a maximum width of 15 feet at the base of the fill, and shall not extend to a water depth greater than four feet.

Subp. 4. **Shoreline lost by erosion.** Permits for filling to recover shoreland lost by erosion or other natural forces shall be granted if:

A. the loss of shoreline is a threat to health and safety through the impending loss or damage to existing shoreline developments; or

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

B. the loss of shoreline has occurred as a result of changes in water level or flow conditions caused by artificial manipulation of flows or levels of the waters involved within a period of not more than five years prior to the date when an application for filling is submitted.

The requirements of items A and B do not preclude the issuance of permits to recover up to 400 square feet of eroded area or to place riprap materials or use other structural means for protection of the shoreline to prevent continuous erosion.

Subp. 5. **Port development or improvement.** Filling necessary for port development or improvement is allowed only on those waters that are under the jurisdiction of established port authorities subject to the following:

A. no filling is allowed to extend beyond the limits of federally established harbor lines, or when no harbor line has been established, beyond the maximum distance waterward which could be attained without obstructing navigational use of the waters;

B. the proposed development is part of a comprehensive port development plan that has been approved by the commissioner; and

C. adverse effects of the proposed filling on the physical and biological character of the area are subject to mitigation measures approved by the commissioner.

Subp. 6. **Fish and wildlife habitat.** Filling to restore or improve fish and wildlife habitat, except for filling in designated trout streams, shall be permitted provided plans are submitted showing the nature and degree of habitat to be benefited, and the project will not create other adverse effects such as flooding, erosion, sedimentation, or navigational obstructions.

Subp. 7. **Trout streams.** Filling in trout streams officially designated by the commissioner is allowed only if:

A. the amount, method of placement, and location of the fill will not result in increased water temperatures, excessive sedimentation in the stream, or destruction of fish habitat; and

B. there is no other feasible or practical alternative other than filling.

Subp. 8. **Other purposes.** Filling for other purposes not specifically listed shall be subject to the general standards in part 6115.0190, subparts 2 to 5 and submission of information to show that:

A. the intended purpose of the fill is reasonable with respect to all other alternatives and there are no feasible and practical means to attain the intended purpose without filling; and

B. the proposal will adequately protect public safety and promote the public welfare.

6115.0200 EXCAVATION OF PUBLIC WATERS.

Subpart 1. **Goals.** It is the goal of the department to limit the excavation of materials from the beds of public waters in order to:

A. preserve the natural character of public waters and their shorelands, in order to minimize encroachment, change, or damage to the environment, particularly the ecosystem of the waters;

B. regulate the nature, degree, and purpose of excavations so that excavations will be compatible with the capability of the waters to assimilate the excavation; and

C. control the deposition of materials excavated from public waters and protect and preserve the waters and adjacent lands from sedimentation and other adverse physical and biological effects.

Subp. 2. **Scope.** Excavation as used in this part includes any activity that results in the displacement or removal of bottom materials or the widening, deepening, straightening, realigning, or extending of public waters. It may involve proposals for excavations landward or waterward from the ordinary high water level.

Subp. 3. **Prohibited excavation.** Excavation is prohibited in the following cases:

A. where it is intended to gain access to navigable water depths when such access can be reasonably attained by alternative means which would result in less environmental impact;

B. where inland excavation is intended to extend riparian rights to nonriparian lands, or to promote the subdivision and development of nonriparian lands;

C. when the proposed excavation will be detrimental to significant fish and wildlife habitat and there are no feasible, practical, or ecologically acceptable means to mitigate the effects;

D. when the proposed excavation will take threatened or endangered species listed in chapter 6134 without authorization by the commissioner according to parts 6212.1800 to 6212.2300;

E. where it is intended to provide fill materials for development purposes except as provided under part 6115.0280;

F. where the excavation would not provide an effective solution to a problem because of recurrent sedimentation and there are feasible and practical alternative solutions which do not require excavation;

G. unless the excavation project includes provisions for acceptable disposal of excavated materials as provided in these rules; or

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

H. where the excavation would cause increased seepage of water which would lower the water level of public waters and result in subsurface drainage.

Subp. 4. **No permit required.** No permit for excavation is required for the following activities unless prohibited in subpart 3:

A. for excavations in a public watercourse having a total drainage area, at its mouth, of five square miles or less, if the watercourse is not an officially designated trout stream and the excavation will not result in:

(1) any diversions of water from the drainage area;

(2) any impoundment of waters by damming the watercourse; or

(3) any actions that would result in erosion and cause sedimentation of downstream waters as determined by the county or local soil and water conservation district;

B. to remove debris such as trees, logs, stumps, and trash provided such removal does not alter the original alignment, slope, or cross-section of the waters; or

C. for repair of a public drainage system lawfully established under Minnesota Statutes, chapters 103D and 103E, and sponsored by the public drainage authority consistent with the definition of "repair" in Minnesota Statutes, section 103E.701, subdivision 1.

Subp. 5. **Permits required.** Permits are required for the excavation and removal of any materials from public waters or any excavations extending into or out of public waters, except as provided in subparts 3 and 4, and a project is subject to the following general criteria:

A. the project is reasonable and practical based upon geologic and hydrologic conditions, including but not limited to:

(1) quantity and quality of local drainage at the site;

(2) type of sediment/soil strata and underground formations in the vicinity;

(3) life expectancy of the excavation with respect to bedload, longshore drift, and siltation patterns in the project vicinity; and

(4) protection of the water body from increased seepage, pollution, and other hydrologic impacts;

B. the disposal of excavated materials is subject to the following requirements:

(1) the disposal of any excavated materials containing pollutants is subject to requirements of Minnesota Statutes, chapter 115; and

(2) the most acceptable means of disposing of clean materials, free from pollutants, that are excavated from public waters listed in order of preference are:

(a) complete removal of excavated materials from the waters and disposal or reuse for other purposes outside of the floodplain;

(b) deposition in stable on-land disposal sites located above the ordinary high water level and outside of floodway districts established under local ordinance. Provisions must be included for sodding, seeding, or otherwise properly stabilizing these materials;

(c) temporary deposition along shorelines or within floodplains by stockpiling materials for subsequent removal to areas outside of any public waters and outside of established floodplain

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

districts provided that: any stockpile materials are removed within one year of stockpiling; and the stockpile is constructed so that any materials or waters entering or leaving the stockpile are controlled to prevent any introduction of sediment into the environment surrounding the stockpile;

(d) redeposition of excavated materials, consisting of inorganic materials free from pollutants, into public waters shall only be permitted when it will result in improvement of natural conditions of public waters for the public benefit and will not result in sedimentation, obstruction of navigation, or a loss of fish or wildlife habitat. Separate permit provisions are required for redeposition of excavated materials subject to the standards and criteria of subparts 2 to 5; and

(e) determination of the public benefit served by redeposition of excavated materials is based on the value to the public of redeposited materials in order to protect shorelines from the damaging effects of erosion due to winds and waves when there are no other feasible, practical, and ecologically acceptable means to protect the shoreline; or create or improve habitat areas for fish and wildlife; or mitigate or enhance the physical and biological environment within public waters when mitigative or enhancement measures are required as a condition of a permitted activity within the waters involved and there are no other feasible, practical, and ecologically acceptable mitigative measures;

C. the proposed project represents the "minimal impact" solution to a specific need with respect to all other reasonable alternatives and does not exceed more than a minimum encroachment, change, or damage to the environment, particularly the ecology of the waters;

D. the excavation is limited to the minimum dimensions necessary for achieving the desired purpose;

E. when excavation is proposed in a public water that is perched on an impervious stratum, soil borings show that the proposed excavation will not rupture the impervious stratum;

F. the biological character of the waters and surrounding shorelines is affected to the minimum degree feasible and practical;

G. adverse effects on the physical or biological character of the waters are subject to feasible and practical measures to mitigate the effects;

H. the water supply, navigational, and drainage characteristics of the waters is protected to ensure that the interests of the public and of private riparian landowners are not adversely affected by the proposed excavation;

I. the proposed excavation is consistent with applicable floodplain, shoreland, and wild and scenic rivers management standards and ordinances for the waters involved;

J. the proposed excavation is consistent with plans and management programs of local and regional governments, provided that such plans are consistent with state plans and programs; and

K. for harbors, boat slips, and other mooring facilities, the excavation is appropriately sized to provide a single mooring space for each riparian lot to be served. The number of mooring spaces to be provided shall generally be the amount of natural shoreline to be served divided by the lot requirements of the local land use control authority and the state shoreland management standards.

6115.0201 SPECIFIC STANDARDS; EXCAVATION.

Subpart 1. **In general.** In addition to compliance with the general standards in part 6115.0200, subparts 2 to 5, specific requirements shall be met for the activities described in subparts 2 to 7.

Subp. 2. **Excavations for beach development.** The existing site conditions will not provide a suitable beach using a sand blanket alone. When the proposal includes the installation of a beach sand blanket, the area to be excavated shall be consistent with the criteria for filling under part 6115.0190, subparts 2 to 5. The depth of excavation needed to reach a suitable beach stratum shall be the minimum depth necessary considering anticipated site maintenance and reasonable water depths for a beach.

Subp. 3. **Waterbasin excavations.** Excavations for improvement or enhancement of hydrologic and biologic conditions in all, or large portions of waterbasins:

A. A public need for the excavation has been established by local governmental resolution specifying the public interests to be improved or enhanced, except where the project is state sponsored.

B. The proposed project is intended to achieve one or more of the following public purposes:

(1) to improve navigation, swimming, and other recreational uses;

(2) to reduce winter fish-kill potential;

(3) sediment removal to eliminate a source of nutrients and/or contaminants.

C. The proposed excavation is part of an overall improvement or enhancement project based upon adequate background and field test data for which a comprehensive plan is submitted at the time of application detailing all of the following:

(1) Objectives to be accomplished, and an analysis of any alternative means considered to meet the objectives and the rationale for selecting excavation.

(2) Sufficient soil boring and bottom sampling data to evaluate sediment quality and bottom "seal" conditions. Where excavation is proposed on a waterbasin that is perched on an impervious stratum, soil borings must show that the proposed excavation will not rupture the impervious stratum.

(3) The methods, uses, and locations to be employed in excavating and disposing of excavated material consistent with the provisions of parts 6115.0190 to 6115.0192.

(4) Existing water quality data and provision for future water quality monitoring including any water returned to the waterbasin during the removal of excavated materials.

(5) A timetable which indicates anticipated yearly excavation areas and volumes of materials to be removed, plus the selected disposal methods, uses, and deposition locations for each excavation period.

(6) A detailed description of proposed excavation and disposal equipment and facilities, including, where applicable, the length of discharge pipe purchased or available for the project and the pumping characteristics of the equipment.

Subp. 4. **Excavations for navigation-related purposes.** Excavations for navigation-related purposes:

A. Access channels from shorelines for recreational craft. Excavations for accesses from shorelines to reach navigable depths shall not be allowed if access could reasonably be obtained through use of a dock to reach navigable depths, and prevalent wind, wave, and current conditions would not impair reasonable access to reach navigable depths.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

When shoreline conditions and wind, wave, and current conditions preclude access to navigable depths, excavations for navigational access shall be allowed provided the access channel shall not exceed four feet in depth, more than 15 feet in bottom width, and will not extend to an offshore water depth greater than four feet.

B. Other navigational channels. Excavations shall be limited to the minimum depth and width necessary to allow reasonable use of anticipated watercraft.

Excavations to provide maintenance of navigational channel projects shall be limited to the length, width, and depth dimensions of the original channel.

Subp. 5. **Harbors and boat slips.** Harbors and boat slips:

A. Excavations for development of offshore or inland harbors or boat slips for the mooring of more than 25 watercraft or watercraft larger than 20 feet in length shall be restricted to those waters which have the following characteristics:

(1) waterbasins having areas of 1,000 acres or more;

(2) watercourses which are used for commercial or industrial navigational purposes.

B. Excavations for development of offshore harbors serving fewer than 25 watercraft shall be limited to those water areas where the location of the proposed offshore harbor would not create unreasonable obstructions to public use and navigation on the water involved. Unreasonable obstructions include any development which would result in threats to public health, safety, or welfare.

C. Excavations for development of private inland harbors or boat slips serving fewer than 25 watercraft or watercraft less than 20 feet in length shall be limited to those waters where:

(1) prevalent wind, wave, or current conditions along the shoreline where excavation is proposed are of a magnitude and frequency which precludes the use and maintenance of docks to moor watercraft. Determinations of magnitude and frequency which would inhibit use of docks shall be based on supporting facts including:

(a) the character of the water involved and its shoreline in relation to exposure to severe wind, wave, or current actions and the configuration and area of the water;

(b) the frequency of occurrence of storms producing severe winds and waves based on climatological data for the area; and

(c) the average number of days during each month of the navigational season when the shoreline is affected by severe winds, waves, or currents;

(2) the presence of lake bed and bank conditions would preclude the use and maintenance of docks and the conditions of the site and the number, type, or size of watercraft intended to be moored would preclude the development and use of on-land facilities, such as rollers, winch and track systems, sliderails, or other facilities which could be used to haul watercraft out of the water for on-land storage; or

(3) the proposed site is located in an area of the water body where offshore mooring or excavations or extensive dock development would create unreasonable obstructions to public use and navigation of the water body.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

D. The width and length of boat slips shall not exceed 150 percent of the width and length of the anticipated watercraft and all authorized boat slips shall be oriented to maximize the degree of wave protection.

E. Excavations for development of inland harbors shall be limited to those waters described in item C and shall meet the following additional requirements:

(1) Requirements applicable to all commercial and industrial inland harbors:

(a) The mooring area of the harbor shall be compactly shaped in order to minimize the surface area excavated in relation to the number of mooring spaces to be provided and shall be located at an adequate distance from the shoreline to provide wave protection and prevent breakthrough.

(b) No branch or connecting channels shall be permitted extending laterally outward from authorized inland excavations.

(c) If practical, a "dogleg" shall be incorporated in the approach channel located between the mooring area and the shoreline to minimize visual impact from the water body and promote wave dissipation.

(d) The excavation shall not extend more than 200 feet inland from the public water unless evidence is provided to show that greater distances are required because of the dimensions of the watercraft to be moored.

(e) The methods, use, and deposition locations to be employed in disposing of excavated materials shall be consistent with the provisions of part 6115.0200, subpart 5, item B.

(2) An application for a permit shall contain plans, maps, and supporting data regarding proposed excavation site soil borings, ground water levels and characteristics, water quality, topography, drainage, and vegetation which shall substantiate that the proposed project must be reasonable and practical based upon geologic and hydrologic conditions including:

(a) quantity and quality of stream flow and local drainage at the proposed project site;

(b) water stagnancy problems including the capability of being flushed or drained;

(c) interference with stream flow or longshore drift;

(d) type of soil strata and underground formations in the project vicinity;

(e) protection of the water body itself in terms of reduced water supply, increased seepage or drainage, pollution, increased flooding, and other adverse hydrological impacts;

(f) adequate entrance openings;

(g) ample turning radius;

(h) adequate depth and size for the anticipated watercraft usage;

(i) adequate reduction of wave heights in mooring areas;

(j) proper harbor shape to reduce wave resonance;

(k) need for and feasibility of maintenance dredging;

(l) adequate height of perimeter wall;

(m) need for wave absorbers within the harbor; and

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(n) bank stabilization by appropriate erosion control measures.

(3) Additional requirements applicable to specific types of harbors. Private inland harbors serving two or more single family residential riparian lots shall, if practical, be located along the mutual boundary of properties to be served.

Private inland harbors for proposed multifamily or cluster developments, residential planned unit developments, or for resorts, campgrounds, or other commercial purposes. The development plan shall be approved by the local governmental unit. The permit shall be of the title-registration type including a provision that the individual waterfront lots in the development have priority rights to the available mooring spaces thus obviating issuance of future permits for individual harbors for these lots. The harbor shall be appropriately sized, consistent with the number of watercraft to be served. For residential and commercial planned unit developments, the number of mooring spaces to be permitted shall be consistent with part 6120.3800.

Public inland harbor projects must be justified by:

(a) a public need for the proposed inland harbor established by local governmental resolution specifying public interests to be enhanced;

(b) the harbor shall be appropriately sized consistent with the demand for mooring facilities in the area and the number of watercraft to be served;

(c) the harbor shall be available for use by the general public; and

(d) the harbor may extend more than 200 feet inland provided the plans minimize the total length by which the public water is proposed to be extended in keeping with the number of watercraft to be served and the topography.

Subp. 6. **Excavations for fish and wildlife habitat improvement.** Excavation to restore or improve fish and wildlife habitat require plans showing the nature and degree of habitat to be benefited, and information showing that the project will not create other adverse effects such as flooding, erosion, sedimentation, or navigational obstructions.

Excavations in trout streams officially designated by the commissioner shall be allowed only if:

A. the amount, method, and location of the excavation will not result in increased water temperatures, cause excessive sedimentation in the stream, or destruction of fish habitat; and

B. there is no other feasible or practical alternative other than excavation.

Subp. 7. **Excavations in public watercourses.** Except as noted in part 6115.0200, subpart 4, a permit shall be required for any excavation in a public watercourse and shall be subject to the following specific requirements in addition to the general requirements of part 6115.0200, subparts 2 to 5:

A. The watercourse capacity shall be sufficient to adequately convey normal runoff.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

B. The watercourse bottom gradients shall be such that normal low flow velocities are nonerosive and the sideslopes shall be graded such that bank slumping is not a hazard. Where excavation will result in excessive bank erosion, energy dissipation structures, channel and bank protection, or other engineering measures shall be required.

C. The outlet shall be adequate in that it:

(1) sufficiently conveys the discharge waters from the area proposed for excavation;

(2) does not produce substantial increases in downstream overbank flooding; and

(3) does not produce downstream erosion hazards as a result of the watercourse excavation.

D. When projects involve widening or straightening which alters the watercourse banks, all sideslopes which contribute direct surface runoff into the authorized altered watercourse, and a strip of land along both sides of the watercourse, one rod wide or to the top of the spoil bank, whichever is the greater, shall be seeded and maintained in permanent grasses. No mowing of this grassed strip shall be allowed until after July 31 of each year.

E. The alignment and slope of the excavated channel shall be such as to provide a smooth transition between the existing and the excavated channel.

F. Disposal of excavated material from channel excavation shall be consistent with part 6115.0200, subpart 5, except where the original channel is allowed to be filled as part of the project.

G. No significant increase in flood damages will be permitted. Floodwater retardance structures may be required to minimize any increase in flood damage.

H. The applicant shall submit the names and addresses of landowners located immediately upstream, downstream, and adjacent to any proposed watercourse alteration resulting from excavation. In addition, the applicant shall submit the names and addresses of other landowners and occupants that the commissioner, after reviewing the plans for the proposed excavation, believes will have a substantial interest in the channel change or will be substantially affected by the watercourse alteration.

I. The preferred alternative to widening, deepening, or straightening a watercourse for control of flood waters is the construction of water impoundment structures in upstream areas. Where impoundments are infeasible, impractical, or would result in adverse effects on health and safety or greater adverse environmental effects, the preferred alternative is the construction of flood bypass channels to convey high velocity flood flows.

Excavations in public watercourses for flood management purposes shall be allowed only where an upstream impoundment or a flood bypass channel is infeasible or impractical or excavation is the least damaging environmentally.

Excavations for widening, deepening, or straightening portions of watercourses shall be based on flood management plans which provide details on the relationship of the proposed excavation to management of flood flows for the entire watercourse and shall be consistent with state standards and state

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

approved local standards for floodplain management including maximum use of nonstructural measures where feasible and practical.

J. Excavations shall be limited to the minimum extent necessary to facilitate construction of the road crossing and shall include provisions for adequate riprap or other bank protection measures to protect altered banks from erosion.

K. Excavations for construction of sediment traps or settling basins to control sedimentation and water quality shall be based on plans approved by the Pollution Control Agency or the local soil and water conservation district and shall be consistent with any state and local standards, regulations, and requirements.

L. Watercourse channel excavations to restore or improve fish and wildlife habitat shall require plans showing the nature and degree of habitat to be benefited, and information showing that the project will not create other adverse effects such as flooding, erosion, sedimentation, or navigational obstructions.

M. Watercourse channel excavations in trout streams officially designated by the commissioner shall only be allowed if:

(1) the amount, method, and location of the channel excavation will not result in increased water temperatures, cause excessive sedimentation in the stream, or destruction of fish habitat; and

(2) there is no other feasible or practical alternative other than channel excavation.

N. The straightening or realignment of a watercourse with a total drainage area, at its mouth, greater than five square miles shall only be permitted where the project will not result in increased downstream flooding, erosion, or sedimentation. Where it is proposed to straighten or realign a watercourse with a total drainage area, at its mouth, greater than five square miles, the applicant may be required to submit appropriate hydraulic data. Such data may include:

(1) contributing watershed above the project;

(2) data for the flood of record;

(3) maximum observed high water level;

(4) flow data, based on the best available technology as follows:

(a) existing and proposed time of concentration;

(b) existing and proposed stage downstream;

(c) existing and proposed mean velocity downstream;

(5) certification that the data was prepared by a registered professional engineer.

O. The alteration of watercourses by straightening or realigning channels to facilitate adjacent land use shall be allowed only if the applicant provides evidence:

(1) that the alteration is reasonable, practical, and will adequately protect public safety and welfare; and

(2) that the alteration will involve a minimum of encroachment, change, or damage to the environment, particularly to the ecological system of the waterway.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

P. All other proposals for excavations in public watercourses shall meet the general requirements of part 6115.0200, subparts 2 to 5 and the specific requirements of subparts 2 to 6 and shall require submission of supporting evidence as provided in items N and O.

6115.0202 RELATIONSHIP TO STANDARDS AND CRITERIA FOR OTHER ACTIVITIES INVOLVING CHANGES IN COURSE, CURRENT, OR CROSS-SECTION.

Unless otherwise specified in other parts, parts 6115.0200 and 6115.0201 shall apply to excavations proposed as part of any other activity or activities including but not limited to: filling, parts 6115.0190 to 6115.0192; structures, parts 6115.0210 to 6115.0212; water level controls, parts 6115.0220 to 6115.0222; bridges and culverts, parts 6115.0230 to 6115.0232; drainage of public waters, parts 6115.0270 to 6115.0272; and alterations of public waters for mining, part 6115.0280.

6115.0210 STRUCTURES IN PUBLIC WATERS.

Subpart 1. **Goals.** It is the goal of the department to limit the occupation of public waters by offshore navigational facilities, retaining walls, and other structures in order to:

A. preserve the natural character of public waters and their shorelands;

B. provide a balance between the protection and utilization of public waters; and

C. encourage the removal of existing structures which do not serve the public interest from the beds of public waters at the earliest practicable date.

Subp. 2. **Scope.** This part applies to the placement, construction, reconstruction, repair, relocation, abandonment, or removal of any structure placed on or in public waters.

Subp. 3. **Prohibited placement of structures.** Placement of structures, temporary structures, and floating structures is prohibited when the structure, temporary structure, or floating structure:

A. will obstruct navigation or create a water safety hazard;

B. will be detrimental to significant fish and wildlife habitat. Construction is prohibited in posted fish spawning areas;

C. is designed or intended to be used for human habitation or as a boat storage structure;

D. is designed or intended to include walls, a roof, or sewage facilities; or

E. will take threatened or endangered species listed in chapter 6134 without authorization by the commissioner according to parts 6212.1800 to 6212.2300.

Subp. 4. **No permit required.** No permit is required for the following activities, unless prohibited under subpart 3:

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

A. to construct, reconstruct, or install a dock, floating or temporary structure, watercraft lift, or mooring facility if:

(1) the structure or mooring facility will not constitute a hazard to navigation or public health, safety, and welfare, as determined by the commissioner;

(2) the structure will allow the free flow of water beneath it;

(3) the structure or mooring facility is not used or intended to be used as a marina;

(4) the structure or mooring facility is consistent with or allowed under local land use controls, as determined by the local government land use authority;

(5) the length of the structure is limited to that necessary to accomplish its intended use, including reaching navigable water depths;

(6) the structure, other than a watercraft lift or watercraft canopy, is not more than eight feet in width and is not combined with other similar structures so as to create a larger structure; and

(7) docks placed on rock filled cribs are located only on waters where the bed is predominantly bedrock, which is incapable of accepting pilings;

B. to construct or reconstruct a boat launching ramp if:

(1) privately owned ramps do not exceed 12 feet in width and do not extend more than ten feet beyond the shoreline or into water more than four feet in depth, whichever is less. Excavations five cubic yards or less, and placement of up to five cubic yards of crushed rock, gravel, clean sand, or small stone are allowed to provide a stable base or maintain use of the ramp;

(2) publicly owned ramps do not exceed 36 feet in width and do not extend more than 30 feet waterward of the shoreline or into water more than four feet in depth, whichever is less. Excavations of 200 cubic yards or less, and placement of up to 80 cubic yards of crushed rock, gravel, clean sand, or small stone are allowed to provide a stable base or maintain use of the ramp. The use of coffer dams constructed of metal sheet piling or other portable materials is allowed to construct and maintain public boat launching ramps if all materials are completely removed from public waters within 30 days of completion of the project;

(3) the ramp is constructed of gravel, natural rock, concrete, steel matting, or other durable inorganic material not exceeding seven inches in thickness; and

(4) the ramp is not located on a federally designated wild and scenic river; or

C. to remove structures or other waterway obstructions if:

(1) the original cross-section and bed conditions are restored insofar as practicable;

(2) the structure is completely removed including any footings or pilings that obstruct navigation;

(3) the structure is not located on an officially designated trout stream; and

(4) the structure does not function as a water level control device.

Subp. 5. **Permits required; criteria.** Permits are required for the construction, reconstruction, repair, or relocation of any structure or mooring facility on or in public waters, except as provided under subparts 3 and 4, and a project must meet the following general criteria:

A. the proposed project must represent the minimal impact solution to a specific need with respect to all other reasonable alternatives;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

B. the project does not exceed more than a minimum encroachment, change, or damage to the environment, particularly the ecology of the waters;

C. the proposed structure is consistent with applicable floodplain, shoreland, and wild and scenic rivers management standards and ordinances for the waters involved;

D. adverse effects on the physical or biological character of the waters are subject to feasible and practical measures to mitigate the effects;

E. the proposed structure is consistent with water and related land management plans and programs of local and regional governments, provided these plans and programs are consistent with state plans and programs; and

F. except for mooring facilities and boat ramps, all new structures have a title-registered permit, unless a public agency or local governmental unit accepts responsibility for future maintenance or removal.

Statutory Authority: *MS s 103G.315; 105.415*

History: *8 SR 533; 25 SR 143; 27 SR 529*

Posted: *June 11, 2008*

6115.0211 SPECIFIC STANDARDS; STRUCTURES.

Subpart 1. **In general.** In addition to compliance with the general standards in part 6115.0210, subparts 2 to 5, specific requirements shall apply to the activities described in subparts 3 to 8.

Subp. 2. [Repealed, 27 SR 529]

Subp. 3. **Wharves.** A permit is required for the construction or reconstruction of all wharves. The following order of preference for construction types shall be utilized: bulkheaded shoreline, inland slip with bulkheaded sidewalls, and wharf projecting into public waters.

Wharves shall be approved if the structure:

A. is part of a designated port facility;

B. is consistent with local land use plans and ordinances;

C. does not extend further waterward than any existing wharves in the area or beyond any established harbor line, whichever is less;

D. is of the minimum practicable size; and

E. is not an obstruction to flood flows or longshore drift and is adequately designed to resist the natural forces of ice, wind, and wave.

Subp. 4. **Breakwaters.** A permit is required for the construction or reconstruction of all offshore breakwaters. These structures shall be approved if the following general conditions and the additional listed specific conditions are met:

A. alternative dock or inland facilities are infeasible;

B. the structure is limited to those waters where:

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(1) prevalent wind, wave, or current conditions along the shoreline are of a magnitude and frequency that preclude the use and maintenance of docks to moor watercraft. Determinations of magnitude and frequency that would inhibit the use of docks is based on supporting facts including:

(a) the character of the water involved and its shoreline in relation to exposure to severe wind, wave, or current actions and the configuration and area of the water;

(b) the frequency of occurrence of storms producing severe winds and waves based on climatological data for the area; and

(c) the average number of days during each month of the navigational season when the shoreline is affected by severe wind, waves, or currents; and

(2) the conditions of the site and the number, type, or size of watercraft intended to be moored would preclude the development and use of on-land facilities, such as rollers, winch and track systems, sliderails, or other facilities that could be used to haul watercraft out of the water for on-land storage;

C. the facility is adequate in relation to appropriate engineering factors, including but not limited to those listed in part 6115.0201, subpart 5, item E, subitem (2), units (f) to (n);

D. the plan is adequate in relation to the geologic and hydrologic factors listed in part 6115.0201, subpart 5, item E, subitem (2), units (a) to (e);

E. the structure is designed in a compact fashion so as to blend in with the surrounding shoreline and so that all mooring and maneuvering activities can be normally confined to an area bounded by the property lines as extended into the public waters while minimizing the surface area occupied in relation to the number of watercraft to be served; and

F. the breakwaters do not exceed the minimum thickness necessary to withstand the anticipated forces consistent with maintenance requirements and are faced with an adequate layer of natural rock riprap of appropriate size and gradation.

Subp. 4a. **Mooring facilities.** Except as provided in part 6115.0210, subpart 4, item A, a permit is required for the construction of all offshore mooring facilities. A mooring facility shall be approved if the following general conditions and the additional listed specific criteria are met:

A. the mooring facility is designed in a compact fashion so as to blend in with the surrounding shoreline and so that all mooring and maneuvering activities can be normally confined to an area bounded by the property lines as extended into public waters while minimizing the surface area occupied in relation to the number of watercraft to be served;

B. the mooring facility minimizes encroachment waterward of the ordinary high water level;

C. for docks or mooring facilities more than eight feet in width, the applicant provides reasonable justification that the proposed width represents the minimal impact solution to a specific need with respect to all reasonable alternatives; and

D. offshore mooring facilities shall be approved, subject to the listed specific conditions:

(1) private offshore mooring facilities not serving as marinas, if the mooring facility is consistent with or allowed under local land use controls, as determined by the local government land use authority;

(2) public offshore mooring facilities not serving as marinas, if:

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(a) a local unit of government passes a resolution that specifies the public interests to be benefited by the proposal;

(b) the mooring facility is appropriately sized consistent with the demand for mooring facilities in the area and the number of watercraft to be served; and

(c) the mooring facility is available for use by the general public; and

(3) offshore marinas, if:

(a) the area is zoned for such use or the local government land use authority grants a land use permit; and

(b) the marina is sized consistent with the demand for mooring facilities in the area and the number of watercraft to be served.

Subp. 5. **Retaining walls and erosion and sedimentation control structures.** A permit is required for the construction or reconstruction of all retaining walls and erosion and sedimentation control structures that do not impound water. The construction of retaining walls is discouraged because their appearance is generally not consistent with the natural environment and their construction and maintenance cost is generally greater than riprap.

The issuance of permits is contingent on the following conditions:

A. existing or expected erosion problems preclude the use of riprap shore protection, there is a demonstrated need for direct shoreland docking, or the design is consistent with existing uses in the area. Examples are: riverfront commercial-industrial areas having existing structures of this nature, dense residential shoreland areas where similar retaining walls are common, resorts where floating docks may be attached to such a bulkhead, or where barges are utilized to transport equipment and supplies;

B. adequate engineering studies are performed of foundation conditions, tiebacks, internal drainage, construction materials, and protection against flanking;

C. the facility is not an aesthetic intrusion upon the area and is consistent with all applicable local, state, and federal management plans and programs for the water body; and

D. encroachment below the ordinary high water level is held to the absolute minimum necessary for construction.

Subp. 6. **Boat launching ramp.** A permit is required for the construction or reconstruction of any boat launching ramp not covered under part 6115.0210, subpart 4, item B, and shall be granted if:

A. the applicant demonstrates a need for a launching facility;

B. the proposed ramp is of the minimum dimensions necessary for launching of watercraft;

C. the proposed ramp does not obstruct flowing water; and

D. construction does not necessitate alteration of shoreland that could result in substantial erosion and sedimentation.

Subp. 6a. **Boathouses.** A permit is required for the construction, reconstruction, relocation, removal, or repair of a boathouse. The permit shall be granted if the following conditions are met:

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

A. the boathouse is located in an area of historic boathouse use. "Historic boathouse use" shall be determined by the commissioner and shall be based on a review of factual information such as photographs, local government comments, newspaper accounts, or other relevant information;

B. the boathouse is approved by the local unit of government by means of a resolution with supporting documentation that identifies the owner, length, width, height, number of rooms, and sanitary facilities of the boathouse; and

C. the boathouse was located on public waters before January 1, 1997.

Subp. 6b. **Energy exchangers.** A permit is required for the construction, reconstruction, relocation, or repair of energy exchangers located on the bed of a public water. The permit shall be granted if the following general conditions and the additional listed specific conditions are met:

A. there are no other feasible and practical alternative sites for the project that would have less environmental impact;

B. a closed loop design is utilized;

C. the facility is designed in accordance with sound engineering practices;

D. the facility is not located in a designated trout stream or lake, a designated wild and scenic river, or an outstanding resource value water as defined in part 7050.0180;

E. the facility is designed in a fashion and located so as not to cause a navigation hazard;

F. the facility will not exceed more than a minimum encroachment, change, or damage to the environment, particularly the ecology of the waters;

G. the facility will not take threatened or endangered species identified in chapter 6134 without authorization by the commissioner according to parts 6212.1800 to 6212.2300;

H. the facility will not contain substances, if released into public waters, that would be detrimental to water quality or plant or animal life forms; and

I. the construction, relocation, or reconstruction of privately owned structures shall be permitted only when a federal, state, or local governmental agency accepts responsibility for future maintenance of the facility or its removal in the event that the private owner fails to maintain or abandons the facility.

Subp. 7. **Other facilities.** A permit is required for the construction, reconstruction, relocation, removal, repair, and abandonment of all other offshore structures, boat storage structures, cables other than utility crossings, pilings, or other structures not covered by specific regulations.

A. Permits for structural repair, relocation, or modification, other than minor maintenance work such as reroofing, painting of structures, or similar work, shall be issued if all of the following conditions are met:

(1) the applicant demonstrates a need for the work;

(2) the cost of the work will not exceed 50 percent of the replacement cost of the structure;

(3) the degree of permanence of the structure will not be materially increased by virtue of constructing a new foundation or replacing the majority of the structure above the foundation;

(4) the structure being repaired has appropriate permits from the local land use or sanitary authority; and

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(5) the degree of obstruction or structure size is not increased.

B. Permits for construction, relocation, or reconstruction of publicly owned structures shall be issued where:

(1) public need is documented and outweighs adverse environmental impact;

(2) the site is adequately protected from the forces of ice and wave pressures; and

(3) the proposed construction is of sound design and is not necessarily obtrusive or visually incompatible with the natural surroundings.

C. The construction, relocation, or reconstruction of privately owned structures, other than docks and mooring facilities, shall be permitted only when a governmental agency or local unit of governmental accepts responsibility for future maintenance of the structure or its removal.

Subp. 8. **Removal of structures.** Where the commissioner has determined that a structure is no longer functional, constitutes a public nuisance or a hazard to navigation, or poses a threat to public health or safety, the structure shall be removed from public waters under the applicable provisions of these rules. Except as provided under part 6115.0210, subpart 4, item C, a permit is required for the removal or abandonment of all existing waterway obstructions including boathouses, bridges, culverts, pilings, piers, and docks. Permits shall be issued provided:

A. the original cross-section and bed conditions will be restored insofar as practicable;

B. adequate provisions are made to mitigate any side effects resulting from removal, such as restoration of wave or current forces; and

C. no portion of the structure remains which would obstruct or impair navigation, interfere with the passage of flood waters, or contribute to erosion and sedimentation.

6115.0212 RELATIONSHIP TO STANDARDS AND CRITERIA FOR OTHER ACTIVITIES INVOLVING CHANGES IN COURSE, CURRENT, OR CROSS-SECTION.

Unless otherwise specified in other parts, parts 6115.0210 and 6115.0211 shall apply to structures proposed as part of any other activity or activities including but not limited to: filling, parts 6115.0190 to 6115.0192; excavations, parts 6115.0200 to 6115.0202; water level controls, parts 6115.0220 to 6115.0222; bridges and culverts, parts 6115.0230 to 6115.0232; drainage of public waters, parts 6115.0270 to 6115.0272; and alterations of public waters for mining, part 6115.0280.

6115.0215 RESTORATION OF PUBLIC WATERS.

Subpart 1. **Goals.** It is the goal of the department to encourage the restoration of public waters to:

A. improve and protect fish and wildlife habitat and the diversity of the habitat;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

B. preserve the natural character of public waters and their shoreline zones;

C. encourage the use of natural materials for shoreline zone protection and restoration;

D. limit the removal of natural materials from the beds of public waters; and

E. prevent erosion and siltation of public waters, while maintaining natural processes.

Subp. 2. **Scope.** This part applies to placement, construction, reconstruction, repair, relocation, abandonment, or other work needed to restore or protect public waters or to removal of any materials, structure, fill, water level control, excavation, or drainage device placed on or in public waters. For purposes of this part, "restoration" means the repair, reconstruction, or recreation of essentially natural or native conditions of a public water and its shoreline or banks. This part does not apply to restoration orders issued by the commissioner consistent with part 6115.0255.

Subp. 3. **Prohibited work.** Public waters alteration, protection, or restoration work is prohibited when the work:

A. is detrimental to significant fish and wildlife habitat and there are no feasible, practical, or ecologically acceptable means to mitigate the effects;

B. takes threatened or endangered species listed in chapter 6134 without authorization by the commissioner according to parts 6212.1800 to 6212.2300;

C. obstructs navigation or creates a water safety hazard, as determined by the commissioner;

D. violates the regulations of any local zoning authority or water management agency;

E. results in the creation of land above the ordinary high water level that is not deemed essential by the commissioner as part of the project;

F. uses materials that are not clean and free of pollutants, nutrients, and exotic species sources;

G. manipulates water levels solely to satisfy private interests; or

H. will adversely impact public infrastructure, particularly roads and drainage systems.

Subp. 4. **No permit required.** No permit is required for the following activities, unless prohibited elsewhere in parts 6115.0150 to 6115.0280:

A. to perform bank or shoreline zone restoration work using willow wattles, willow posts, brush mattressing, brush layering, fiber roll breakwaters, plant carpets, root wads, and other natural materials installed by hand for the purpose of shoreline zone restoration work, if:

(1) the project is approved by the commissioner and designed or reviewed by the local soil and water conservation district or the local watershed district;

(2) the design does not interfere with navigation or other riparian uses of the waterbody;

(3) the project is done during times of the year when it will not interfere with fish spawning or the nesting of protected bird species;

(4) local origin native plant species, adapted for the site, are used;

(5) an aquatic plant management permit is obtained, when aquatic macrophytes are used;

(6) the waterward encroachment is the minimum necessary for the purpose of the project; and

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(7) a maintenance plan is developed for the project and a copy submitted for review to the department area fisheries office;

B. to remove or grade an ice ridge, if all of the following conditions are met:

(1) the ice ridge resulted from ice action within the last year;

(2) the project is either exempt from local permits or is authorized by issuance of a local government permit;

(3) the total length of shoreline zone to be affected does not exceed 200 feet;

(4) all ice ridge material that is composed of muck, clay, or organic sediment is deposited and stabilized at an upland site above the ordinary high water level of any public water;

(5) all ice ridge material that is composed of sand or gravel is removed as provided in subitem (4) or graded to conform to the original cross-section and alignment of the lakebed, with a finished surface at or below the ordinary high water level;

(6) no additional excavation or placement of fill material occurs on the site;

(7) all exposed areas are immediately stabilized as needed to prevent erosion and sedimentation; and

(8) local zoning officials, the watershed district, if applicable, and the soil and water conservation district are given seven days' prior notice;

C. to construct, reconstruct, or abandon a water level control structure on a public watercourse with a contributing watershed of 300 acres or less, except on officially designated trout streams, if the structure does not qualify as a dam under parts 6115.0300 to 6115.0520;

D. to excavate or place fill for the purpose of planting or collecting native aquatic plants for restoration purposes, if the work is authorized by an aquatic plan management permit; and

E. to install natural rock riprap and associated filter materials where there is a demonstrated need to prevent erosion or to restore eroded shoreline, when there is a demonstrated need for such work, except along the shores of Lake Superior and officially designated trout streams, if:

(1) the rock is sized appropriately with the erosion potential of the wave or current action of the particular water body, but in no case shall the rock average less than six inches in diameter or more than 30 inches in diameter;

(2) the rock is placed so that it conforms to the natural alignment of the shoreline zone;

(3) the finished slope, as measured on top of the rocks, is not steeper than three to one (horizontal to vertical);

(4) no materials are placed more than six feet waterward of the ordinary high water level, unless the commissioner determines that this dimension may be measured from another point due to the particular nature of water levels of the public water;

(5) the total length of shoreline to be affected does not exceed 200 feet for public waterbasins or public water wetlands or five times the width of the public watercourse measured at bank full conditions;

(6) the riprap does not cover emergent vegetation, unless authorized by an aquatic plant management permit;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(7) the riprap does not obstruct navigation or the flow of water;

(8) a filter, consisting of crushed rock, gravel, or suitable filter fabric material is placed underneath the rock; and

(9) the rock and any filter material are free from organic material, soil, clay, debris, trash, or any material that may cause siltation or pollute the waterbody.

Subp. 5. **Permit required; criteria.** A permit is required for the restoration of public waters, except as provided under subpart 4, and shall be granted if all of the following conditions are met:

A. the proposed project represents the minimal impact solution to a specific need with respect to all other reasonable alternatives;

B. the proposed project is intended to achieve one or more of the following purposes:

(1) improve navigational or recreational uses;

(2) improve or restore fish or wildlife habitat;

(3) expose sediment to remove or eliminate nutrients or contaminants;

(4) restore shorelines or watercourse channels to more natural conditions;

(5) improve or restore natural hydrologic conditions; or

(6) improve or restore water quality;

C. the project does not exceed more than a minimum encroachment, change, or damage to the environment, particularly the ecology of the waters;

D. adverse effects of the proposed project on the physical or biological character of the waters are avoided when possible and are subject to feasible and practical measures to mitigate the effects;

E. the proposed project is consistent with applicable floodplain, shoreland, and wild and scenic rivers management standards and ordinances for the waters involved;

F. the proposed project is consistent with water and related land management plans and programs of local and regional governments, provided the plans and programs are consistent with state plans and programs; and

G. projects that involve the placement of fill to recover shoreland lost by erosion or other natural forces are subject to part 6115.0191, subpart 4, except that part 6115.0191, subpart 4, does not preclude the issuance of a permit to place riprap materials or use other structural and vegetative means for protection of the shoreline zone to prevent continuing erosion.

6115.0216 SPECIFIC STANDARDS; RESTORATION.

Subpart 1. **In general.** In addition to compliance with the general standards in part 6115.0215, subparts 2 to 5, specific requirements apply to the activities described in subparts 2 to 6.

Subp. 2. **Riprap shore protection.** The protection of shoreline from continued erosion by placement of natural rock riprap along the shore shall be approved if:

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

A. the riprap materials are of sufficient size, quality, and thickness to withstand ice and wave action. The riprap must be placed with a minimum amount of space between the larger materials and the space between them must be filled with firmly seated smaller rocks or gabion baskets to procure a uniform surface;

B. the site soils are capable of supporting riprap and a filter consisting of well-graded gravel, crushed stone, or fabric is installed to prevent undercutting of the riprap;

C. when site conditions warrant, the toe end of the riprap is installed in a trench excavated into the bed of the public water to anchor the riprap from ice and wave action, with all excavated materials either used to back fill behind the riprap or removed from the bed of the public water;

D. the encroachment into the water is the minimum amount necessary to provide protection and does not unduly interfere with the flow of water; and

E. adequate engineering studies are done to certify the adequacy of the design of the riprap project, if deemed necessary by the area hydrologist.

Subp. 3. **Bioengineering projects.** The grading or filling of materials below the ordinary high water level to facilitate the installation or use of willow wattles, willow posts, brush mattressing, brush layering, fiber roll breakwaters, plant carpets, root wads, and other natural materials for erosion protection and shoreline zone restoration purposes shall be approved if:

A. the methods and materials used are designed in consultation with department or local government staff experienced in the use of such materials;

B. excavation and fill placement needed in conjunction with bioengineering projects are minimized and are subject to all requirements related to fill and excavation in parts 6115.0190, 6115.0191, 6115.0200, and 6115.0201; and

C. a separate aquatic plant management permit is obtained whenever the project involves planting aquatic plants other than willow and dogwood.

Subp. 4. **Structural erosion control projects.** Installation of rock gabions, A-jacks, cable concrete, bendway weirs, interlocking concrete blocks, eddy rocks, deflectors, gravel riffles, or other structural methods of erosion control or bank stabilization shall be approved if:

A. adequate engineering studies are performed to determine the suitability for use of any of these types of erosion control projects, as determined by the department;

B. the project is not an aesthetic intrusion upon the area and is consistent with all applicable local, state, and federal management plans, programs, and ordinances relating to the affected waterbody;

C. encroachment below the ordinary high water level is limited to the minimum necessary for the construction project;

D. when the project involves the removal of aquatic plants, a separate aquatic plant management permit is obtained;

E. the project does not adversely impact native plants, trees, or animals; and

F. any retaining wall complies with requirements for structures under parts 6115.0210 and 6115.0211.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

Subp. 5. **Wave breaks.** Grading, filling, or excavation to install rock, silt fence, or any other material or device designed solely for the purpose of protecting native aquatic plants from wave or current action during their establishment shall be approved if:

A. the materials do not obstruct navigation or the flow of water;

B. the project is done in conjunction with an issued aquatic plant management permit; and

C. temporary (less than two years) wave breaks are preferred over permanent structures, which must also meet the requirements of parts 6115.0210 and 6115.0211.

Subp. 6. **Other erosion control projects.** Using a structure, material, fill, excavation, or other technique that is not covered under subparts 2 to 5 and that is designed primarily to control erosion of the shoreline zone or to restore the shoreline zone to a more natural condition or altering the shoreline zone in any way that is not covered by specific regulations shall be approved if:

A. the intended purpose of the project is reasonable with respect to all other alternatives;

B. any method of erosion control that is not widely accepted as being effective is used only as a temporary or experimental project, provided that the project sponsor must totally repair the shoreline zone if the project proves to be unsuccessful within five years. A public entity must be a cosponsor of the temporary or experimental project and accept responsibility for maintenance, repair, and removal of the project;

C. the project complies with all other federal, state, and local regulations and ordinances; and

D. the project adequately protects public safety and promotes the public welfare.

Subp. 7. **Contaminated site restoration projects.** Restoration of a site contaminated with materials or water determined to be hazardous or toxic through a publicly funded study or site cleanup process shall be approved if:

A. the study includes a discussion of alternative approaches to restore the contaminated site; and

B. the commissioner, in consultation with the Minnesota Pollution Control Agency, participated in either the development of the site restoration plan or study and concurs with the site restoration plan or study recommendations or participated in the development of the site restoration funding initiative and concurs with the funded initiative.

6115.0217 APPLICATION OF OTHER STANDARDS; RESTORATION.

Unless otherwise specified in other parts, parts 6115.0215 and 6115.0216 apply to projects proposed as part of any other activity or activities including, but not limited to:

A. filling, parts 6115.0190 to 6115.0192;

B. excavations, parts 6115.0200 to 6115.0202;

C. structures, parts 6115.0210 to 6115.0212;

D. water level controls, parts 6115.0220 to 6115.0222;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

E. bridges and culverts, parts 6115.0230 to 6115.0232;

F. drainage of public waters, parts 6115.0270 to 6115.0272; and

G. alterations of public waters for mining, part 6115.0280.

6115.0220 WATER LEVEL CONTROLS.

Subpart 1. **Goals.** It is the goal of the department to manage public waters to:

A. maintain or restore natural flow and natural water level conditions to the maximum feasible extent;

B. encourage the construction of small off-channel retarding structures for the conservation of water in altered, natural waterbasins, consistent with any overall plans for the affected watershed area; and

C. limit the artificial manipulation of water levels, except when the balance of affected public interests clearly warrants the establishment of appropriate controls and it is not proposed solely to satisfy private interests.

Subp. 2. **Scope.** The construction, repair, reconstruction, or abandonment of any structure intended to impound, divert, or control the level or flow of public waters is subject to the provisions of this part.

Subp. 3. **Prohibited water level control facilities.** Construction or reconstruction of water level control facilities is prohibited when it is intended to manipulate water levels solely to satisfy private interests.

Subp. 4. **No permit required.** No permit is required to construct, reconstruct, or abandon a water level control structure on public watercourses with a contributing watershed of 300 acres or less, except on officially designated trout streams, provided the structure does not qualify as a dam under the rules for dam safety.

Subp. 5. **Permits required.** Permits are required for the construction, repair, reconstruction, or abandonment of any water level control structure, except as provided in subparts 3 and 4, and a project must meet the following general criteria:

A. the project will involve a minimum of encroachment, change, or damage to the environment, including but not limited to fish and wildlife habitat, navigation, water supply, storm water retention, and agricultural uses;

B. adverse effects on the physical or biological character of the waters are subject to feasible and practical measures to mitigate the effects;

C. the proposed project is consistent with applicable floodplain, shoreland, and wild and scenic rivers management standards and ordinances for the waters involved;

D. the proposed project is consistent with water and related land management plans and programs of local and regional governments, provided such plans and programs are consistent with state plans and programs;

E. the construction or reconstruction complies with parts 6115.0300 to 6115.0520 with respect to dam safety for the protection of human life and property;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

F. the construction or reconstruction of water level control structures or changing the level of an existing structure shall be approved only to:

(1) control and store flood waters;

(2) maintain low flows for instream flow or water level protection;

(3) manage water quality, including the prevention or control of erosion and sedimentation;

(4) improve water-based recreation;

(5) create, improve, and maintain water supplies;

(6) create, improve, or maintain aquatic habitat for fish and wildlife species;

(7) establish, improve, or maintain the generation of hydroelectric power; or

(8) restore the existing control elevation to a historic natural water elevation if detailed engineering surveys establish that the proposed control elevation does not exceed the estimated natural control elevation; and

G. the construction or reconstruction of water level control structures or changing the level of an existing structure on watercourses shall be approved only to:

(1) control and store flood waters;

(2) improve water-based recreation;

(3) create, improve, and maintain water supplies;

(4) establish, improve, or maintain the generation of hydroelectric power; or

(5) create, improve, or maintain aquatic habitat for fish and wildlife species.

Statutory Authority: *MS s 103G.315; 105.415*

History: *8 SR 533; 25 SR 143; 27 SR 529*

6115.0221 SPECIFIC STANDARDS; WATER LEVEL CONTROLS.

Subpart 1. **Specific requirements.** In addition to the general standards in part 6115.0220, subparts 2 to 5, specific requirements for water level control structures shall be met according to this part.

Subp. 2. **Permanent lake level control facilities.**

A. Permanent lake level control facilities shall be approved when the commissioner initiates proceedings for the purpose of conserving or utilizing the water resources of the state and assumes responsibility for operation and future maintenance, or when all of the following conditions are met:

(1) the ordinary high water level and runout elevation of the water body have been determined by a detailed engineering survey, or by order of the commissioner following a public hearing;

(2) the proposed facilities are "reasonably consistent with natural conditions:"

(a) where a functioning outlet existed in a state of nature or for a long period of time following lawful creation or alteration of an outlet by the activities of people or animals, or cataclysmic events, the proposed outlet is at essentially the same control elevation;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(b) where no natural or artificial outlet exists and the lake is for all practical purposes "landlocked," the control elevation shall not be more than 1-1/2 feet below the ordinary high water level, unless the commissioner finds that:

i. the control is necessary to prevent adverse impacts to the lake or adjoining property;

ii. other reasonable or cost-effective alternatives are not available;

iii. natural resource or hydrologic conditions exist in the watershed that would limit the potential for continuous discharge of excess waters from the lake; and

iv. the outlet and discharge of excess waters is addressed in an approved water management plan under Minnesota Statutes, chapter 103B or 103D; and

(c) the commissioner may issue a permit to restore the existing control elevation to a historic natural water elevation if detailed engineering surveys establish that the proposed control elevation does not exceed the estimated natural control elevation;

(3) the project is sponsored by a governmental unit, which assumes responsibility for operation and future maintenance, except when:

(a) the majority of the riparian owners sign the permit application;

(b) appropriate easements or other property interests have been obtained from all affected owners;

(c) a title-registration type permit is issued to the owner or owners of the property upon which the proposed water level control structure will be located; and

(d) the structure will further public interests in navigation, propagation of fish or wildlife, or other beneficial public uses of the water;

(4) justification has been made of the need in terms of public and private interests and the available alternatives, including the impact on receiving waters and public uses thereof, through a detailed hydrologic study; and

(5) a detailed plan is developed for operation and control including:

(a) manner and time of operation;

(b) frequency of maintenance;

(c) appropriate monitoring of water levels, water quality, and other factors; and

(d) management of excess waters.

B. In addition to the requirements of item A, subitem (2), unit (b), if the proposed control elevation is more than 1-1/2 feet below the ordinary high water level, the permit applicant must serve a copy of the application on each county and municipality within which any portion of the lake is located and the lake improvement district, if one exists. The commissioner must not issue a permit to establish a control elevation more than 1-1/2 feet below the ordinary high water level of a lake if a county, municipality, watershed district, or lake improvement district required to be served under this item or Minnesota Statutes, section 103G.301, subdivision 6, files a written objection to the issuance of the permit with the commissioner within 30 days after receiving a copy of the application.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

Subp. 3. **Fish and wildlife management.** Fish and wildlife management proposals made pursuant to Minnesota Statutes, section 97A.101, or other appropriate authority shall be approved when:

A. the public water has been designated for wildlife management purposes;

B. there is a specific water level management plan for the lake basin;

C. any drawdown of the lake is only temporary and the management plans include a permanent facility for restoration of water levels following such drawdowns;

D. any alteration of a watercourse included in the plan follows the requirements specified in part 6115.0201, subpart 7;

E. appropriate easements or fee title is obtained; and

F. specified management personnel are required to establish a lake level gauge and keep a record of water levels with a specified frequency during seasons of active water level manipulation and with a lesser frequency during all other open water seasons.

Subp. 4. **Certain landlocked waterbasins.** Plans for landlocked waterbasins less than 25 acres in surface area and contained completely within the municipal boundaries of a single city shall be approved when:

A. a municipal drainage plan for the affected tributary watershed is prepared by a qualified engineer or hydrologist and is approved by the affected watershed district and the city;

B. the city has a field survey made of the waterbasin after consultation with the department, including but not limited to:

(1) the elevation of the aquatic vegetation fringe;

(2) the elevation of the tree line and a description of the location, type, and size of representative trees;

(3) groundwater elevations, if appropriate; and

(4) other information as requested by the department;

C. control elevations and associated physical parameters are approved by the department and the city; and

D. the city holds a public hearing on the proposal and provides a transcript of the proceedings to the department. Provision of a transcript may be waived by the department.

Subp. 5. **Other controls.** Permits for the construction, reconstruction, and abandonment of water level control structures not covered under subparts 2 to 4 shall be issued if:

A. the need is established in terms of quantifiable benefits;

B. the structural design is done by a professional engineer or by a qualified engineer of the Natural Resources Conservation Service or the Corps of Engineers and includes the following considerations:

(1) gravity forces;

(2) hydrostatic pressure;

(3) uplift forces;

(4) overturning moment;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(5) resistance to sliding;

(6) ice pressures;

(7) earthquake forces;

(8) slope stability, including consolidation and pore pressures;

(9) seepage collection or prevention;

(10) foundation conditions, including appropriate borings and determination of the strength of foundation materials;

(11) specifications for materials of construction and their placement or installation;

(12) adequate construction inspection to assure conformance with design assumptions; and

(13) adequacy of the cofferdam or diversion during construction, if any; and

C. adequate assurances are made for future maintenance of new water level control structures:

(1) for water level control structures 25 feet or more in structural height or having a maximum storage capacity of 50 acre-feet or more, permits shall be issued only to governmental agencies, public utilities, or corporations having authority to construct and maintain such projects, except that a title-registration type permit may be issued to the owner or owners of the private property upon which the proposed water level control structure will be located when the provisions of subpart 2, item A, subitem (3), are met;

(2) for other water level control structures, title-registration type permits shall be issued to the owner or owners of the private property upon which the water level control structure will be located if the permit runs with the land and requires breaching or removal if the structure ever falls into a state of disrepair or becomes unsafe; and

(3) periodic engineering inspections of authorized water level control structures may be made by the department or its designee.

6115.0230 BRIDGES AND CULVERTS, INTAKES AND OUTFALLS.

Subpart 1. **Goals.** It is the goal of the department to allow crossings of public waters, including the construction of water intake and sewer outfall structures in public waters, only when less detrimental alternatives are unavailable or unreasonable, and where such facilities adequately protect public health, safety, and welfare.

Subp. 2. **Scope.** The construction or reconstruction of any bridge, culvert, intake, outfall, or other crossing of public waters is subject to this part. Abandonment or removal of all crossings and structures governed by this part requires a permit according to part 6115.0211, subpart 8.

Subp. 3. **Prohibited crossings.** Crossings are prohibited when the project:

A. will obstruct navigation or create a water safety hazard;

B. will cause or contribute to significant increases in flood elevations and flood damages either upstream or downstream;

C. involves extensive channelization above and beyond minor stream channel realignments to improve hydraulic entrance or exit conditions, except when a separate permit is obtained according to part 6115.0201, subpart 7;

D. will be detrimental to water quality or significant fish and wildlife habitat;

E. will take threatened or endangered species listed in chapter 6134 without authorization by the commissioner according to parts 6212.1800 to 6212.2300; or

F. will provide private access to an island.

Subp. 4. **No permit required.** No permit is required to construct the following types of crossings on public waters, unless prohibited in subpart 3:

A. to construct or reconstruct a bridge or culvert on a public watercourse with a total drainage area, at its mouth, of five square miles or less, except on officially designated trout streams;

B. to construct or reconstruct a low-water ford type crossing, if:

(1) the stream bed is capable of supporting the crossing without the use of pilings, culverts, dredging, or other special site preparation;

(2) the water depth does not exceed two feet under normal summer flow conditions;

(3) the crossing conforms to the natural cross-section of the stream channel and does not reduce or restrict normal low-water flows;

(4) the original stream bank at the site does not exceed four feet in height;

(5) the crossing is constructed of gravel, natural rock, concrete, steel matting, or other durable inorganic material not exceeding one foot in thickness;

(6) the approach is graded to a finished slope not steeper than 5:1 horizontal:vertical, and all graded banks are seeded or mulched to prevent erosion and sedimentation; and

(7) the crossing is not placed on an officially designated trout stream, on a wild, scenic, or recreational river, or on an officially designated state water trail;

C. to construct or reconstruct a temporary bridge, if:

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(1) the stream bank is capable of supporting the bridge without the use of foundations, pilings, culverts, excavation, or other special site preparation;

(2) nothing is placed in the bed of the stream;

(3) the bridge is designed and constructed so that it can be removed for maintenance and flood damage prevention;

(4) the bridge is firmly anchored at one end and so constructed as to swing away to allow flood waters to pass;

(5) the lowest portion of the bridge is at least three feet above the ordinary high water level on navigable streams; and

(6) the bridge is consistent with state and local rules and regulations for floodplain, shoreland, and wild, scenic, or recreational rivers management standards and ordinances;

D. to maintain the hydraulic adequacy of any storm sewer or agricultural drain tile outfall or ditch that has been functioning within the previous five years, if such work does not alter the original course, current, or cross-section of the public waters; or

E. to install an agricultural drain tile outletting into public waters, if the bank is restored to the original cross-section or contour and no permanent structure is placed below the ordinary high water level, except for the drain tile.

Subp. 5. **Permits required.** Permits are required for the construction or reconstruction of any bridge, culvert, intake, outfall, or other crossing of public waters, except as provided in subparts 3 and 4, and a project must meet the following general criteria:

A. the project must not exceed more than a minimum encroachment, change, or damage to the environment, particularly the ecology of the waters;

B. adverse effects on the physical or biological character of the waters are subject to feasible and practical measures to mitigate the effects;

C. the proposed crossing is consistent with applicable floodplain, shoreland, and wild and scenic rivers management standards and ordinances for the waters involved;

D. the proposed crossing is consistent with water and related land management plans and programs of local and regional governments, provided such plans and programs are consistent with state plans and programs; and

E. crossings of public waterbasins or public water wetlands are allowed only when there is no feasible and practical alternative that does not require filling, excavating, or the placement of a structure in public waters.

6115.0231 SPECIFIC STANDARDS; BRIDGES, CULVERTS, INTAKES, AND OUTFALLS.

Subpart 1. **Specific requirements.** In addition to the general standards in part 6115.0230, subparts 2 to 5, specific requirements for bridges, culverts, intakes, outfalls, and other crossings of public waters shall be met according to this part.

Subp. 2. **Bridges, culverts, and other crossings.** The construction, reconstruction, or relocation of all bridges, culverts, or other crossings over public waters shall be approved if all of the following criteria are met:

A. the hydraulic capacity of the structure is established by a competent technical study. The sizing shall not be based solely on the size of existing upstream and downstream structures. If a state or federal floodplain information study exists for the area, or a United States Geological Survey gaging station is located nearby on the stream, the hydraulics of the proposed bridge/culvert design must be consistent with these data. The department may waive this requirement if:

(1) the department has performed a hydraulic study based upon available information and reasonable assumptions;

(2) the department has made a field investigation of the project site; and

(3) the project will not cause flood-related damages or problems for upstream or downstream interests;

B. new crossings and replacements of existing crossings comply with local floodplain management ordinances, with provisions of part 6120.5700, subpart 4, item A, and with the following:

(1) for new crossings, no approach fill for a crossing shall encroach upon a community designated floodway. When a floodway has not been designated or when a floodplain management ordinance has not been adopted, increases in flood stage in the regional flood of up to one-half of one foot shall be approved if they will not materially increase flood damage potential. Additional increases may be permitted if: a field investigation and other available data indicate that no significant increase in flood damage potential would occur upstream or downstream, and any increases in flood stage are reflected in the floodplain boundaries and flood protection elevation adopted in the local floodplain management ordinance;

(2) for replacement of existing crossings, if the existing crossing has a swellhead of one-half of one foot or less for the regional flood, the replacement crossing shall comply with the provisions for new crossings in subitem (1). If the existing crossing has a swellhead of more than one-half of one foot for the regional flood, stage increases up to the existing swellhead shall be allowed if field investigation and other available data indicate that no significant flood damage potential exists upstream from the crossing based on analysis of data submitted by the applicant. The swellhead for the replacement crossing may exceed the existing swellhead if it complies with the provisions for new crossings found in subitem (1); and

(3) the decks and approaches to bridges or culverts on major transportation routes and on roads that provide access to development at urban densities shall be no lower than two feet below the flood protection elevation as defined in part 6120.5700, subpart 5, unless it can be shown that alternative routes or access can be provided during the regional flood;

C. the structure provides for game fish movement, unless the structure is intended to impede rough fish movement or the stream has negligible fisheries value;

D. the structure will not obstruct reasonable public navigation. For bridges over public watercourses, three feet above the calculated 50-year flood stage ordinarily satisfies navigational clearance

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

requirements. For bridges over public waterbasins or public water wetlands, and all culverts, three feet of clearance above the ordinary high water level ordinarily satisfies navigational requirements;

E. any project proposed near an existing or proposed segment of the state trails system should be consistent therewith; and

F. bridges and walkways to islands comply with the following:

(1) bridges and walkways over watercourses to islands must be designed to cause negligible backwater effects during floods and must be securely anchored or otherwise capable of withstanding the dynamic forces of flowing water, ice, and debris; and

(2) permits for reconstruction of existing bridges or walkways over public waterbasins and public water wetlands to islands that are intended to provide public access shall be issued only if the existing crossing provides the only existing land access to the island, there is existing development on the island, and the design provides for any public navigational needs and is consistent with the natural surroundings.

Subp. 3. **Intakes and outfalls.** The construction, reconstruction, or relocation of all water intake and sewer outfall structures placed in public waters shall be approved if all of the following criteria are met:

A. adequate attention is given to methods of screening the structure from view as much as possible from the surface of the public water through the use of existing vegetation or new plantings;

B. the project is not detrimental to public values, including but not limited to fish and wildlife habitat, navigation, water supply, water quality, or storm water retention;

C. no site conditions will require frequent future disruption of the beds of public waters;

D. adequate precautions are planned during and after construction to prevent silt, soil, and other suspended particles from being discharged into public waters;

E. adjacent to the intake structure, the banks and bed of the public water are protected from erosion and scour by placement of suitable riprap shore protection;

F. the banks are revegetated by seeding and/or sodding;

G. the structure is designed by a professional engineer;

H. for intake structures, excavation is detailed in the application and on design plans. When necessary, a water appropriation permit must be obtained from the department prior to operation of the intake structure. An appropriate sized screen must be used to prevent fish intake; and

I. outfall structure design:

(1) when necessary, incorporates a stilling-basin, surge-basin, energy dissipator, or other device or devices to minimize disturbance and erosion of natural shoreline and bed resulting from peak flows;

(2) when feasible, utilizes discharge to stormwater treatment ponds, artificial stilling or sedimentation basins, or other devices for entrapment of floating trash and litter, sand, silt, debris, and organic matter prior to discharge to public waters; and

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(3) when feasible, maximizes use of natural or artificial ponding areas to provide water retention and storage for the reduction of peak flows into public waters.

6115.0240 APPLICATION FOR PUBLIC WATERS WORK PERMITS.

Subpart 1. **Forms and submission.** All applications pursuant to parts 6115.0150 to 6115.0280 shall be made on forms prepared by the department and submitted to the regional office for the area where the majority of the proposed project is located.

Subp. 2. **Who may apply.** Applications shall be submitted by the riparian owner of the land on which a project is proposed, except:

A. a governmental agency, public utility, or corporation authorized by law to conduct the project may apply if the property rights acquired or to be acquired are fully described in the application;

B. a holder of appropriate property rights such as a lease or easement may apply if the application is countersigned by the owner and accompanied by a copy of the lease or other agreement. A permit shall be issued for the term of the lease only, subject to cancellation prior to the termination date of the agreement if the agreement is canceled; and

C. a prospective lessee of state-owned lands may apply for a permit in the applicant's own name after requesting a lease from the departmental official responsible for the affected lands. Both the lease request and the permit application shall be processed concurrently with appropriate coordination.

Subp. 3. **Information required.** Pursuant to Minnesota Statutes, section 103G.305, an application is complete when:

A. it includes all of the information specified in parts 6115.0150 to 6115.0280;

B. it is accompanied by appropriate photographs, maps, sketches, drawings, or other plans that adequately describe the proposed project;

C. it includes a brief statement regarding the following points:

(1) anticipated changes in water and related land resources;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(2) unavoidable anticipated detrimental effects on the natural environment;

(3) alternatives to the proposed action;

(4) that the proposed project is reasonable and practical and will adequately protect public safety and promote the public welfare; and

(5) a demonstration by the applicant that the proposed activity authorized by part 6115.0190, subpart 5; 6115.0200, subpart 5; 6115.0210, subpart 5; 6115.0215, subpart 5; 6115.0220, subpart 5; 6115.0230, subpart 5; 6115.0270, subpart 4; or 6115.0280, subpart 4, complies with all the following principles in descending order of priority:

(a) avoids direct or indirect impacts to public waters that may destroy or diminish the public waters;

(b) minimizes the impact to the public water by limiting the degree or magnitude of the public water activity and its implementation;

(c) rectifies the impact by repairing, rehabilitating, or restoring the affected public water;

(d) reduces or eliminates the impact to the public water over time by preservation and maintenance operations; and

(e) for a major change in the public waters, replaces unavoidable impacts to the public water by restoring degraded or impacted public waters having equal or greater public value or, if public waters restoration opportunities are not reasonably available, creating and protecting additional replacement water areas having greater public value;

D. application fees are paid. Final permits shall not be issued until any field inspection fees are paid; and

E. proof of service of a copy of the application and accompanying documents on the mayor of the city or the secretary of the board of the district is included with the application if the project is within or affects a city, watershed district, or soil and water conservation district.

Subp. 4. **Fees.** All applications shall be accompanied by an application fee as required by part 6115.0060. An additional fee may be charged for field inspections conducted by department personnel in the course of review subject to the provisions of part 6115.0080.

Statutory Authority: *MS s 103G.315; 105.415*

6115.0250 PERMIT REVIEW.

Subpart 1. **Field inspection.** The department may conduct field investigations to determine a project's nature, scope, and impact on water and related land resources. The department shall determine which applications must be investigated and such inspections shall be made in a timely fashion.

Subp. 1a. **Effect on environment and mitigation.** The commissioner may not issue a permit that causes pollution, impairment, or destruction of the air, water, land, or other natural resources so long as there is a feasible and prudent alternative consistent with the reasonable requirements of the public health, safety, and welfare. If the commissioner determines that a major change in public waters is justified and

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

can be authorized by parts 6115.0190, subpart 5; 6115.0200, subpart 5; 6115.0210, subpart 5; 6115.0215, subpart 5; 6115.0220, subpart 5; 6115.0230, subpart 5; 6115.0270, subpart 4; or 6115.0280, subpart 4, the permit must include provisions to compensate for the detrimental aspects of the change. Compensation for the identified detrimental aspects of the permitted project include:

A. restoring degraded or impacted public waters having equal or greater public value;

B. creating or restoring additional replacement water areas having equal or greater public value; or

C. any other measures approved by the commissioner that compensates for the detrimental aspects of the change.

Subp. 2. **Coordination with other agencies.** Nothing in these standards is intended to supersede or rescind the laws, rules, regulations, standards, and criteria of other federal, state, regional, or local governmental subdivisions with the authority to regulate work in the beds or on the shorelands of public waters. The issuance of a permit shall not confer upon an applicant the approval of any other unit of government for the proposed project. The department shall coordinate the review with other units of government having jurisdiction in such matters.

Subp. 3. **Procedure upon decision.** The commissioner may grant permits, with or without conditions, or deny them. In all cases, the applicant, the managers of the watershed district, the board of supervisors of the soil and water conservation district, or the mayor of the city may demand a hearing in the manner specified in Minnesota Statutes, section 103G.311, within 30 days after receiving mailed notice outlining the reasons for denying or modifying an application. Any hearing shall be conducted as a contested case hearing before an administrative law judge from the independent Office of Administrative Hearings according to Minnesota Statutes, chapter 14 and section 103G.311.

Subp. 4. **General permits.** The commissioner is authorized to issue general permits to a governmental subdivision or to the general public for classes of activities having minimal impact on public waters under which more than one activity may be conducted with a single permit.

Subp. 5. **Public water wetland permit processing.**

A. Public waters work permit applications submitted to the commissioner for proposed projects in public water wetlands shall be granted if authorized by parts 6115.0190 to 6115.0232 or parts 6115.0270 to 6115.0280 and if the public water wetland is:

(1) assigned a shoreland classification;

(2) classified as lacustrine wetland or deepwater habitats according to the document under item C; or

(3) where the state or federal government has become titleholder to any of the beds or shores of the public water wetlands, subsequent to the preparation of the public waters inventory maps on file with the auditor of the county and where the responsible state or federal agency declares that the water is necessary for purposes of public ownership.

B. All other public waters work permit applications for proposed projects in public water wetlands shall be:

(1) granted, with or without conditions, if authorized by parts 6115.0190 to 6115.0232 or 6115.0270 to 6115.0280 and if the permit application complies with provisions for sequencing under part

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

8420.0520, and replacement provisions under parts 8420.0522 to 8420.0544, 8420.0810, and 8420.0820, or denied; or

(2) waived pursuant to item D.

C. The following documents are incorporated by reference:

(1) Classification of Wetlands and Deepwater Habitats of the United States, Lewis M. Cowardin et al., United States Department of the Interior, Fish and Wildlife Service (1979); and

(2) Guidelines for Ordinary High Water Level (OHWL) Determinations, John Scherek and Glen Yakel, Minnesota Department of Natural Resources, Division of Waters (June 1993).

These documents are available through the Minitex interlibrary loan system and are not subject to frequent change.

D. Public waters work permits in public water wetlands:

(1) notwithstanding parts 6115.0150 to 6115.0280, the authority of the commissioner to require a permit for activities within public water wetlands is waived to the local unit of government under chapter 8420 when the commissioner has received notice or application from the landowner or project sponsor and when the commissioner has provided the applicant or project sponsor and the local unit of government a notice within 15 days of receipt of the notice or permit application that the department will waive public waters work permit jurisdiction to the local unit of government; or

(2) the commissioner shall not waive the requirement for a public waters work permit in a public water wetland for activities:

(a) allowed under part 8420.0122, subparts 1 to 7 and 10;

(b) in public water wetlands assigned a shoreland classification;

(c) in public water wetlands classified as lacustrine wetland or deepwater habitats according to the document under item C; or

(d) in public water wetlands where the state or federal government has become titleholder to any of the beds or shores of the public water wetlands, subsequent to the preparation of the public waters inventory maps on file with the auditor of the county and where the responsible state or federal agency declares that the water is necessary for purposes of public ownership.

E. Notwithstanding parts 6115.0150 to 6115.0280, the authority of the commissioner to require a permit for public road activities that are associated with the repair, rehabilitation, reconstruction, or replacement of currently serviceable existing public roads is waived to the public road authority under chapter 8420:

(1) for projects that affect less than 10,000 square feet of public water wetlands, upon receipt of a copy of the state, city, county, or town public road authority report that is submitted to the Board of Water and Soil Resources in compliance with part 8420.0544, item D, except for projects in public water wetlands:

(a) assigned a shoreland classification;

(b) classified as lacustrine wetland or deepwater habitats according to the document under item C, subitem (1); or

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(c) when the state or federal government has become titleholder to any of the beds or shores of the public water wetlands, subsequent to the preparation of the public waters inventory maps on file with the auditor of the county and when the responsible state or federal agency declares that the water is necessary for purposes of public ownership; or

(2) for projects that affect 10,000 square feet or more of public water wetlands, when the commissioner has provided the public road authority notice of the waiver within 15 days of receipt of a copy of the state, city, county, or town public road authority report that is submitted to the Board of Water and Soil Resources in compliance with part 8420.0544, item D, except for projects in public water wetlands:

(a) assigned a shoreland classification;

(b) classified as lacustrine wetlands or deepwater habitats according to the document under item C, subitem (1); or

(c) when the state or federal government has become titleholder to any of the beds or shores of the public water wetlands, subsequent to the preparation of the public waters inventory maps on file with the auditor of the county and when the responsible state or federal agency declares that the water is necessary for purposes of public ownership.

Subp. 6. **Wetland areas of public waters affected by public road permit projects.**

A. For purposes of this subpart, "wetland areas of public waters" means areas that are contiguous with the ordinary high water level and that generally exhibit emergent vegetation within:

(1) public waterbasins;

(2) public water wetlands assigned a shoreland classification;

(3) public water wetlands classified as lacustrine wetlands or deepwater habitats according to the document under item C; or

(4) public water wetlands where the state or federal government has become titleholder to any of the beds or shores of the public water wetlands subsequent to the preparation of the public water inventory maps on file with the auditor of the county and where the responsible state or federal agency declares that the water is necessary for purposes of public ownership.

B. Public waters work permit applications submitted by a public road authority to the commissioner for proposed projects in wetland areas of public waters shall be granted if authorized by parts 6115.0190 to 6115.0232 or 6115.0270 to 6115.0280.

C. The classification of lacustrine wetlands and deepwater habitats found in Classification of Wetlands and Deepwater Habitats of the United States, Lewis M. Cowardin et al., United States Department of the Interior, Fish and Wildlife Service (1979) is incorporated by reference. This document is available through the Minitex interlibrary loan system and is not subject to frequent change.

D. Notwithstanding parts 6115.0150 to 6115.0280, the authority of the commissioner to require a permit for public road activities in, on, or over wetland areas of public waters according to the document under item C is waived for:

(1) all activities authorized by the local government unit under chapter 8420 when the commissioner has received notice or application from the public road authority and when the commissioner has notified the public road authority and the local unit of government of the waiver within 15 working days of receipt of the notice or application; or

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(2) activities authorized by the public road authority having jurisdiction under chapter 8420 for public road activities that are associated with the repair, rehabilitation, reconstruction, or replacement of currently serviceable existing public roads when the commissioner has notified the public road authority of the waiver within 15 working days of receipt of a copy of the state, city, county, or town public road authority report that is submitted to the Board of Water and Soil Resources in compliance with part 8420.0544, item D.

Subp. 7. **Written agreements with local government units.**

A. For projects affecting both public waters and wetlands, the local government may, by written agreement with the commissioner, waive the requirement for a replacement plan or a no-loss or exemption determination if a public waters work permit is required and the commissioner includes provisions of Minnesota Statutes, sections 103A.201, 103B.3355, 103G.222, and 103G.2372, and rules adopted thereunder, in the public waters work permit.

B. The written agreement may be done on a project-by-project basis when:

(1) the agreement identifies the parties having authority to make the agreement and the proposed project subject to the agreement;

(2) the commissioner requires an individual public waters work permit for the proposed project;

(3) the majority of the proposed project impacts on public waters and wetlands are to public waters;

(4) the proposed wetland impacts are subject to approval of a wetland replacement plan or a no-loss or exemption determination by the local unit of government according to part 8420.0210, 8420.0220, or 8420.0230;

(5) the local government unit provides the commissioner with specific language addressing no-loss or exemption determinations or allowable wetland impacts and required wetland replacement for incorporation into the commissioner's public waters work permit; and

(6) the local government unit agrees to assist the commissioner should appeals be brought against the commissioner based on the language impacting the wetlands covered in the public waters work permit.

C. The written agreement may be done on a local unit of government basis, a watershed basis, a waterbody basis, or a project activity basis when:

(1) the written agreement identifies the parties having authority to enter into the agreement, the location of agreement application, and the scope of proposed activities subject to the agreement;

(2) the commissioner requires an individual public waters work permit for the proposed project;

(3) the majority of the proposed project impacts to public waters and wetlands are to public waters;

(4) the wetland impacts are subject to approval of a wetland replacement plan or a no-loss or exemption determination by the local unit of government according to part 8420.0210, 8420.0220, or 8420.0230;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(5) the local government unit provides the commissioner with specific language addressing no-loss or exemption determinations or allowable wetland impacts and required wetland replacement for incorporation into the commissioner's public waters work permit;

(6) the local government unit agrees to assist the commissioner should appeals be brought against the commissioner based on the language impacting the wetlands covered in the public waters work permit; and

(7) the agreement addresses enforcement procedures and procedures for the commissioner or the local government unit to terminate the written agreement.

Subp. 8. **Local plan implementation.** Notwithstanding parts 6115.0150 to 6115.0280, the commissioner may authorize alternative regulation of public waters activities that are specifically identified in a local plan, ordinance, or other similar written document approved by the commissioner and subject to the following:

A. the proposed activities are subject to the following principles in descending order of priority:

(1) avoid direct or indirect impacts to the public water that may destroy or diminish the public water;

(2) minimize the impact to the public water by limiting the degree or magnitude of the public water activity;

(3) rectify the impact by repairing, rehabilitating, or restoring the affected public water;

(4) reduce or eliminate the impact to the public water over time by preservation and maintenance operations; and

(5) replace unavoidable impacts to the public water when a major change in the resource is justified, by including provisions to compensate for the detrimental aspects of the change according to subpart 1a;

B. the proposed activities, their dimensional standards, the criteria used to issue or deny applications, and allowable locations are identified in the local plan;

C. adverse effects of the proposed activity on the physical and biological character of the area are subject to mitigation measures identified in the local plan;

D. the proposed activities are consistent with locally adopted controls;

E. the plan addresses enforcement procedures;

F. the plan includes procedures for the commissioner to reassume the permit authorities in parts 6115.0150 to 6115.0280 upon notice, if determined necessary by the commissioner or plan sponsor;

G. the local plan sponsor publishes a notice in the State Register identifying:

(1) the local plan sponsor that is developing an alternative plan for regulation of public waters;

(2) the scope of activities and the location of the public waters impacted by the plan;

(3) the groups the local plan sponsor has been working with in the development of the plan;

(4) the name and address of the local plan sponsor who can be contacted for copies of the plan, and the name and address of the plan contact for the department; and

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(5) a statement that the interested public has a time period of no less than 30 days in which to forward comments to the plan sponsor and the department plan contact for consideration before the plan sponsor submits the draft plan to the commissioner for approval;

H. when considering whether the plan should be approved, the commissioner shall determine that:

(1) the proposed plan, when not in conformity to parts 6115.0150 to 6115.0280, provides an explanation of how the proposed changes are justified;

(2) the public values provided by public waters subject to the plan are maintained or improved; and

(3) the proposed plan provides a mechanism for a periodic review of the plan contents and a procedure to revise the plan, if determined necessary by the commissioner and plan sponsor, or to terminate the plan upon notice being provided by either the plan sponsor or commissioner; and

I. nothing in the review of local plans proposed under this part shall be construed as prohibiting or discouraging a local plan from creating standards that are more restrictive than parts 6115.0150 to 6115.0280.

6115.0255 PUBLIC WATERS ENFORCEMENT PROCEDURES.

Subpart 1. **Enforcement options.** Parts 6115.0150 to 6115.0280 may be enforced through one or any combination of the following authorities:

A. criminal proceedings under Minnesota Statutes, section 103G.141, subdivision 1;

B. orders of the commissioner under Minnesota Statutes, sections 103G.251 and 103G.315; and

C. cease and desist orders, restoration orders, and replacement orders under Minnesota Statutes, section 103G.2372.

The choice of enforcement authorities is dependent on the scope of the activity conducted without a public waters work permit.

Subp. 2. **Enforcement authorities.** The commissioner, conservation officers, and other peace officers may issue cease and desist orders and restoration and replacement orders according to Minnesota Statutes, section 103G.2372.

Subp. 3. **Cease and desist orders.**

A. Cease and desist orders may be issued when the enforcement authority has probable cause to believe that any activity is being or has been conducted in public waters without a valid permit from the commissioner.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

B. A cease and desist order must not be issued if a landowner has documentation of a valid public waters work permit from the commissioner authorizing the work that was done or if a landowner has documentation proving that no permit is required.

C. The cease and desist order shall direct a landowner to:

(1) stop all work, conduct no further work, and take immediate corrective action to stabilize the site from imminent erosion or restore water flow if ordered by the enforcement authority; and

(2) immediately submit a written project application form to the area hydrologist.

D. The enforcement authority issuing a cease and desist order shall promptly submit copies of the order to the commissioner.

E. The commissioner or agent shall review the evidence, including any evidence produced by a landowner, inspect the site if necessary, and determine:

(1) whether the area in question is a public water;

(2) whether a public waters work permit is required; and

(3) whether a public waters work permit application should be submitted or whether a restoration order or replacement order should be issued immediately, if it is determined that a public waters work permit application submitted in response to the cease and desist order would be denied in its entirety for being inconsistent with parts 6115.0150 to 6115.0280.

F. Pending a resolution of any criminal proceedings, if it is determined that the activity does not require a permit or if a permit is issued, the commissioner or agent shall request that the enforcement authority rescind the cease and desist order, pending the outcome of any decision that is appealed, and notify the soil and water conservation district, the commissioner, and the landowner. If the application is denied, the commissioner shall immediately notify the soil and water conservation district, the enforcement authority, and the landowner.

G. A cease and desist order must advise the landowner that violation of the order is a misdemeanor.

Subp. 4. **Restoration and replacement orders.**

A. If the commissioner or agent, with the concurrence of the enforcement authority, determines that restoration may not restore all the loss caused by the drain, excavate, structure, or fill activity, the enforcement authority may order restoration, a combination of restoration and replacement, or replacement rather than restoration.

B. The enforcement authority shall issue a restoration order or replacement order if:

(1) a cease and desist order has been issued and the landowner has not submitted a written project notification form to the area hydrologist within three weeks; or

(2) the commissioner has denied a permit application, determined that a permit application submitted for the activity subject to a cease and desist order would be denied in its entirety for being inconsistent with parts 6115.0150 to 6115.0280, or determined that some combination of restoration of the site and off-site restoration or replacement is necessary.

C. Promptly upon being informed of the need, the commissioner or agent shall inspect the site and prepare a plan for restoring the site. Restoration shall be ordered unless the commissioner or agent, with the concurrence of the enforcement authority, concludes that restoration would cause additional impairment

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

or further degradation of the public water. The commissioner or agent shall incorporate the restoration plan into a restoration order and send it to the enforcement authority for service in person or by certified mail to the landowner.

D. A restoration order must specify a date by which the landowner must restore the public waters according to the commissioner's plan and obtain a certificate of satisfactory restoration from the commissioner or agent.

E. A replacement order must specify a date by which the landowner must submit a replacement plan to the commissioner and a subsequent date by which the landowner must replace the public waters and obtain a certificate of satisfactory replacement from the commissioner or agent.

F. A restoration or replacement order must advise the landowner that violation of the order is a misdemeanor.

G. If, as part of a misdemeanor proceeding, the court orders restoration or replacement, the commissioner or agent, with the concurrence of the enforcement authority, shall determine which is appropriate, and if it is restoration, the method of restoration. If the court orders replacement, the landowner must follow the replacement plan ordered by the commissioner or agent.

H. If a landowner seeks approval of a public waters work permit after the proposed project has already impacted the public water, the commissioner may require the landowner to replace the impacted public water at a ratio not to exceed twice the replacement ratio otherwise required.

Subp. 5. **Appeals of replacement and restoration orders.**

A. A landowner may appeal the terms and conditions of a restoration or replacement order issued under subparts 2 to 4, to the commissioner, within 30 days of receipt of written notice by filing a written request for review. If the written request is not submitted within 30 days, the restoration or replacement order becomes final. The commissioner shall review the request and supporting evidence and render a decision within 60 days of the request for review.

B. If a landowner wishes to appeal the decision of the commissioner after review under item A, the landowner must file a written request within 30 days for a contested case hearing under Minnesota Statutes, chapter 14. The demand for hearing must be accompanied by a bond as required under Minnesota Statutes, section 103G.311, subdivision 6.

6115.0270 DRAINAGE OF PUBLIC WATERS.

Subpart 1. **Goals.** It is the goal of the department to protect and preserve public waterbasins and public water wetlands from damage or destruction by drainage.

Subp. 2. **Scope.** Parts 6115.0270 to 6115.0272 relate to the partial drainage or temporary drawdown of public waterbasins and public water wetlands for all purposes except mining of metallic or nonmetallic minerals which are subject to provisions of part 6115.0280.

Subp. 3. **Prohibited activity.** The permanent or total drainage of public waterbasins and public water wetlands is prohibited.

Subp. 4. **Permits required.** A permit is required for the partial drainage or temporary drawdown of public waterbasins and public water wetlands and shall be granted if all of the following conditions are met:

A. the proposed project is intended to achieve one or more of the following purposes:

(1) improve navigational or recreational uses;

(2) improve or restore fish or wildlife habitat;

(3) expose sediment in order to remove or eliminate nutrients or contaminants;

(4) alleviate flooding of agricultural lands caused by artificial obstruction of downstream drainage or increased upstream discharge; or

(5) allow the mining of iron ore, taconite, copper, copper-nickel, or nickel under Minnesota Statutes, section 103G.297;

B. the project will involve a minimum of encroachment, change, or damage to the environment, including but not limited to fish and wildlife habitat, navigation, water supply, water quality, and storm water retention;

C. adverse effects on the physical or biological character of the waters are subject to feasible and practical measures to mitigate the effects;

D. the proposed project is consistent with applicable floodplain, shoreland, and wild and scenic rivers management standards and ordinances for the waters involved; and

E. the proposed project is consistent with water and related land management plans and programs of local and regional governments, provided such plans and programs are consistent with state plans and programs.

6115.0271 SPECIFIC STANDARDS; DRAINAGE.

In addition to compliance with the general standards in part 6115.0270, subparts 2 to 4, specific requirements for drainage or drawdown activities shall be met as follows:

A. the drainage or diversion of public waters for mining iron ore, taconite, copper, copper-nickel, or nickel shall be approved only when all of the provisions of Minnesota Statutes, section 103G.297 and part 6115.0280 have been met;

B. the drainage or diversion of public waters for mining all other metallic and nonmetallic minerals shall be approved only when the public waters being drained are replaced by public waters that will have equal or greater public value, subject to provisions of part 6115.0280; and

C. all other drainage or diversion of public waters allowed in part 6115.0270, subparts 2 to 4, shall be approved if all of the following specific criteria are met:

(1) for public waterbasins and public water wetlands, permits shall be issued only to governmental agencies having the authority to undertake such projects. In addition, a public need for the partial drainage or temporary drawdown shall be established by specifying the public interests to be enhanced;

(2) written consent for the partial drainage or temporary drawdown of public waterbasins and public water wetlands is obtained from all riparian owners;

(3) partial drainage or temporary drawdown of public waterbasins and public water wetlands shall be approved only when the applicant has submitted data to confirm:

(a) that the partial drainage will improve navigation or recreational uses;

(b) that the partial drainage will improve or restore fish and wildlife habitat; or

(c) that agricultural lands have been flooded due to artificial obstruction of downstream drainage or increased upstream discharge;

(4) any proposed temporary drawdown shall not exceed two years in duration under normal climatic conditions;

(5) there are no feasible and practical means to attain the intended purpose without drainage; and

(6) the proposal adequately protects public safety and promotes the public welfare.

6115.0272 RELATIONSHIP TO STANDARDS AND CRITERIA FOR OTHER ACTIVITIES INVOLVING CHANGES IN COURSE, CURRENT, OR CROSS-SECTION.

Unless otherwise specified in other parts, parts 6115.0270 and 6115.0271 shall apply to drainage activities proposed as part of any other activity or activities including but not limited to: filling, parts 6115.0190 to 6115.0192; excavations, parts 6115.0200 to 6115.0202; structures, parts 6115.0210 to

6115.0280 ALTERATIONS OF PUBLIC WATERS FOR MINING.

Subpart 1. **Goals.** It is the goal of the department to ensure that alterations of public waters for mining or reclamation of mining areas will minimize adverse environmental effects, preserve water resources to the maximum extent feasible and practical, and encourage the planning of future land and water utilization while at the same time promoting the orderly development of mining and the use of sound mining practices.

Subp. 2. **Scope.** Mining activities which may involve alterations of public waters include the mining of metallic minerals including but not limited to iron ore, taconite, copper, copper-nickel, nickel, cobalt, and gold; and the mining of nonmetallic minerals including but not limited to sand and gravel, stone, clay, marl, oil, gas, and coal; and the mining of peat.

Subp. 3. **Permits required for alterations of public waters.** Permits are required for any alterations of public waters to facilitate mining of iron ore, taconite, copper, copper-nickel, or nickel minerals or reclamation of mining areas provided that:

A. permits to mine are obtained when required by Minnesota Statutes, sections 93.44 to 93.51; and

B. permits for alterations in public waters shall be granted according to Minnesota Statutes, section 103G.297. Applications for permits for alterations in public waters shall include an analysis showing why underground mining without drainage, diversion, or control of public waters is not feasible or economical.

Subp. 4. **Permit required for mining of certain minerals and peat.** Permits are required for mining of nonmetallic minerals, peat, and other metallic minerals not regulated in Minnesota Statutes, section 103G.297, or reclamation of mining areas and shall be granted if the applicant provides evidence that:

A. there is no other feasible and practical location for the proposed mining activity;

B. there is no other feasible or economical method to mine except by draining, diverting, or controlling the public waters;

C. the proposed alteration of public waters is necessary and no other feasible and economical method for it is reasonably available;

D. the proposed alteration of public waters will not substantially impair the interests of the public in lands or waters or the substantial beneficial public use thereof, except as expressly authorized in the permit, and will not endanger public health or safety;

E. the proposed mining operations will be in the public interest and that the public benefits resulting from it will be sufficient to warrant the proposed alteration of public waters;

F. the activities represent the minimal impact solution with respect to watershed modifications, watercourse diversions or changes, drainage, runoff and seepage management, and avoidance of major adverse changes in the ecosystem of public waters having substantial public value;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

G. whenever public watercourses must be diverted or changed to facilitate mining, the design and construction of the diversion or change shall provide for:

(1) maintenance of adequate flows and levels in order to protect instream flows and prevent downstream flooding;

(2) measures to prevent bank erosion and sedimentation in order to protect water quality; and

(3) details on the location, relocation, and utilization of the watercourse after cessation of mining;

H. whenever public waterbasins and public water wetlands are allowed to be drained to facilitate mining, and such drainage is justified and legally permitted, compensation for the loss of the basin is provided for by either:

(1) immediate replacement of the public waterbasins and public water wetlands with waters of equal or greater value; or

(2) submission of acceptable plans for the eventual replacement of the public waterbasins and public water wetlands with waters of equal or greater value upon cessation of mining activities; and

I. whenever a water impoundment is necessary and justified to facilitate mining, the design, construction, operation, and maintenance of the impoundment structure shall:

(1) meet the applicable requirements of parts 6115.0300 to 6115.0520 pertaining to dam safety;

(2) provide hydrologic and hydraulic measures to ensure that any public waters downstream of the impoundment area are adequately protected with respect to maintenance of water quantity and quality and prevention of flooding; and

(3) include plans detailing the disposition and utilization of the impoundment area after cessation of mining activities.

Subp. 5. **Compensatory measures for detrimental aspects of mining.** Whenever metallic, nonmetallic, and peat mining activities in the beds of public waters will result in detrimental effects on the physical and biological character of public waters, measures to compensate for the detrimental aspects shall be required in the permit conditions.

DAMS

6115.0300 PURPOSE AND STATUTORY AUTHORITY.

The purpose of these rules is to regulate the construction and enlargement of dams, as well as the repair, alteration, maintenance, operation, transfer of ownership, and abandonment, in such a manner as to best provide for public health, safety, and welfare. In the application of these parts, the department shall be guided by the policies and requirements declared in Minnesota Statutes, section 84.083, and chapters 103A, 103B, 103E to 103G, and 116D.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

The rules are pursuant to Laws of Minnesota 1978, chapter 779, section 8, and are intended to be consistent with the goals and objectives of applicable federal and state environmental quality programs and policies including, but not limited to, mineland reclamation, and the management of: shorelands, floodplains, water surface use, boat and water safety, wild and scenic rivers, critical areas, recreational or wilderness areas, scientific and natural areas, and protected vegetative species.

To achieve this purpose, the commissioner hereby sets forth minimum standards and criteria for dam classification and identification of hazards to health, safety, and welfare and for permits for dam projects for water and waste impoundments and for ordering repairs.

Statutory Authority: *MS s 103G.515; 103G.531; 105.535*

Posted: *June 11, 2008*

6115.0310 SCOPE.

These parts shall apply to all dams defined in part 6115.0320 unless excluded in other sections of the rules. They are supplementary and complimentary to the rules which establish standards and criteria for granting permits to change the course, current, or cross-section of public waters (parts 6115.0150 to 6115.0210, 6115.230, and 6115.0240 to 6115.0260).

Where these parts conflict with other appropriate rules and requirements, the most restrictive provision shall apply.

All provisions of part 6115.0220 are superseded by these parts as they relate to dams as defined herein, except the section relating to water level controls.

Statutory Authority: *MS s 105.535*

Posted: *June 11, 2008*

6115.0320 DEFINITIONS.

Subpart 1. **Scope.** For the purposes of these parts, certain terms used herein shall be interpreted as follows. These definitions are in addition to those contained in part 6115.0170, except where the same word is contained in both lists of definitions in which case the definitions in these parts shall apply in respect to dam safety administration.

Subp. 2. **Alteration.** "Alteration" means any activity which will affect the safety of a dam and/or which will result in a change in the course, current, or cross-section of public waters.

Subp. 3. **Commissioner.** "Commissioner" means the commissioner of the Department of Natural Resources and any duly authorized representative.

Subp. 4. **Cost.** "Cost" includes labor and materials; preliminary investigations and surveys; construction plant properly chargeable to the project; excluding costs of right-of-way, detached powerhouses, electrical generating machinery, and roads and railroads affording access to the project.

Subp. 5. **Dam.** "Dam" means any artificial barrier, together with appurtenant works, which does or may impound water and/or waste materials containing water except:

A. dams which are less than 25 feet in height and have storage capacity at maximum storage elevation of less than 50 acre-feet, which shall be exempt from dam safety permit requirements if they do not have potential for loss of life resulting from failure or misoperation;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

B. any artificial barrier which is not in excess of six feet in height regardless of storage capacity or which has a storage capacity not in excess of 15 acre-feet regardless of height;

C. underground or elevated tanks to store water and/or waste;

D. any artificial barrier constructed solely for the purpose of containment of sewage or biological treatment of wastewater which is under the jurisdiction of the Minnesota Pollution Control Agency;

E. United States owned dams;

F. dikes and levees constructed for flood control purposes to divert flood waters and which are not intended to act as impoundment structures.

This does not preclude the need for any permits from the commissioner which may be required

under applicable provisions of parts 6115.0200 to 6115.0260 as further explained in part 6115.0340.

Subp. 6. **Enlargement.** "Enlargement" means any change which may raise the maximum storage elevation of the dam.

Subp. 7. **Height.** "Height" means the vertical distance from the natural bed of the stream or watercourse measured at the downstream toe of the dam or from the lowest elevation of the outside limit of the dam, if it is not across a stream channel or watercourse, to the maximum storage elevation.

Subp. 8. **Maintenance.** "Maintenance" means any work which will not result in a change in the hydraulic capacity of the structure or entail any changes in the structural character of the dam.

Subp. 9. **Maximum storage elevation.** "Maximum storage elevation" means the highest elevation to which water or waste materials can be effectively stored behind the dam on either a temporary or permanent basis, whichever is greater.

Subp. 10. **Owner.** "Owner" means the owner or lessee of the property to which the dam is attached, unless the dam is sponsored by a governmental agency which will be responsible for operation and maintenance of the dam, in which case that sponsoring agency shall be considered the owner.

Subp. 11. **Repair.** "Repair" means any work which will change the hydraulic capacity of the structure or entail any changes in the structural character of a dam.

Subp. 12. **Shall.** "Shall" is mandatory and not permissive.

Subp. 13. **Surface.** "Surface" shall be determined by multiplying total dam length by average height.

Subp. 14. **Total dam length.** "Total dam length" means the maximum horizontal distance between the outer limits of all artificial containment structures, including any artificially constructed dike, which are essential to containment, but does not include the length of emergency spillways which are located outside the abutments of the dam.

Statutory Authority: *MS s 105.535*

6115.0330 SEVERABILITY.

The provisions of these rules shall be severable, and the invalidity of any paragraph, subparagraph, or subdivision thereof shall not make void any other paragraph, subparagraph, subdivision, or any other part.

Statutory Authority: *MS s 105.535*

Posted: *June 11, 2008*

6115.0340 CLASSIFICATION OF DAMS.

All existing and proposed dams shall be classified by the commissioner into the following three hazard classes: those dams where failure, misoperation, or other occurrences or conditions would probably result in:

A. Class I: any loss of life or serious hazard, or damage to health, main highways, high-value industrial or commercial properties, major public utilities, or serious direct or indirect, economic loss to the public;

B. Class II: possible health hazard or probable loss of high-value property, damage to secondary highways, railroads or other public utilities, or limited direct or indirect economic loss to the public other than that described in Class III; and

C. Class III: property losses restricted mainly to rural buildings and local county and township roads which are an essential part of the rural transportation system serving the area involved.

Any dam whose failure, misoperation, or other occurrences or conditions would result only in damages to the owner and would not otherwise affect public health, safety, and welfare as described in Classes I, II, and III, shall not be subject to this hazard classification. A dam which is not classified as a hazard Class I, II, or III dam, and those which are not included in the definition of dam at part 6115.0230, subpart 5, definition of dam, shall be subject to applicable provisions of parts 6115.0200 to 6115.0260, and shall not be subject to these dam safety rules. Changes in development in the vicinity of the dam may result in future reclassification.

Statutory Authority: *MS s 105.535*

Posted: *June 11, 2008*

6115.0350 GENERAL PROCEDURES FOR ALTERATION, REPAIR, OR REMOVAL OF A DAM.

Subpart 1. **Application.** Before commencing action, the owner shall make a separate application for each existing dam proposed to be changed upon forms provided by the commissioner, except as provided in subpart 2 for emergencies. The application shall contain:

A. name and address of owner(s);

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

B. proposed changes;

C. maps, plans, and specifications which set forth pertinent details including location, type, dimensions, and storage capacity; and

D. proposed date of start and completion of construction.

A filing fee of $15 shall accompany the application in the form of a check or money order payable to the commissioner of management and budget.

Subp. 2. **Emergency work.** Emergency work:

A. Actions by the owner. Where immediate action is necessary for public health, safety, and welfare, repairs may be started, but the owner shall notify the commissioner at once. As soon as practicable, the owner shall apply for a permit for the emergency necessary permanent repairs.

B. Commissioner's actions. Where necessary to protect public health, safety, and welfare, if the condition of any dam or impoundment is imminently dangerous to the safety or life or property or imminent floods threaten the safety of a dam or impoundment, the commissioner may, in an emergency, require and enforce lowering or completely emptying of the water level from the impoundment and taking any other steps essential to safeguard life and property.

Subp. 3. **Removal.** Before commencing removal, the owner shall comply with the application requirements of subpart 1. After removal, the owner shall submit evidence as to the manner in which the work was performed and the conditions obtained after the removal. The commissioner shall inspect to determine that a sufficient portion of the dam has been removed to eliminate the hazard directly attributable to the presence of the dam.

Statutory Authority: *MS s 105.535*

History: *L 2003 c 112 art 2 s 50; L 2009 c 101 art 2 s 109*

Posted: *August 7, 2009*

6115.0360 INSPECTIONS.

Subpart 1. **Hazard classification.** The commissioner shall make initial inspections of each dam in the state to determine the appropriate hazard classification or exemption according to criteria in part 6115.0340.

Subp. 2. **Dam safety.** The commissioner shall make an initial detailed systematic technical inspection and evaluations of every Class I, II, or III dam in order to assess the general safety conditions including:

A. a review and analysis of available data on the design, construction, and operation;

B. a visual inspection of the dam and downstream and upstream areas:

(1) an examination of significant structural, geotechnical, hydraulic, and hydrologic features including, where applicable, electrical and mechanical equipment for the operation of control facilities;

(2) evidence of leakage, erosion, seepage, slope instability, undue settlement, displacement, tilting, cracking, deterioration, and improper functioning of drains and relief wells; and

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(3) adequacy and quality of maintenance and operating equipment and procedures;

C. a report on general condition including, when possible, an assessment of storage capacity, hydraulic and hydrologic capabilities, structural stabilities, and any other conditions which constitute a hazard based upon current prudent design considering the size and hazard class of the dam.

The safety evaluations involve constraints on water control such as blocked entrances, restrictions on operation of spillway and outlet gates, if any, inadequate energy dissipators or restrictive channel conditions, significant reduction in impoundment capacity by sediment deposits and for waste impoundments, the material balance. Where essential design data are lacking, evaluations of watershed characteristics, rainfall, and impoundment records may be used to evaluate effects of the dam.

The report shall determine the need for emergency measures or actions; corrective actions relating to design, construction, and operation; and additional detailed studies, investigations, and analyses.

Subp. 3. **Timing.** Subject to the availability of staff and funds:

A. The commissioner shall make initial inspections of all Class I, II, and III dams as soon as reasonably possible based on the degree of hazard involved.

B. After the initial detailed inspections, the commissioner shall make periodic inspections of dams based on the following schedule: Class I dams, at least one time every year; Class II dams, at least one time every four years; and Class III dams, at least one time every eight years. The commissioner shall utilize the services of governmental agencies to the maximum extent feasible to provide for periodic inspections.

Subp. 4. **Reports on inspections.** Upon completion of each inspection, the commissioner shall notify the owner of the dam, in writing, of the results of the inspection and if the dam needs corrective action, the commissioner shall order such action.

Statutory Authority: *MS s 103G.515; 105.535*

History: *25 SR 1916*

Posted: *June 11, 2008*

6115.0370 TRANSFER OF DAM OWNERSHIP.

The owner shall not transfer the ownership of any Class I or II dam without a permit from the commissioner. For Class III dams, the owner, or the party to whom a dam is transferred, shall apply to the commissioner for a permit for the transfer of ownership within 30 days after the ownership changes. Permits shall be issued based on evaluation of the hazard class, the conditions, and the financial capabilities of the transferee.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

No state agency or political subdivision may purchase or accept as a gift any privately owned dam subject to department permit requirements until after compliance with the commissioner and legislative action provided in Minnesota Statutes, section 103G.525.

6115.0380 OPERATION AND MAINTENANCE.

Subpart 1. **Responsibilities.** The owner shall operate and maintain the dam. Regulation of maintenance and operation for public health, safety, and welfare is vested with the commissioner.

Subp. 2. **Reports and records.** Owners may be required to keep records and report on maintenance, operation, staffing, and engineering and geologic investigations and any other data necessary to protect the public health, safety, and welfare. In addition, the owner shall fully and promptly advise the commissioner of any unusual or alarming circumstance or occurrence affecting the dam.

Statutory Authority: *MS s 105.535*

Posted: *June 11, 2008*

6115.0390 TERMINATION OF OPERATIONS AND PERPETUAL MAINTENANCE.

Subpart 1. **Owner's duty.** Unless the dam is removed, the owner shall perpetually maintain the dam and appurtenances so as to ensure the integrity of the structure.

Subp. 2. **Financial responsibility.** The commissioner may impose such requirements as may be necessary prior to the ultimate termination of the owner's operation to ensure that the owner will be financially responsible for carrying out the activities required for perpetual maintenance, and that adequate funding will exist.

Subp. 3. **Plans for termination.** In respect to dams utilized for waste disposal, the owner shall prepare and submit to the commissioner plans for termination of operations and perpetual maintenance which will address the owner's plans for both an unanticipated or premature termination of operations and for the ultimate intended termination of operations. The plans for termination of operations and perpetual maintenance shall, at a minimum, address the following issues, where applicable:

A. perpetual maintenance and safety of the dam including adequate monitoring programs;

B. disposal and treatment of ponded and channeled waters;

C. monitoring and mitigation of surface water and groundwater pollution;

D. silt, sedimentation, and erosion control; and

E. vegetation and landscaping.

6115.0400 REPORTS TO LEGISLATURE ON PUBLICLY OWNED DAMS.

As required by Laws of Minnesota 1978, chapter 779, section 7 (Minnesota Statutes, section 103G.511), the commissioner shall make an annual report to the legislature on the status of dams owned

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

by the state or local governmental units which shall include recommendations for action including any requests for state share or matching funds for grants-in-aid to local governments.

Statutory Authority: *MS s 103G.515; 103G.531; 105.535*

Posted: *June 11, 2008*

6115.0410 NEW DAMS OR ENLARGEMENTS.

Subpart 1. **Waivers for Class III dams.** For Class III dams which are sponsored by a governmental agency which will be responsible for operation and maintenance or for which the design, construction supervision, and inspection is performed by a federal agency, the commissioner may waive certain details of the required submittals, provided that the federal agency will furnish the commissioner with adequate facts on the design and construction inspection to allow the commissioner to adequately evaluate the permit and approvals.

Subp. 2. **Permit application.** A separate application, including a preliminary report for each new dam or each dam proposed to be enlarged, shall be filed with the commissioner upon forms provided by the commissioner which shall contain the following:

A. name and address of the owner(s) or prospective owner;

B. purpose;

C. location, type, size, and height of the dam; and

D. storage capacity of the impoundment.

For waste impoundment dams, the permit application shall include facts necessary for the issuance of a permit which extends throughout the life of the impoundment project.

Subp. 3. **Preliminary report.** The preliminary report shall consist of:

A. A general statement setting forth the effect on the environment.

B. Maps showing the location of county, township, and section lines; the outline of the impoundments; the location of state, county, and township roads; the locations of utilities, e.g. pipelines, transmission, telegraph, and telephone lines; the topography; and other structure or facilities including dwellings affected by the proposed dam. State, county, and USGS maps and aerial photographs may be used for this purpose.

C. A written report of surface conditions, i.e. geology, topography, which is based on a field examination by the applicant's engineer and other qualified personnel.

D. Typical cross-sections of the dam accurately showing elevations, proposed impoundment levels, and top width.

E. Logs of borings in the foundation and in the borrow areas, and results of seismic and resistivity subsurface investigations, when they are readily available.

F. Preliminary design assumptions, operational aspects, tentative conclusions, and references. The design assumptions shall pertain to such hydrologic features as drainage area, rainfall data, runoff, inflow, area-capacity-elevation data, and flood routing, in addition to structural, geologic, and geotechnical assumptions.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

G. A preliminary cost estimate.

H. Where applicable, future plans on ultimate project size including dams and impoundments.

I. A general description of all other activities and elements related to and part of the total dam project, such as operational plans and details of smaller dams, dikes, diversions, reclaim water facilities, and other facility and utility lines including pipelines, roads, and railroads. The report shall identify each element or activity of the total dam project which would require a permit under the provisions of parts 6115.0150 to 6115.0260.

Subp. 4. **Filing fees.** Each application for a permit must include a $15 fee in the form of a check or money order payable to the commissioner of management and budget.

Subp. 5. **Professional engineer's requirements.** The applicant must engage professional engineer(s) registered in the state of Minnesota or acting solely as officers or employees of the United States as provided in Minnesota Statutes, section 326.13, clause (3), who are proficient in dam engineering to prepare the engineering documents, plans, and specifications, to inspect the construction, or enlargement, and to establish operation and maintenance procedures for the structure.

Subp. 6. **Final design requirements.** Upon acceptance and agreement by the commissioner of the preliminary report, the applicant shall submit to the commissioner, for approval, a final design report, together with plans and specifications and the initial inspection fee. The final design report shall include, but is not limited to, the following:

A. general description of the project, such as its service life, production rates, required storage and area(s); geological considerations such as physiography, topography, geology, seismicity, groundwater conditions, and maps; hydrologic studies such as physical features, climatology, design, storm and design flood characteristics, flood routing, water-material balance, free-board requirements, dam-break flood; geotechnical information, such as rock-soil sampling and logging, geophysical investigations, field and lab testing, instrumentation data; considerations of construction materials and their properties, such as quantities required, borrow and aggregate locations and volumes, field and lab work and investigations, concrete, waste materials generation and placement techniques, investigation of the stored waste materials such as generations, transportation, mechanical/chemical/special testing, disposal practice;

B. analytical determinations, such as seepage and underseepage studies, stability, deformation and settlement analysis; analytical and design details of facilities, such as dam, foundation, impoundment, abutments, spillways (for the purpose of these rules, spillway means any facility appurtenant to the dam available to discharge excess water and/or waste from the impoundment) or decant facilities, diversions, outlet works, instrumentation; operational aspects, such as impoundment operating criteria, initial filling criteria, responsibility and coordination, emergency procedures and warning systems: air, water, and solid pollution controls, sedimentation, and erosion controls: operational and postoperational maintenance and abandonment considerations; surveillance and inspection programs; and

C. a detailed cost estimate.

Subp. 7. **Plans and specifications.** Plans shall consist of a bound portfolio of the drawings with all sheets being of the same size, and shall be of such scale that specifications can be drafted, and construction accomplished. Specifications shall contain:

A. general provisions, specifying the rights, duties, responsibilities of the owner, designer, contractor; the prescribed order of work;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

B. technical provisions describing approved work methods, equipment materials, and desired end results; and

C. special conditions.

Subp. 8. **Permit standards.** Approval or denial shall be based on the potential hazards to the health, safety, and welfare of the public and the environment including probable future development of the area downstream or upstream. The applicant may be required to take measures to reduce risks, and the commissioner shall furnish information and recommendations to local governments for present and future land use controls to minimize risks to downstream areas.

The commissioner shall determine if the proposal is adequate with respect to:

A. For Class I, a showing of lack of other suitable feasible and practical alternative sites, and economic hardship which would have a major adverse effect on population and socioeconomic base of the area affected.

B. For Class II, a showing of lack of other suitable feasible and practical alternative sites and that the dam will benefit the population or socioeconomic base of the area involved.

C. The need in terms of quantifiable benefits.

D. The stability of the dam, foundation, abutments, and impoundment under all conditions of construction and operation, including consideration of liquefaction, shear, or seepage failure, overturning, sliding, overstressing and excessive deformation, under all loading conditions including earthquake. This determination must be based on current, prudent engineering practice, and the degree of conservatism employed must depend on hazards.

E. Discharge and/or storage capacity capable of handling the design flood based on current, prudent engineering practice and the hazard classification.

F. Compliance with prudent, current environmental practice throughout its existence.

Subp. 9. **Work inspection and construction reports.** Work inspection and construction reports:

A. Conformity with approved designs, plans, and specifications.

(1) The permittee shall be responsible for providing adequate controls of construction and operation activities and for the development of data in the ordinary course of those activities on design, construction, and operation assumptions. The owner may engage a professional engineer to operate and inspect the construction, but the designer should also periodically monitor construction.

(2) All construction shall be carried out in accordance with the approved design, plans, and specifications. No alteration, modification, or addition to the approved designs, plans, and specifications that could adversely affect the safety or environmental impact of the dam shall be made by the permittee without prior permission of the commissioner. Such approvals shall be provided, if a proper margin of safety is maintained, as rapidly as possible to preclude interference with construction work schedules. Emergency short-term revisions may be made by the permittee followed by prompt notice to the commissioner. Records of alterations, modifications, or additions to the approved design, plans, and specifications, for which written approval of the commissioner was not required shall be submitted with the construction report as provided in item C.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(3) The commissioner shall make inspections for the purpose of securing conformity with approved designs, plans, and specifications and shall require the owner to perform, at the permittee's expense, work or tests as found necessary to disclose sufficient information to determine if there is conformity.

(4) If, at any time as work progresses, the commissioner finds that changes are necessary to protect health, safety, welfare, and the environment, the commissioner shall order the owner to revise designs, plans, and specifications.

(5) At the commissioner's discretion, the commissioner may observe and approve foundation preparation and may approve construction material placement on an intermittent or continuing basis when field conditions dictate. The commissioner shall be notified at least three days in advance of start of construction.

B. Permanent markers. At least one permanent marker for vertical and horizontal control shall be established in the natural ground by the permittee in the vicinity of each dam so as to be accessible and protected against disturbance throughout its existence. The permanent marker for vertical control must be based upon datum and degree of accuracy based upon considerations of the hazards involved and the size of the dam, as specified by the commissioner.

The permittee shall submit the locations of these permanent markers plotted on the best available maps or plans within time limits prescribed in the permit.

C. Construction report. The permittee may be required to submit monthly reports on construction observation and quality control, when construction is complex or hazardous, including: daily construction documentation; foundation preparation and treatment, quality control tests; records and summaries of actual tests of foundation and construction materials, cutoff trench, grouting, etc; instrumentation installation and maintenance of records and readings; geologic mapping, if any, of exposed foundations; of logs of drill holes and other exploration features, if any, completed during construction; review and evaluation of disclosed field conditions by the designer; and any other items which may be pertinent to a construction quality assurance program.

Subp. 10. **As-built plans and data.** Immediately upon completion of construction the permittee shall file supplementary drawings or descriptions of the dam as actually constructed, or any other items which may be of permanent value bearing on the adequacy and permanency of the dam. In enlargements the data need apply only to the new work.

Subp. 11. **Statement of completion and affidavit of cost.** Within 90 days following completion of construction, the permittee shall notify the commissioner, by certified mail, including a statement of the designer or professional engineer in charge of construction inspection that to the best of knowledge the dam was completed in accordance with the approved designs, plans, and specifications and any revisions thereof.

As soon as practicable thereafter, the permittee shall file an affidavit stating the actual cost in detail or that the permittee is unable to report the actual cost stating the reasons therefor. In the latter event the commissioner shall make at the owner's expense an appraisal of the cost of construction or enlargement and determine what further fee, if any, is required. If a further fee is required, the commissioner shall notify the owner by certified mail of the amount within 15 days including notice that permittee may appear

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

within 60 days thereafter to protest the amount of the fee, in whole or in part and the sufficiency of the appraisal upon which such determination was based.

Subp. 12. **Issuance of impoundment approval.** Impoundment approvals may be necessary for Class I and Class II dams to allow adequate time for inspection before actual impoundment begins.

The type, location, hazard involved, and the purpose served by the dam will be considered in respect to the degree and nature of impoundment approval needed. Certain waste disposal dams which will not be constructed to maximum storage elevation in five years will require a series of impoundment approvals for various stages of construction.

Pending issuance of an impoundment approval (or reissuance in the event of termination) where required the owner of the dam shall not, through action or inaction, allow an impoundment.

The impoundment approval shall contain such terms and conditions as the commissioner may prescribe.

The commissioner may also revoke or amend the terms and conditions of any approval.

Subp. 13. **Performance reports.** The permittee may be required in the case of complex or hazardous dams to submit yearly a performance report detailing the instrumentation data and analysis and interpretation of these data as they relate to the safety of the dam and design assumptions. The frequency of submission may be modified if field conditions so dictate.

6115.0430 LIABILITY OF OWNER AND PERMITTEE.

Nothing in these parts shall be construed to relieve an owner of a dam or permittee of the legal duties, obligations, or liabilities incident to the ownership or operation of the dam.

Statutory Authority: *MS s 105.535*

Posted: *June 11, 2008*

6115.0440 OWNER'S RIGHTS.

Nothing in these parts shall be construed to deprive any owner of such recourse to the courts.

Statutory Authority: *MS s 105.535*

Posted: *June 11, 2008*

6115.0450 INSPECTIONS.

Owners of dams shall allow the commissioner prompt access to and inspection of all records, plants, structures, facilities, and operations at all reasonable times. Entry is subject to reasonable compliance with the owner's safety rules and avoidance of unreasonable impairment of or interference with construction and operation. Inspection shall be limited to testing and observing rather than supervising and shall not relieve the owner from the full responsibility of providing adequate inspection and supervision.

Statutory Authority: *MS s 105.535*

Posted: *June 11, 2008*

6115.0460 COMPLIANCE WITH OTHER LAWS.

The owner of a dam shall comply with all other state and federal laws and regulations and shall obtain such other permits as may be required including particularly any laws and rules regarding mineland reclamation.

Statutory Authority: *MS s 105.535*

Posted: *June 11, 2008*

6115.0470 ACQUISITION OF PROPERTY.

Where activities authorized by a permit involve the rights or interests of any other persons, or of any public interests, the permittee, before proceeding, shall acquire all necessary interests or permissions, including paying the costs of the alteration, relocation, or replacement of any publicly owned facility.

6115.0480 ASSIGNMENT OF PERMITS.

Permits may be assigned in whole or in part only if the commissioner is notified and approves the assignment in writing. Provisions of the permit shall extend to and bind the successors in authority of the commissioner and the legally assigned successors in interest of the permittee.

Statutory Authority: *MS s 105.535*

6115.0490 WARNING SYSTEMS AND EMERGENCY PROCEDURES.

Class I dam owners shall prepare and file for approval a contingency plan for notifying any persons whose lives, property, or health may be endangered by failure, misoperation, or other circumstances or occurrence affecting the dam, identifying most practical and expeditious means for warning considering the time factor involved based on the proximity of the dam to affected parties. If there is no feasible or practical means to provide for adequate evacuation warning in sufficient time if a catastrophe occurs the owner shall be responsible for notifying affected downstream property owners of that fact.

Statutory Authority: *MS s 105.535*

Posted: *June 11, 2008*

6115.0500 PERMIT AND HEARING PROCEDURES.

Parts 6115.0300 to 6115.0520 are subject to the permit and public hearing provisions of Minnesota Statutes, sections 103G.251, 103G.295, 103G.297, and 103G.301 to 103G.315, including:

A. The commissioner must act on permit applications within 30 days of the time that all required data and fees are filed in the commissioner's office.

B. The commissioner may cancel or modify a permit at any time if the commissioner deems it necessary for any cause for the protection of the public interests.

C. Whether or not a dam is under permit, on determining that it is unsafe or needs repair or alteration, the commissioner shall notify the owner to repair, alter, or remove the dam as the exigencies of the case may require.

D. An order requiring immediate action is effective on the date thereof, but shall not be in effect for more than 30 days from that date unless the permittee is on the same date mailed written notice of the order which includes notice of a Minnesota Statutes, section 103G.311, public hearing on a date not more than 30 days from the date of the notice.

E. If at any time during construction of a project, the commissioner finds that the work is not being done in conformance with approved designs, plans, and specifications, except as provided in part 6115.0410, subpart 9, item A, subitem (2), the commissioner shall notify the permittee and shall order immediate compliance and may order that no further work be done until such compliance has been effected and approved.

F. If the permittee fails to comply with approved designs, plans, and specifications or if conditions are revealed which will not permit the construction of a safe dam, the permit may be revoked.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

G. Initiating any work by the permittee, authorized in an issued permit or approval, constitutes acceptance of all terms and conditions contained therein.

6115.0520 INSPECTION FEES.

Subpart 1. **Exemption.** No inspection fee shall be charged for dams owned or sponsored by a governmental agency or for any Class III dam for which the design, construction supervision, and inspection is provided by a federal agency.

Subp. 2. **Fee schedule.** The initial fee required by part 6115.0410, subpart 6 shall be based on the following formula and no fees pursuant to parts 6115.0010 to 6115.0040 shall be charged:

A. for the first $100,000 of estimated cost (as defined in part 6115.0320, that portion of engineering evaluations and studies relating to safety which is also part of the final design report performed for the applicant which were included with environmental assessment worksheets and with environmental impact statements required by law shall be subtracted provided that the applicant provides a notarized detailed accounting of expenditures), a rate of 2-1/2 percent;

B. for the next $400,000, 1-1/2 percent;

C. for the next $500,000, one percent;

D. one-half of one percent of all costs in excess of $1,000,000; and

E. if the final total cost exceeds the estimate, the difference as provided in part 6115.0410, subpart 11.

For dams which will not be constructed to maximum storage elevation within five years of the date construction begins (such as dams for storage of mining waste materials) computation will be based on applicant's work schedule outlining proposed staging and a certified estimate of costs based on staging and a certified estimate of costs based on staging intervals not exceeding five years in duration. At the end of each stage, or at intervals not exceeding five years in duration, until completion, the applicant shall file

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

an affidavit of actual costs for each stage or interval not exceeding five years. Whenever the actual costs exceeds the estimate the applicant shall pay the difference.

Subp. 3. **Periodic fees.** Periodic fees shall be charged to owners for each year and inspection is made pursuant to part 6115.0360, subpart 3, of $30 per dam plus an additional fee based on surface (as defined in part 6115.0320) of $0.01 per square foot for the first 1,000 and $0.001 for each square foot in excess of 1,000, payable on or before the end of the state fiscal year, June 30.

Subp. 4. **Annual records.** The commissioner shall keep annual records of inspection costs which shall be provided upon request of any applicant who paid inspection fees.

Statutory Authority: *MS s 105.535*

WATER APPROPRIATION AND USE PERMITS

6115.0600 POLICY.

The purpose of these parts is to provide for the orderly and consistent review of permit applications for appropriation and use of waters of the state in order to conserve and utilize the water resources of the state in the public interest. In the application of these parts, the Department of Natural Resources shall be guided by the policies and requirements declared in Minnesota Statutes, section 84.083, and chapters 103A, 103B, 103E to 103G, and 116D.

Any appropriation must be consistent with laws and rules of federal, state, and local governments.

Statutory Authority: *MS s 103G.515; 103G.531; 105.535*

Posted: *June 11, 2008*

6115.0610 PURPOSE AND STATUTORY AUTHORITY.

These parts set forth minimum standards and criteria pertaining to the regulation, conservation, and allocation of the water resources of the state, including the review, issuance, and denial of water appropriation applications and the modification, suspension, or termination of existing permits.

Further provisions for the administration of these parts are found in Minnesota Statutes, section 84.083, and chapters 103A, 103B, and 103E to 103G. Permits for water appropriation for mining shall be in agreement with provisions of Minnesota Statutes, section 103G.297.

Statutory Authority: *MS s 103G.515; 103G.531; 105.535*

Posted: *June 11, 2008*

6115.0620 SCOPE.

Permits shall be required for, and these parts shall apply to, any appropriation of waters of the state, except for the following:

A. Appropriation of water for domestic uses serving less than 25 persons for general residential purposes.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

B. Test pumping of a groundwater source.

C. Withdrawal for any use at a rate not to exceed 10,000 gallons per day and totaling no more than 1,000,000 gallons per year.

D. Agricultural field tile or open ditch drainage systems, including pumping, to remove water from crop lands. This shall not preclude the need for compliance with Minnesota Statutes, chapter 103E and for permits for changes in course, current, or cross-section of public waters in the event that the agricultural drainage system adversely affects public waters. Adverse effects on public waters may include partial or complete drainage of public waters, high water or flooding conditions on surrounding lands, and accelerated erosion and sedimentation.

E. Reuse and discharge of waters resulting from an appropriation of waters of the state for which a permit has been granted, subject to applicable laws, and rules of other state and federal governmental agencies.

Statutory Authority: *MS s 103G.515; 103G.531; 105.535*

History: *L 1985 c 172*

Posted: *June 11, 2008*

6115.0630 DEFINITIONS.

Subpart 1. **Scope; shall.** For the purpose of these rules, the terms or words defined in this part have the meanings given therein, except where the context clearly indicates otherwise. The word "shall" is mandatory, not permissive.

Subp. 2. **Aquifer.** "Aquifer" means any water-bearing bed or stratum of earth or rock capable of yielding groundwater in sufficient quantities that can be extracted.

Subp. 3. **Appropriation.** "Appropriation" shall have the meaning prescribed in Minnesota Statutes, section 105.37, subdivision 5, "appropriation includes but is not limited to taking, regardless of the use to which the water is put."

Subp. 4. **Artesian aquifer or confined aquifer.** "Artesian aquifer" or "confined aquifer" means a water body or aquifer overlain by a layer of material of less permeability than the aquifer. The water is under sufficient pressure so that when it is penetrated by a well, the water will rise above the top of the aquifer. A flowing artesian condition exists when the water flow is at or above the land surface.

Subp. 5. **Basin.** "Basin" means a depression capable of containing water which may be filled or partly filled with waters of the state. It may be a natural, altered, or artificial depression.

Subp. 6. **Commissioner.** "Commissioner" refers to the commissioner of the Department of Natural Resources or the commissioner's authorized representative.

Subp. 7. **Consumptive use or consumption.** "Consumptive use" or "consumption" refers to water withdrawn and not directly returned to the same waters as the source for immediate further use in the area.

Subp. 8. **Division.** "Division" means the Division of Waters, Department of Natural Resources.

Subp. 9. **Domestic use.** "Domestic use" means use for general household purposes for human needs such as cooking, cleaning, drinking, washing, and waste disposal, and uses for on-farm livestock watering excluding commercial livestock operations which use more than 10,000 gallons per day and 1,000,000 gallons per year.

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

Subp. 10. **Dug pit.** "Dug pit" means an artificial excavation such as sump, trench, pond, water hole, or other basin constructed for the purpose of intercepting and capturing surface and ground water, and often involving groundwater under water table or unconfined conditions.

Subp. 11. **Groundwater.** "Groundwater" means subsurface water in the saturated zone. The saturated zone may contain water under atmospheric pressure (water table condition), or greater than atmospheric pressure (artesian condition).

Subp. 12. **Protected flow.** "Protected flow" is defined as the amount of water required in the watercourse to accommodate instream needs such as water-based recreation, navigation, aesthetics, fish and wildlife habitat, water quality, and needs by downstream higher priority users located in reasonable proximity to the site of appropriation.

Subp. 13. **Protection elevation.** "Protection elevation" is defined as the water level of the basin necessary to maintain fish and wildlife habitat, existing uses of the surface of the basin by the public and riparian landowners, and other values which must be preserved in the public interest.

Subp. 14. **Public water supply.** "Public water supply" refers to the various supplies of water used primarily for domestic supply purposes and obtained from a source or sources by a municipality, a water district, a person, or corporation where water is delivered through a common distribution system, as further defined in Minnesota Statutes, section 144.382, subdivision 4.

Subp. 15. **Safe yield for water table condition.** "Safe yield for water table condition" means the amount of groundwater that can be withdrawn from an aquifer system without degrading the quality of water in the aquifer and without allowing the long term average withdrawal to exceed the available long term average recharge to the aquifer system based on representative climatic conditions.

Subp. 16. **Safe yield for artesian condition.** "Safe yield for artesian condition" means the amount of groundwater that can be withdrawn from an aquifer system without degrading the quality of water in the aquifer and without the progressive decline in water pressures and levels to a degree which will result in a change from artesian condition to water table condition.

Subp. 17. **Water table aquifer or unconfined aquifer.** "Water table aquifer" or "unconfined aquifer" means an aquifer where groundwater is under atmospheric pressure.

Subp. 18. **Waters of the state.** "Waters of the state" means any waters, surface or underground, except those surface waters which are not confined but are spread and diffused over the land. "Waters of the state" includes all boundary and inland waters (Minnesota Statutes, section 103G.005, subdivision 17).

Subp. 19. **Watercourse.** "Watercourse" means any natural, altered, or artificial channel having definable beds and banks capable of conducting confined runoff from adjacent lands (Minnesota Statutes, section 103G.005, subdivisions 3, 5, and 13).

Subp. 20. **Well.** "Well" means any excavation that is drilled, cored, bored, washed, driven, dug, jetted, or otherwise constructed where the intended use is for the location, diversion, or acquisition of groundwater (Minnesota Statutes, section 103I.005, subdivision 21).

6115.0640 COORDINATION WITH OTHER AGENCIES.

Nothing in these parts is intended to supersede or rescind the laws, rules, regulations, standards, and criteria of other international, federal, state, regional, or local governmental subdivisions with the authority to regulate the appropriation of waters of the state. The issuance of a permit shall not confer upon an applicant the approval of any other unit of government for the proposed project. The department shall coordinate the review of permit applications with other units of government having jurisdiction in such matters.

Statutory Authority: *MS s 105.535*

Posted: *June 11, 2008*

6115.0650 SEVERABILITY.

The provisions of these rules shall be severable, and the invalidity of any paragraph, subparagraph, or subdivision thereof, shall not make void any other paragraph, subparagraph, subdivision, or any other part.

Statutory Authority: *MS s 105.535*

Posted: *June 11, 2008*

6115.0660 APPLICATION FOR PERMIT.

Subpart 1. **Requirement.** Applications shall be submitted for each surface or ground water source from which water is proposed to be appropriated. A separate application shall be required for the following:

A. for each distribution system if the water is used in more than one common distribution system;

B. for each well(s) completed in different aquifers if groundwater is to be appropriated from separate wells completed in more than one aquifer; and

C. for each basin or watercourse involved if surface water is to be appropriated from several different basins or watercourses.

Subp. 2. **Evidence of ownership.** The applicant must provide written evidence of ownership, or control of, or a license to use, the land overlying the groundwater source or abutting the surface water source from which water will be appropriated.

Subp. 3. **Information required.** All applicants shall submit the following information when it is reasonably available. Additional submittals may be required as prescribed in parts 6115.0680 to 6115.0720 and where deemed necessary by the commissioner in order to adequately evaluate the applications:

A. A completed application on forms supplied by the commissioner.

B. The required application fee (Minnesota Statutes, sections 103G.301, subdivisions 2 to 5, and 103G.315, subdivision 12).

C. Aerial photographs, maps, sketches, detailed plat, topographic maps, or other descriptive data sufficient to show:

(1) the location of the area of use;

(2) the outline of the property owned, or controlled by the applicant in proximity to the area of use;

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(3) the location of the proposed point of appropriation such as well(s) location, stream bank pump(s) or the location of other facilities for appropriation of water;

(4) if ground water is involved, the location of test hole borings which have been drilled on the property from which the appropriation will be made.

D. Signed statement that copies of the application and accompanying documents have been sent to the mayor of the city, secretary of the board of supervisors of the soil and water conservation district, or the secretary of the board of managers of the watershed district if the proposed project is within a city or within or affects a watershed district or soil and water conservation district or a city (Minnesota Statutes, section 103G.301, subdivision 6).

E. Statement of justification supporting the reasonableness and practicality of use with respect to adequacy of the water source, amounts of use, and purposes, including available facts on:

(1) hydrology and hydraulics of the water sources involved, including for surface waters the applicant's analysis of the effect of proposed withdrawals on levels and flows and anticipated impacts, if any, on instream flow or lake level conditions to the extent that such facts are not already available to the commissioner;

(2) proposed pumping schedule including rates, times, and duration;

(3) amounts of water to be appropriated on a maximum daily, monthly, and annual basis;

(4) means, methods, and techniques of appropriation;

(5) alternative sources of water or methods which were considered, to attain the appropriation objective and why the particular alternative proposed in the application was selected.

F. Information on any water storage facilities and capabilities and any proposed reuse and conservation practices.

G. Application for use of surface water shall include the following additional data:

(1) A contingency plan which describes the alternatives the applicant will utilize if at any time appropriation is restricted to meet instream flow needs or to protect the level of a basin. The contingency plan shall be feasible, reasonable, and practical; otherwise the applicant shall submit as part of the application a written statement agreeing in such case to withstand the results of no appropriation (Minnesota Statutes, section 103G.285, subdivision 6).

(2) For appropriation from natural basins or natural watercourses, facts to show that reasonable alternatives for appropriating water have been considered including use of water appropriated during high flows and levels and stored for later use and the use of ground water.

(3) For basins less than 500 acres in surface area the applicant shall notify all riparian landowners and provide the commissioner with a list of all landowners notified; attempt to obtain a signed statement from as many riparian landowners as the applicant is able to obtain stating their support to the proposed appropriation; and provide an accounting of number of signatures of riparian owners the applicant is unable to obtain (Minnesota Statutes, section 103G.285, subdivision 4).

H. Application for use of groundwater, except for agricultural irrigation (part 6115.0680) shall include the following data:

(1) test hole logs (if any) and water well record(s);

(2) hydrologic test data; and

(3) hydrologic studies, if the above data are insufficient to allow the commissioner to properly assess the capability of the aquifer system in the area of withdrawal or are inadequate to allow assessment of the effects of the proposed appropriation on the water resource and on nearby wells.

Subp. 4. **Waiver.** Whenever information required by parts 6115.0660 and 6115.0680 to 6115.0720 is unnecessary or inapplicable, the commissioner shall waive those requirements.

6115.0670 COMMISSIONER'S ACTIONS ON PERMIT APPLICATIONS.

Subpart 1. **In general.** Upon receipt of the information required from the applicant under parts 6115.0660 and 6115.0680 to 6115.0720, where applicable, the commissioner shall take action on the application as follows.

Subp. 2. **Review and analysis of data.** Review and analysis of data:

A. The commissioner shall consider the following factors, as applicable:

(1) the location and nature of the area involved and the type of appropriation and its impact on the availability, distribution, and condition of water and related land resources in the area involved;

(2) the hydrology and hydraulics of the water resources involved and the capability of the resources to sustain the proposed appropriation based on existing and probable future use;

(3) the probable effects on the environment including anticipated changes in the resources, unavoidable detrimental effects, and alternatives to the proposed appropriation;

(4) the relationship, consistency, and compliance with existing federal, state, and local laws, rules, legal requirements, and water management plans;

(5) the public health, safety, and welfare served or impacted by the proposed appropriation;

(6) the quantity, quality, and timing of any waters returned after use and the impact on the receiving waters involved;

(7) the efficiency of use and intended application of water conservation practices;

(8) the comments of local and regional units of government, federal and state agencies, private persons, and other affected or interested parties;

(9) the adequacy of state water resources availability when diversions of any waters of the state to any place outside of the state are proposed;

(10) the economic benefits of the proposed appropriation based on supporting data when supplied by the applicant.

B. The commissioner shall further consider the following factors for appropriation from watercourses:

(1) historic streamflow records, and where streamflow records are not available, estimates based on available information on the watershed, climatic factors, runoff, and other pertinent data;

(2) physical characteristics such as discharge, depth, and temperature, and an analysis of the hydrologic characteristics of the watershed;

(3) aquatic system of the watercourse, riparian vegetation, and existing fish and wildlife management within the watercourse;

(4) frequency of occurrence of high and low flows;

(5) feasibility and practicability of off-stream storage of high flows for use in providing water supply during periods of normal low flows, when supply is limited by existing and anticipated use.

C. The commissioner shall further consider the following factors for appropriation from basins:

(1) total volume of water within the basin;

(2) slope of the littoral zone;

(3) available facts on historic water levels of the basin and other relevant hydrologic factors;

(4) cumulative long-range ecological effects of the proposed appropriation;

(5) natural and artificial controls which affect the water levels of the basin.

D. The commissioner shall further consider the following factors for appropriation of groundwater:

(1) type and thickness of the aquifer;

(2) subsurface area of the aquifer;

(3) area of influence of the proposed well(s);

(4) existing water levels in the aquifer and projected water levels due to the proposed appropriation;

(5) other hydrologic and hydraulic characteristics of the aquifer involved; and

(6) probable interference with neighboring wells.

Subp. 3. **Decision on applications.** The commissioner is authorized to grant permits, with or without conditions, or deny them. In all cases, the applicant, the managers of the watershed district, the board of supervisors of the soil and water conservation district, or the mayor of the city may demand a hearing in the manner specified in Minnesota Statutes, section 103G.311, subdivision 5, within 30 days after receiving mailed notice outlining the reasons for denying or modifying an application.

Decisions by the commissioner are further subject to the administrative provisions of Minnesota Statutes, sections 103G.241, 103G.251, 103G.295, 103G.297, and 103G.301 to 103G.315. These sections include information and requirements on procedure, authority, timing of actions, fees, notice, investigations, violations and penalties, and special provisions regarding mining operations.

Based on these statutory requirements and other applicable provisions of Minnesota Statutes, section 84.083, and chapters 103A, 103B, and 103E to 103G, the commissioner shall make decisions as follows:

A. No permit shall be granted if:

Copyright ©2008-2010 by the Revisor of Statutes, State of Minnesota. All Rights Reserved.

(1) for application involving diversion of any waters of the state, surface or ground water, to a place outside the state, the remaining waters in the state will not be adequate to meet the state water resources needs during the specified life of the diversion (Minnesota Statutes, section 103G.265, subdivision 2);

(2) there is no conflict between competing users but the quantity of available waters of the state, in the area involved, are inadequate to provide the amounts of water proposed to be appropriated;

(3) the appropriation is not reasonable, practical, and does not adequately protect public safety and promote the public welfare (Minnesota Statutes, section 103G.315);

(4) the appropriation is not consistent with approved state, regional, and local water and related land resources management plans, provided that regional and local plans are consistent with statewide plans (Minnesota Statutes, section 103G.271, subdivision 2);

(5) there is an unresolved conflict between competing users for the waters involved and the conflict has not been resolved pursuant to provision of part 6115.0740.

B. Approval of any surface water appropriation application shall be further subject to the following:
